2325. Re: Kenwood Tm741A Mods needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 15:05:05 UTC
From: stevew@netcom.com
Message-ID: <84sk+9-.stevew@netcom.com>
Source record: 289738

A buddy of mine just acquired a TM-741. He was pretty happy witg the feature set, etc. but ran into one rather bothersome behavior that has caused him to send the rig back for repair.

He was getting constant complaints for being off-frequency on 440. After some investigation it became apparent that the radio was drifting up to 4.5Khz over any 10 minute period. He went to look at the stability specs on the rig and found them to be 10 parts-per-million(10ppm). Well, 10ppm at 440Khz is 4.4Khz! This just doesn't seem usable...even in the amateur service. I looked at the specs on my Yaesu FT736 (a multi-mode multi-band rig) and it has a spec of 1ppm(a bit more reasonable..)

My friend sent the rig back to the shop he bought it from and the in-house tech WAS able to repeat the problem so they promised to send it back to Kenwood even though it is technically in spec. About a week later my friend got a call informing him that there were 3 other 741's that have been returned for the same reason.

I'm curious about whether others are having similar problems?

Steve KA6S

2326. Correction to QST TC item

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 15:17:49 UTC
From: jbloom%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <687@arrlhq.UUCP>
Source record: 289756

Here is an upcoming QST item regarding the April 1992 "Technical Correspondence" piece, "Accurate Single-Layer Solenoid Inductance Calculations." This is the manuscript, so there may be a few minor editorial corrections in the final version. There are typesetting marks embedded in the text, too. Particularly, \1/ means superscript 1 (i.e., footnote 1) and /1\ means subscript 1. -- KE3Z

CORRECTIONS TO ACCURATE SINGLE-LAYER
INDUCTANCE CALCULATIONS [bf]

[] There are a few pecadillos in my April issue article\1/ and I'd like to get the information corrected as soon as possible. The errors are all mine and I should have caught them.

Please make the following corrections:

o Under Equation 2, replace "p = coil pitch" with "p = coil pitch [b/N]." This is the way they defined it in the older days, apparently.

o Replace "d= coil diameter (wire center to wire center)" with "d = wire diameter." Remove the original parenthetical expression.

o In the second column, the sentence "Nagoka's constant for short coils (d/l less than one) is:" should read "Nagoka's constant for short coils (2a/b greater than one) is:"

o Below equation 5, replace "B = coil diameter/coil length" with "B = coil length/mean coil diameter (2a)."

o In the last sentence in column 2, the parenthetical expression "(d/l greater than one)" should read "(2a/b less than one)."

o The correct value for Wheeler's approximation in Fig 1C is 163.265, not 132.7 nH.

o Equations 7 and 8 both require a negative exponent. The curve fit is good, but accuracy suffers with values in the region of one to two. Use Equation 7 when 2a/b is greater than 2; use Equation 8 when 2a/b is less than 2.

K/s\ = 0.9694 (2a/b)^-0.6932 (Eq 7)

K/L\ = 0.9617e^[-0.2913(2a/b)] (Eq 8)

o I have provided Table 1 which contains the actual values one needs to check out the equations. The graphs supplied in the original article are incorrect and have insufficient resolution to verify results.

Here's some additional information: For the larger wire sizes, and relatively small diameters, the inductance increases because the mean coil diameter is the mandrel diameter plus the wire diameter. Therefore, the coil diameter increases more rapidly with larger wire sizes if the mandrel size is relatively small. This is important to realize if drill shanks are used as mandrels. Mandrel diameter is the same as winding diameter and not equal to 2a.

Brian Beezley, K6STI, has written a compiled BASIC program that calculates the inductance values. There are minor differences with the results obtained when using the program and the numbers in Table 1; those differences are due to rounding. Brian has uploaded the program (IND.EXE) to the ARRL BBS (203-665-0090). With the program, the number of coil turns is limited to 999.99. [I can mail a uuencoded copy of the program to anyone who wants it. -- KE3Z]

Some correspondents, notable Mike Tuggle, N3HZK, and Charles Michaels, W7XC, correctly point out that the true inductance of a coil can be significantly different from its effective inductance at the terminals. This is due to several other considerations necessary to the realization of a specific coil design. These include: distributed capacitance, C/o\, pigtail lead inductance and capacitance, Q, grounding one end of the coil, closeness to shielding, self-resonance effects, etc. I felt that the topic of true inductance was complex enough by itself, and as such, left realization considerations as another topic for discussion.

Several respondents have presumed that since the formulations were generated at the turn of the century that they are only applicable to frequencies in the tens of kilohertz region. This is not so. There are no frequency dependent terms used in the calculation of inductance unless the wire is made of magnetic material. Then, these effects, for the most part, become negligible above 500 kHz.

I hope this clarifies any questions readers have, and I apologize for any inconvenience the errors may have caused.--Hank Meyer, W6GGV, 3801 Walnut Ave, Long Beach, CA 90807

Table 1
Inductance Values for Short,
Equal Length/Diameter and Long Coils [bf]

Short coils--winding diameter = 0.5, L = 0.25, TPI = 16 N = 4

Wire Size Inductance (nH)

16 224.7
18 222.02
20 228.5
22 231.96
24 236.17
26 241.0
28 246.35
30 252.03

(Simple approximation yields 210.53 nH.)

Equal Length/Diameter coils--Diam = 0.5, l = 0.5, TPI = 8, N = 4

Wire Size Inductance (nH)

14 163.9
16 165.57
18 168.32
20 171.93
22 176.80
24 181.22
26 186.61
28 142.42
30 198.45

(Simple approximation yields 137.93 nH.)

Long coils--Winding Diam - 0.25, b = 0.5, TPI = 16, N = 8

Wire Size Inductance (nH)

16 205.56
18 200.93
20 198.79
22 198.58
24 199.91
26 202.44
28 205.95
30 210.16

(Simple approximation yields 163.267 nH.)

I know of no modifications to accomplish what you wish. There was a
note circulating the entire month of April claiming to have such a mod;
it has been admitted to be a hoax.

>B. Red, violet, yellow and peach
>C. Violet, blue, orange and red
>D. Red, green, orange and yellow
>
>The official answer is 'D', however 'A' is also correct.
>

Sheesh! So such knowledge is supposed to be indicative of an
"advanced" communications user. Sounds like a Jeopardy! question
to me.

Questions like these really trivialize the licensing program and
serve as visible proof that the VEC program is doomed. We're in
sad shape when a question such as this could be considered the
make/break factor in granting someone and advanced class license.

I'll bet that half of those who memorized the answer from the study
guide could not answer the following question which isn't on the
test:

4XX-X.X What does the term LED stand for?
A. Longwire Energized Dipole
B. Legal Emission Designator
C. Longitude Electronic Distance
D. Lightweight Envelope Dispenser

The correct answer is: NONE, get a CLUE and just memorize the stupid
book. By next year you'll be shouting AMERICA AMERICA SIXPACK SANTIAGO
ZANZIBAR at the top of your lungs into a brand new kilowatt rice box
anyway. If it ever blows a fuse just make sure you have the purchase
receipt handy...

All kidding aside, in my opinion trivializing the tests has many more
serious implications than the no-code debacle ever had. To make it
clear, I was and remain a no-code advocate but it was always with the
understanding that the technical testing requirements would be retained.
Now that the tests are getting flakey the whole issue of incentive
licensing becomes a joke. Let's face it, one of the complaints about

the code test was (and continues to be) that it's no real measure of anything other than personal will and determination. As long as the question pools are managed, pre-published and used in the way in which they are today, they too can be considered ritualistic and free of any meaningful measure.

There is a hidden agenda in the current tests, however, which allows those who are truly interested in electronics to actually answer the questions (gasp) without memorizing them. This serves as a sort of "proof" that real technical content does exist. I was one of those who enjoyed the technical challenge and actually learned the theory. However, I didn't have to. How hard was it? Well, my entire study for the Extra class exam consisted of thumbing through the ARRL study guide while waiting in line for the test. I'm not an EE but have been an electronic hobbyist for many years.

Today you are given a clear choice: either "just pass the test" by rote memorization, or, play along with the game and actually pass the test. Either path gets you the same license.

That excuse has been used (successfully,too) for scanners in areas they
are not permitted. I see little HAM RADIO use for an unmodified RD that
functions only in A0 mode. You can say that in court if you want but
I think you'd be lying. Do you feel that having a Ham license would
exempt you from the law? Would being a doctor allow to legally smoke
crack? Would being a bartender allow you to drink and drive?
I'll buy you dinner if that defense works.

I bought a used SB-620 Scanalyzer at the Rochester Hamfest this last weekend in hopes of using it with my SB-102. Unfortunately, the seller had it configured for a rig with a 455 kHz I.F. and the SB-102 has an I.F. frequency of 3395 kHz. I've called the Heath Company but both parts that I need are no longer available. The required parts are as follows: P/N 52-101, Bandpass Coupling Transformer and P/N 40-776, Oscillator Coil.

If anyone has built one of these units and not used the 3395 kHz parts I will be happy to purchase them from you. If anyone has a basket case unit with the required parts, that, too, would be desirable.

I can be contacted by phone (call collect) at (716) 422-3899 (days) or by fax at (716) 422-2636, by return message on this Info-hams or by mail.

PLEASE PLEASE PLEASE check to see that there is not another local repeater
15kHz on the other side of you before you try this! Otherwise, you may find
that you've traded complaints from one set of repeater users for complaints
from another set...

And yes, there are places where repeaters are spaced that closely.

>I think you'd be lying. Do you feel that having a Ham license would
^^^^^
>exempt you from the law? Would being a doctor allow to legally smoke
>crack? Would being a bartender allow you to drink and drive?

How would I be lying if I said to the Judge, "Your honor I have a license from a federal agency, the FCC, which gives me the priveledge of transmitting a signal in that band. I have been charged with having a device which indicates the presence of a signal in that band. I make a motion to dismiss the charge due to the fact that a state court does not hold jurisdiction in this matter."

And as for your drug examples, in my opinion it is more like convicting someone for murder just because they posess a gun. I can get a permit to have a gun in VA, why can't I posess a radar detector?

The problem is that my radar detector is permanently mounted in my vehicle and would take about an hour to remove and at least another hour to put it back in. Am I supposed to rip it out every time I plan to be in Va or DC in order to remain a law abiding citizen? Or should I save myself the hassle/expense and fear being caught?

Some of the resent delivered TM-741 in the Netherlands have the same problem.
I have heard that Kenwood knows this and replace the Xtal. Only there isn't
stock so you must not in a hurry.
Until the repair you clould adjust the cold and hot 70cm freq so that they
have the same offset from the nominal freq.

>reasonable at first, but that 3:1 SWR makes it possible.

No. A lossless 50-ohm "matching section" cannot possibly provide a
better match to a 50 ohm load. The SWR and return loss will be
unaffected by any length of 50-ohm cable.

Yes the MAGNITUDE of the impedance will be 86 ohms at some point on
the line (in fact, it will be 50 ohms at some point), but it will be
a highly reactive impedance that gives no better match than 150 ohms
(or 16.6 ohms) resistive (3:1 SWR).

In rec.radio.amateur.misc, fms@sw.stratus.com (Faith Senie) writes:

I wrote: [...]
>> From your posting, it sounds like you have reduced your deviation from
>> the normal 5 kHz to 2.5 kHz. One partial solution would be to tune
>> your repeater's transmit carrier 1 kHz or so below the nominal channel
>> frequency. Then you could increase your deviation to 3.5 kHz with
>> no more interference to the other machine, while keeping the entire
>> signal within the passband of your users' radios.

>PLEASE PLEASE PLEASE check to see that there is not another local repeater
>15kHz on the other side of you before you try this! Otherwise, you may find
>that you've traded complaints from one set of repeater users for complaints
>from another set...

```
-5 kHz Center +5 kHz
"Normal" center freq/deviation: |<-----------|----------->|
Reduced deviation, normal freq: |<------|------>|
Less reduced dev., lower freq: |<---------|-------->|
```

As you can see, with a lower center frequency, they can increase their
deviation with no increased interference to the higher channel, and
while still staying within the assigned channel on the low end.

>
>Today you are given a clear choice: either "just pass the test" by rote
>memorization, or, play along with the game and actually pass the test.
>Either path gets you the same license.

I agree. I suggest that there be one written exam and one CW exam. If you pass the written exam (roughly the same as the current Technician exam), you have a license identical to the current Technician class license. If you pass the CW test (5 WPM), you have the same license as today's Extra.

The ARRL could then offer certificates for those who cared to prove proficiency in a number of areas (including CW, packet, DXing, etc.)

2354. Yaesu FT-470 mods, anyone?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 22:20:19 UTC
From: uri@watson.ibm.com
Message-ID: <1992May18.222019.82990@watson.ibm.com>
Source record: 289768

Hello,
I've noticed some time ago a posting, which said among other nice things about FT-470, that there was a modification around, which allowed to turn that rig into a wild wide-band receiver (up to 1GHz, the posting said).

Can somebody please verify this, and if it's correct - what really should be done, and how wide can the reception band be? Can this rig then be used as a scanner, sort of what Icom IC-2SRA does?

[Also, why don't manufacturers brag loudly about such great capabilities of their rigs? :-]

Thanks!

Regards,
Uri. uri@watson.ibm.com

>>reasonable at first, but that 3:1 SWR makes it possible.

And Zack says:
>Sorry about that. In that case, you are just wrong.
>The 50 ohm cable doesn't improve the SWR.

>The quarter wavelength of 50 ohm cable transforms the 150
>ohms to 16.67 ohms, maintaining the 3:1 SWR, as opposed to your
>claim that it transformed it to 86.6 ohms.

Sorry Gary but Zack's right. And just to make sure that nobody gets
any wrong ideas, a small clarification. A 50 ohm transmission line
with non-unity SWR has multiple points (depending on its length) where
the resistive part of impedance is 50 ohms, but at these points there
is always a reactive component present. Assuming SWR of 3:1 this component
is either + or - j57.5 ohms (apr.) . The only two possible purely
resistive values in a line with 3:1 SWR are 16.7 and 150 ohms as mentioned.
(The reactive component can of course be "tuned out" with another
reactive component; a capacitor, inductor or stub, but here we are
talking about a simple coax line between an antenna and a tx.)

It is also impossible to get any "closer" to a perfect match with a line
of the same characteristic impedance as the source (if the line is lossless).
The concept of reflection coefficient clearly shows this. An SWR of 3:1
corresponds to a reflection coefficient (complex figure) with a length
of 0.5 and a phase angle of anything from 0 to 360 degrees depending on
where you are on the line. More intuitively: a 3:1 SWR corresponds to a
circle with radius 0.5 on Smith's chart. And as we all know, a circle is
a group of points with equal distance to the center, which in this case
represents a perfect match. (This is why the concept of SWR isn't very
good: it doesn't contain the phase information. Nevertheless it is
directly related to the length of the refl.coeff. vector.)

As Gary said earlier, the transmitter doesn't care about the SWR on the
line, but the load the line presents to it. But if the line has standing
waves, the load presented by it is always something different from what
it should be. It is true that some combinations of resistive and reactive
components corresponding to same value of SWR _may_ be better to the
transmitter but that's entirely dependend on the internal design of the

transmitter and almost impossible to predict without complex mathematical analysis. Summa summarum: You can't do anything to the situation with only a 50 ohm coax connected to a 50 ohm transmitter. The only way to deal with SWR is to get rid of it, either up at the feedpoint or, if that's impossible, down in the shack with a tuner.

What kind of capacity does a "lightning arrestor" handle. Is this
a little 'works-once-then-blows-up' device that if stuck will permanently
ground the antenna, or does it allow operation right through strikes (ie.
repeater style)?

NO, this is not the case.. The microprocessor was designed to work with many
different VFO's. It will work with a 1.2GHz module if Yaesu ever decides to
make one.. The stock radio will receive from about 120-180 MHz in the 2M band and from
400-500 MHz in the 440 band (disclaimer: It doesn't work well beyond the ham bands but it
does receive) but this is RECEIVE only.. and only with a trick
but that is available from many places.. I'd have to dig my copy up..

Hello all,

I have just joined my local RACES group here in Ontario California. I was interested in any information about what other RACES groups where doing in both self improvment and training for Emergencies as well as other type of activities that were being done. ANy suggestions for newcomers on what to do and more imprtantly what not to do.

I talking with the Person that is in charge of this program for the city. It seems that there has been little interest in the past but they are interested in new and interesting ideas. So maybe with a little help I could get a fresh start for this group and get some good experince for myself.

Any sugetions are welcome and appreciated.

No. _Your_ DJ-560 does the same thing. I can slide batteries on an off while in operation, have the DC IN power dis appear in the middle of operation, have the battery go dead while transmitting, have the battery go dead while it's receiving on my belt (and I haven't realized it) and I have _never_ had my memory disappear. :!!!!!!!!!!!!!!! I just got my ticket in the mail Saturday !!!!!!!!!!!!!!!
:!!!
:(I'm somewhat excited.)
:
:It only took 5 1/2 weeks (The 610 was mailed on 4/8/92 and the ticket arrived
:on 5/16/92). Now I get to use "KB1AAU Temporary KT" for 8 - 10 weeks until
:then N1XXX call gets here.
:

Congrats... (and I notice that the 1 district has finally exhausted the
KA1 calls).

5 1/2 to 6 weeks is consistent for a Novice license since the 610
doesn't have to go thru the second processing step at the VEC.
However, 7 to 8 weeks is the norm for Tech and higher licenses since
the mailing time and processing at the VEC takes about 10 days.

2365. MODS for Two Meter rigs and Public Service Monitoring

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-19 13:00:56 UTC
From: CELLIS%BROCKVMA.BITNET@cunyvm.cuny.edu
Message-ID: <9205191300.AA06954@ucsd.edu>
Source record: 289684

First off, I want to commend the thinking at Radio Shack to develop a responsible two-meter hand-held Amateur radio. Far more useable in many metropolitan environments than some of the other current highly publicized radios. I do understand the interest in public service monitoring, I do it myself. Here is a thought - how about Radio Shack offering a "Package" with the amateur rig - get the HT and take $50 off the SALE price of a scanner? Then hams could talk with a good handheld, the wife (or hubby) at home could listen to (and maybe get a liscense) and the wide-band receiver need would be met. Want it in the car, most scanners are portable. Everytime I drive thru downtown Rochester - definitely not a huge metropolis but big enough to have RF problems - I think about maybe I should have bought the Radio Shack HT. And I have no business or personal ties to Tandy at all. Cycle back to sentence one as the motive.

IMO, that sounds like a normal 900 MHz cordless phone. Only the
long range sounds a bit suspicious. There are nowadays several
900 MHz cordless phones, which have range from 200 to 800
meters, maybe even longer nowadays. Dunno for sure about 46/49
MHz ones, as they're illegal.. :-)

I maintain a list of mods for the 470 and will be happy to mail/post it depending on the number of requests. Here is the header so you can tell if you have a copy already.

-=-

Yaesu FT-470 MODS
Rev C (Apr 6, 1992)

This is a collection of hardware and software mods for the Yaesu 470. I have collected every mod seen on the net (ie. Usenet) since the introduction of the 470, so I think this list is fairly complete. I am interested in getting updates and corrections to this list, so please send me e-mail if you find something that needs updating. (This includes typos, wrong or missing attributions, caveats, warnings about unmentioned side effects, serial numbers of radios that won't do some of these mods, etc.)

This advice is free, so remember that you get what you pay for.

2369. Alinco DJ-580T; First Impressions (plus dry cell pack info!)

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-19 13:54:47 UTC
From: lrj@cs.cornell.edu
Message-ID: <1992May19.135447.5489@cs.cornell.edu>
Source record: 289688

NOTE: I have no connection with Alinco other than as a happy customer!

First of all, thanks to the people who sent me information and advice regarding the new Alinco DJ-580T handheld. I bought one at the Rochester Hamfest on Saturday, May 16th and absolutely love it. They're selling the radios quite quickly, at least 20 or more were sold at that hamfest, and mine has a serial number in the 5000 range. Both of the dealers who had them sold out by mid afternoon on Saturday.

The price of the radio was $375 at both of the dealers I talked with. That includes the radio, belt clip, wrist strap, 7.2v/700maH battery pack, slow charger, and antenna. I also purchased a soft case ($20), another battery pack ($44), and a noise filtered cigarette lighter plug ($17).

The DJ-580T is a compact dual band (2m/440) HT. It is about 5.5 inches high with the standard battery pack, not counting the knobs (6" high counting them). The main body is ~2.25 inches wide, going to 2.5" with the PTT bulge; depth is about 1.5 inches. If you look at Alinco's full-page advert for the radio, it is shown as actual size as best as I can tell. The included antenna is about 4.5" long; I purchased a Larsen dual-band antenna and use that instead.

The standard battery pack is 700 maH @ 7.2V. This pack uses a new connection to the radio, and seems very solid. It is a dual-rail setup, much better than the connection for the older DJ-160. Output power is listed as 2 watts maximum on each band with this pack, going to 5 watts with either an external 12V source or the higher voltage pack.

As for battery life; I'm impressed. The 700maH @ 7.2v pack had the radio monitoring a semi inactive repeater for about 12 hours or so, with my being involved in a conversation for perhaps an hour or so. I was transmitting on low power (300 mW). Thelow battery indicator actually seems to work; the radio beeps an alert and then starts flashing an indicator on the LCD panel when the battery voltage drops below ~6.2V. I had a couple more minutes of transmit before it started to really lose it.

The left side of the radio has the PTT and the FUNC keys. The PTT has a nice feel, much improved over the DJ-160. The top panel has the VHF vol/squelch knob, UHF vol/sq. knob, tuning knob, mic/speaker connectors, antenna BNC jack, and V/U speaker jack. Power on/off is on the UHF volume knob. The right side contains the DC input jack. A nice change is that tip is hot, ring is ground. On the 160 it was reversed and if you happened to touch the radio to anything in the car while powered from the DC jack, pop went a fuse. The printed advert shows the front panel with good

detail; my only comment is that the lighted keypad is nice at night, and the keys have sufficient "feel".

The mic/speaker jack on the top will accept Icom accessories. The radio seems to work fine with both my Icom HM46 speaker-mike and my Icom headset/boom mic. The V/U speaker jack is a 1/8" stereo jack; plug in a set of stereo headphones and you get VHF in your left ear and UHF in your right.

Another little thing that really impressed me was the slow-charger. I'm used to the Icom setup where you pry the rubber tab off the side of the battery and put a little jack into it. The end of the wire coming from the wall tranformer is attached to sort of a mini drop-in charger. Just set the radio (or just battery) into it and it makes a connection on the back. I like it! I haven't checked to see if there's an auto-reset circuit breaker in the pack in case you short out the two rear terminals.

I don't really have the $$$ for the quick charger ($90); however it's supposed to charge packs in 1 to 1.5 hours. It will supposedly also operate off of a 12V supply; a quick charger in your car!

Performing the out-of-band RX mod was trivial. You will need a very small phillips screwdriver, needlenose pliers, wire clippers, small heat-shrink tubing, and a clean soldering iron. With that, 'tis easy. The manual even tells you how to do the mod (!).

Once I did this and reset the radio, I could tune the following ranges:

108 - 143 (AM) 130 - 174
400 - 520 810 - 999

Now, that's what the display states. I haven't had the chance yet to see if the radio can actually hear anything on the "new" bands, although it does hear Ithaca airport on 119.60(AM) and picks up NOAA weather well on 162.40. Additionally, the second decimal point (between 100kHz and 10kHz places) is displayed in such a way that it seems like it is an indicator of the PLL not being able to lock. This only shows up on the UHF bands, and would indicate that the radio realistically has a UHF range of 400 - 484 MHz and 852 - 990 MHz. Again, I haven't had a chance to listen to anything on these bands so I don't know how deaf it is.

I had a pleasant chat with the Alinco rep. at the Alinco booth. He gave me two pieces of information which may interest others. First off, the AA dry cell packs should be available at the dealers in two to four weeks. From the glossies, they should be about the same size as the standard 7.2v pack. (go figure... :)

The other bit is that one can vary the speed of the autodialer. I didn't see this in the manual anywhere, so perhaps I'm the first to tell you all! :)

Press FUNC then FL/PL once to display FL on the LCD. Press # 1 2 3 and you'll see a single digit in the left display. Keep pressing the sequence

"# 1 2 3" to cycle through the digits; 0 being fastest, 9 being fairly slow, then A, b, C, d, (upside down A), H, and so on. Press FUNC then FL/PL to cycle back to normal mode. I find that the local repeater handles speed "C" the best; if I go faster, it seems to lose digits.

A couple of things I'd like to see changed:

(1) Too easy to reset the radio! I've accidentally done this a couple of times when trying to turn it on with only the VHF side active.

(2) Scanning speed is a bit slow; my IC-2GAT is a lot faster.

(3) What's with the dummy load that came with the radio? I put a Larsen duckie on it and it's much better. During the day, I still use the little stubbie duck, but then again I work about a quarter mile from the repeater I use during the day... :)

(4) The soft case, while nice, should have some way of covering over the TOP of the radio as well. Part of the reason I wanted the soft case is that I sometimes will need to take the thing out in the rain; the current setup allow rain to get right in and fill up the bottom of the soft case.

Yep; so far those are the only things I'd like to see changed.

I'd be happy to field any particular questions via email.

2373. Radios in a Volvo

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-19 14:43:42 UTC
From: taylor@tix.UUCP
Message-ID: <9205191347.AA02409@timeplex.com>
Source record: 289691

I don't know about the Volvo per se, but RG-58C/U cable, e.g. Belden or other reputable vendor variety is 97% shielded. Don't reject the use of RG-58 is unsuitable if it has a 97% coverage. Maybe some so-called RG-58 "type" cables have less than a full braid coverage. In all of the vehicle installations it seems that matching and standing wave problems along with coax cable routing through the vehicle are the main factors. Don't route the cable near critical items such as the computer or air bag safety system electronics. Try using an odd multiple of a 1/4 wave length of coax to the antenna (taking into account the velocity factor of the coax) to improve performance. Even a 100 % shield cable can cause problems if the vswr is high between the rig and the antenna.

Seth KC2WE.......opinions are my own and not of my employer..

2374. Antenna for a shielded 3-story building

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-19 14:48:41 UTC
From: HWells.El_Segundo@xerox.COM
Message-ID: <"19-May-92..7:47:53.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 289692

Two solutions come to mind for RF saturating three stories of a building, and I'm sure there are others as well. Anyway, here are my suggestions.

1. If it is necessary to provide communications outside the building as well as inside, then install a passive repeater into each floor. The technique is run a coax through the outside wall of the building and connect a ground plane antenna (or equivalent) on each end of the coax. The outside antenna will receive the outside signal and will transfer the signal to the inside antenna. With 100W, sufficient signal will be available for use on each floor.

2. If the need is to communicate only inside of the building, then 100 watts of power is more than adequate when distributed within. It is suggested that a coax be run between the three floors from the transmitter. A power splitter can be used to extract power from the coax to feed an antenna on each floor.

Hope this helps.

>be some truth in this argument?

IMHO, which with the addition of 50 cents might still get you a cup of coffee in some places, Virginia law is pre-empted by Federal law, but I don't know of anyone willing to take it to the Supremes to prove it. Your license gives you no special privledges with regards to owning a radar *detector*. However, they can't stop you from running a *legal* 10 GHz *amateur* collision avoidance radar system. The *receiver* for such a system might *happen* to be broad enough to pick up signals just barely outside the ham band. But it had better not say Whistler, or K40, or Cincinati Microwave on it.

The *ham* transmitter might *overload* the poorly built police radar system too. It's a pity the FCC won't enact mandatory RFI standards for consumer equipment isn't it? :-)

Be sure to *permanently* affix an approved FCC transmitter ID card to your equipment. If you're stopped, be sure to request to see the *required* FCC license attached to the police unit. Lot's of departments seem to overlook this little detail. A radar conviction can be thrown out of court if you can show that the radar evidence was gathered illegally. Also carry copies of the FCC RFI pamphlet for those poor souls who suffer interference from your *legally* operated transmitter.

Or avoid Virginia and avoid the hassle.

> anyone know of this recent allocation?

Yes, use of this allocation has been anticipated for some time. Magazines like Popular Science have been writing up the "new generation" of cordless phones that use this band. The phones have been announced by manufacturers, but not widely available, for some time now. Quality should be lots and lots better than 49 MHz, but I imagine the price will be a good bit higher.I suppose some enterprising ham will have one working on the 900 MHz ham band within a few weeks of their hitting Radio Shack.

Are we talking about the same rig? The HW-12/22/32 single band SSB rigs made in the 60s. They sell at hamfests for around $50-$75 or so, depending on condition, and whether they come with a power supply. You must be thinking about some other rig.

A wavelength at 836 is about 14 inches, so a quarterwave is around 3.5
inches. So far so good. A *5/8* wave antenna would be about 8.75 inches
long. About the length of the transportable's antenna. A *5/8* wave vertical
monopole has *gain* over a quarterwave antenna. The antennas used on cellphones
are vertical *monopoles* not *dipoles*.

>by about 9db. Am I mistaken in my theories? I'd sure like to know; that's
>why I'm posting this note amongst a world of experts.

A gain antenna may or may not be useful. The cellphone system is designed
to use minimum power so the same frequencies can be reused in another cell.
Your phone will respond to commands from the nearest cell site to *reduce*
it's output power below the 3 watt *maximum* in order to achieve minimum
signal level required by the cell site. If you are fairly close to a cell
site, your phone may put out only a milliwatt or so at the command of the
cell site. With a gain antenna, your phone may operate at much lower than
normal power levels in most cases. Now this can help battery life, *but*
the cell site may *also* reduce it's power because it assumes the path
is reciprocal. If it isn't really, and it often isn't due to multipath,
then you could be plagued by noisey *reception*.

If you normally operate on the far fringes of a cellular system's
coverage area, a gain antenna may be useful to *you*. But it will
likely cause problems for other users by hitting more than one cell.
That makes the frequency reuse part of the system fail and other users
could get crosstalk or "channel busy" indications unnecessarily.
DXing cellphone sites is not a good idea.

The 75 kHz deviation of the commercial stations sounds like wideband
noise on a 5 kHz deviation receiver. It usually won't even open the
squelch though it may look strong on the S meter. Unless Standard
put two discrminators in the HT, unlikely, you won't have much luck
receiving commercial broadcast FM with it. As far as the antenna
being mismatched, commercial FM stations run 50,000 watts while
other HT users run 5 watts. If you can hear hams and not the commercial
boys, signal strength is not your problem.

>and some random government bureaucrats, you believe the feds?????????????
>
> paul, ni1d

In this case the feds contracted with some *real* scientists to conduct
the tests. Their conclusions about *why* the system works may be in error,
but their test data does show reduction in strike frequency for the
ultra-sharp discharge systems. There's something going on that doesn't
track with Dr. Feynman's simple model. The tests were done from central
Florida where lightning is frequent. The towers were instrumented and
control towers were fitted with conventional lightning rods. At the
halfway point in the tests, the systems were exchanged from one set
of towers to the other to eliminate any chance that the location or
installation of the towers was causing the difference in strike
frequency. There's something to this system.

There is a downside demonstrated in the data however. While strikes
were much less frequent, some of the ones that did occur were lulus.
In a couple of cases the protective array was damaged. The FAA ultimately
concluded that traditional lightning rods were adequate to protect their
equipment and didn't change to the new design. Several broadcasters and
commercial two way sites have installed them however, and are pleased
with the results.

My station uses a sharp crown array above the top beacon and has experienced
no beacon damage since installation. The old blunt discharge ring didn't
adequately protect the beacon and we had to repair the beacon several times
each year. Our tower is 1040 feet and commonly takes strikes to the *sides*
of the tower down to the 600 foot level as evidenced by burn marks and
direct observation, but is now rarely struck at the top. I'm convinced
the thing works.

Well, I should have know better - when I first bought my Kenwood 440 I thought about buying the built in tuner - but I decided I'd wait until I needed it. Now I need one and Kenwood no longer makes the 440...

Does anyone in net land know where I could find the internal auto tuner for the 440? I think the kenwood model number was AT440. Please email me with leads (or even an asking price?).

>
>Sorry about that. In that case, you are just wrong.
>The 50 ohm cable doesn't improve the SWR.

That's right, it *doesn't* improve the VSWR on the cable, it
depends on the VSWR to allow it to *be* a transmission line
transformer. Walt Maxwell's Reflections explains this clearly.

>The quarter wavelength of 50 ohm cable transforms the 150
>ohms to 16.67 ohms, maintaining the 3:1 SWR, as opposed to your
>claim that it transformed it to 86.6 ohms.

I'd like to see how you come to that remarkable conclusion.
The Q section equation is Z=sqrt(Zl*Zo) where Zl is the
antenna impedance, Zo is the line impedance, and Z is the
impedance at the transmitter end of the section. That's straight
from page 16-5 of the Handbook. Now sqrt(150*50) is 86.6 ohms.

>coax to the antenna (taking into account the velocity factor of
>the coax) to improve performance. Even a 100 % shield cable can

>cause problems if the vswr is high between the rig and the antenna.

The implication, if I'm not mistaken, is that the high SWR causes more
feedline radiation. I've not been able to verify this phenomena.
However, it seems to me that if a lot of power was being radiated by
the line, it certainly wouldn't be reflected back at the transmitter.
An infinite SWR implies NO line radiation.

I'd appreciate being e-mailed any useful references...

2388. Zero Beating an FT757GX ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-19 17:54:05 UTC
From: brucec@tekgen.bv.tek.com
Message-ID: <727@tekgen.bv.tek.com>
Source record: 289703

I am not sure exactly how to zero beat this rig
to a received CW signal. The manual isn't very
clear on the subject either. If I leave both the
shift and width controls at 12 o'clock, and tune
into a CW signal (say W1AW CW Bulletins on
14.0475), it appears I have to offset the
received frequency by -800Hz (14.0467) to have the
received CW sidetone match a transmitted sidetone.

So if I now transmit, the display reads 14.0467, and
I assume that is the frequency I am transmitting on.
This situation would seem to lend itself to a classic
case of frequency walking. On each successive transmission,
two parties might tune down further on each others
signals. This situation would be cured if when I transmit,
a +800Hz shift occurs. I have heard that some rigs
do this, but I've also heard that when this happens,
the display on those rigs actually shows the upward shift during
transmissions.

If you are an FT757GX user, please enlighten me on the
proper method of zero beating.

Thanks

Bruce Cheney NI7M

In all honesty, the best way to learn about a piece of equipment and what it will do is to read the manual. When I initially requested information about this radio, one gentleman was kind enough to send me an electronic version of the manual.

Well, I just received permission from the author to place it up for public distribution. Feel free to grab the manual for the DJ-580T from helios.tn.cornell.edu (128.84.241.2) via anonymous ftp. The path to it is "pub/DJ-580T", or "pub/DJ-580T.Z" for the compressed version. The non-compressed version is ~131K, the compressed one is only about 42K.

PLEASE try to limit access to helios to times other then 9-5 EDT.

I think this is like the joke where the kid asks his dad "What's the
difference between theoretically and reality?" I suppose you could
get a lawyer and beat the case in court, but in reality, would you
want to have to do that? The alternative would be that you would have
to convince the cop not to write the ticket based on your ham license
and privileges, but that is probably unlikely, don't you think?

If you decide to test out the theory, I'm sure I'm not the only one
on the net who would like to hear the outcome!

Regards, and 73,
Dave
KZ1O

P.S. If you haven't heard the joke, the father says "OK. Go ask
your mother if she would consent to sex with a stranger for $100,000.
The kid does, and the mother says, "I guess so. Sure." He tells
his father, and then the father says "Now go ask your sister
the same question." The kid does, and gets the same response. The
kid relays this to the father. The kid says, "But what does this
have to do with the original question?" The father says "Well,
theoretically, we are sitting on 200 grand, but in reality, we
are living with a couple of whores."

Hope this didn't offend anyone..... this isn't the place
for jokes normally, but this one fit so well..... :-)

>Really interested in how exactly 20 meters works within the 52 foot top
>section. Thanks for any help!

52 feet is about .75 wavelengths on the 20 meter band and just over
a wavelength on 15. The radiation pattern should have a single lobe
at right angles to the wire. On 10 meters the wire is 1.5 waves
long, and the pattern should have two lobes somewhat off from 90
degrees. (All the antennas are, of course, bidirectional.)

I'm looking for Midland Syn-Tech VHF low-band, high split mobile radios (model 70-056). I know where I can get some for ~$300, but I've seen them for ~$100. I could probably use as many as 8. I'd also be interested in other similar (synthesized, under-dash VHF low-band radios).

Also, as always, I'm looking for low-band duplexers or cavities. The four I came across at Dayton had all been sold by 8AM on Friday. Yes, I know I could run split site instead.

Any leads will of course be greatly appreciated.

-Thanx

Forwarded for Gerry Creager, N5JXS, SAREX Project Engineer, Co-Investigator, and all-around flunky:

> I have heard some rumors that there will be some continuing SAREX
> (Shuttle Amateur Radio EXperiment)
> activity on STS-50. Does anybody have additional information about this?
> (If so, STS-50 might even get to take part in Field Day! What a summer
> this would be!... the Olympics, STS-50 takes part in Field Day, etc.)

Dick Richards, KB5SIW, and Ellen Baker, KB5SIX, will both be operating SAREX during the STS-50 (USML) mission in June and early July. Newly licensed, Dick, the Commander, and Ellen, the MS2 (Flight Engineer) will work opposite shifts, providing a large number of SAREX opportunities. Scheduled activities include 10 CONUS schools, 2 schools in South Africa and 3 in Australia. AIn addition, 5 passes have been dedicated to the Fast Scan ATV uplink experiment, where several stations operating across the country with Special Temporary Authorizations for power output will attempt to uplink FSATV pictures to the crew.

Before you think all the operating time is taken, this mission is scheduled to last 13 days, as the first of the Extended Duration Orbiter flights. I would anticipate that you can expect to hear the crew on, using one of their own calls, or possibly the station call W5RRR, almost anytime they are over a landmass. Orbiter activities permitting, of course.

In addition to routine voice operations and FSTV ops, this SAREX configuration will carry Slow Scan TV (ROBOT 1200C) and standard 2m packet capabilities. As with STS-35, the Packet Robot will be operating during the times when no other activities are occuring. It should be noted that SSTV and Packet ops are mutually exclusive in this hardware design.

General QSO operations will occur at the crew's discretion, and without any necessary prior coordiunation with the ground. My suggestion is that you get some tracking software (AMSAT Software Exchange is a good source, and AMSAT helps fund SAREX with your donations...) or get some help from someone with the software, and simply listen when the Orbiter is over the CONUS.

General voice QSO frequencies will be:
Downlink: 145.55 MHz
Uplink: 144.91, 144.95, 144.97 MHz (the crew will select one of the uplink frequencies at random and NOT announce it)

Packet Downlink: 145.55 MHz
Uplink: 144.95 MHz

Sorry, but without my frequency list, I cannot give the General QSO frequencies for Europe right now... More to come on that.

[Gerry tells me that the European frequencies are the same as for STS-47...K5ZC]

Please noe folks: The frequencies are offset, so DO NOT TRANSMIT on the DOWNLINK! Also, please note that if you hear SAREX activities on other frequencies, that those are scheduled activities and should NOT BE used to call the Orbiter. We did have a few problems last time with folks calling on school or JSC SAREX Control frequencies trying to get contacts when other activities were going on...

One more thing: Please let the Johnson Space Center ARC have a little time with the crew if we get called. That is frequently the only way, and the only time, the crew can ask some purely Ham-Radio questions, and if we cannot make contact with 'em due to excessive QRM, we might not be able to schedule that extra pass over the US where they want to talk to YOU specifically.

Hope that gives you the info you needed. Ship other questions to me directly at gcreager@gothamcity.jsc.nasa.gov and I'll try to answer them for you.

> thanks.

Glad to...

-- MONTHLY REVIEW OF SOLAR TERRESTRIAL ACTIVITY --

Summary for April 1992 and Six-Month
Solar Cycle Outlook

Data Provided In-Part by the
Space Environment Services Center, NOAA

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK MAY 1992 - NOV 1992

We are now in month 68 of solar cycle 22. Activity levels were low again, with a total of eight energetic events this month compared to four last month. Like last month, only one of these reached major flare classification. Sunspot number and 10.7 cm solar flux continued to fall, leading many veteran solar cycle observers to suggest that this may mark the beginning of the first steep decline from the plateau of high values which have held since the beginning of 1989.

The eight energetic events recorded this month originated from four different regions. The largest and only major flare of the month, an M5/SF at 01/0100 UT was from Region 7116 (S08,L=337). This flare was accompanied by significant radio bursts across the spectrum, including a 240 sfu Tenflare. Region 7116 also produced an M3/1B later on 01 April at 1748 UT. An uncorrelated M2 was sandwiched between these flares at 1017 UT. Region 7135 (S16,L=005) produced two M1's, one on 17 April, and the other on 20 April. The final three flares of the month were all M1's; an M1/2B from Region 7139 (S16,L=341) at 22/0120 UT, and two M1/1B's from Region 7138 (N09,L=343) at 24/1253 UT and 1920 UT. An eruptive prominence near S19E90 with material visible to .17 solar radii was recorded at 07/1732 UT.

There were no proton enhancements or events recorded this month.

Geomagnetic activity was similar to March, ranging from quiet to active. There were no storm days and only three days of active conditions at mid-latitudes. The activity of 06-08 April is thought to be in response to a disappearing filament and eruptive prominence from the west limb on 04 April. A small sudden impulse (12 nanotesla) was recorded at Boulder at 14/2025 UT, but had little effect on the daily indices.

Indications from the past several month's 10.7 cm flux and sunspot number values suggest we've taken our first major decline after solar cycle 22 maximum. Statistical models and previous cycle patterns suggest activity will plateau at this new lower level before plunging again in several months.

2401. AM antenna question

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-19 20:02:31 UTC
From: jsantos@godzilla.ma30.bull.com
Message-ID: <jsantos.706305751@godzilla>
Source record: 289718
Cross-posted to: rec.ham-radio,rec.radio.amateur.misc,rec.radio.cb

Hi,

I am not really an amateur radio enthusiast, but I thought
that this might be a good place to ask this question. I was wondering
if there was anything that I could do to improve the reception of a
standard AM radio. Since these radios typically do not have any
connections for an external antenna, I am sort of at a loss regarding
how to apporach this. I seem to remember seeing something a long time
ago about being able to build an antenna that can somehow can be
inductively coupled to the radio rather than directly connected, but
this could be a figment of my imagination :-) Any help that you could
give me would be greatly appreciated.

Thanks

^^^

Given that the 900 Mhz allocation is shared with the ham 902-928 Mhz
band, you're quite right. All the enterprisign ham need do is turn the
phone on.

2403. Which USN station is NCP?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-19 21:19:29 UTC
From: dwilson@s850.mwc.EDU
Message-ID: <9205201119.AA25037@ucsd.edu>
Source record: 289644

I do not understand why no one checked the ITU lists instead of guessing. NCP is the USN station at Subic Bay.

However, as someone reported NGT stands for NASA Ground Terminal, perhaps NCP is also not an actual callsign but rather maybe something like NASA Command Post or similar. In fact, I consider this more likely.

From: darnold@felix.filenet.com
Message-ID: <17891@fritz.filenet.com>
Source record: 289723

Greetings,

I was looking for a 465B or 453 used, but all I found so far was a used HP 1740A used. I know the Tek scopes have a great reputation, but I don't know anything about the HP's.

How would you rate the HP1740A against the Tek 465B in terms of performance, reliability and features. What would a fair price be for a used 1740A in excellent condition?

I will be using the scope for hobby work (amateur radio,audio,video, kits,etc).

Thanks in advance.

Hiya. I passed my test for the Technician class liscence a few days
ago. I bought an Alinco DJ-580T too. Here's what I'd like to know:
If I buy a dual-band antenna mast which has threads on the bottom of
the mast which match those of my glass-mount Cellular phone antenna,
could I replace the cellular antenna with a dual band 2m/70cm antenna,
using the cellular glass-mount base? (Did anyone understand that?)

>impedance at the transmitter end of the section. That's straight
>from page 16-5 of the Handbook. Now sqrt(150*50) is 86.6 ohms.

But 86.6 ohms is "the characteristic impedance of the matching section"
If you had a quarter wavelength of 86.6 ohm cable you would match
the 150 ohms to 50 ohms.

Figuring out what impedance come out of a quarter wave transformer is
merely a matter of rearranging the equation.

Zo (out of matching section)= (Z impedance of matching section)^2

Zl (into matching section)

so, figuring out (50 ohms)^2/(150 ohms), I get approximately 16.67
ohms. Of course, this also works with impedances with reactive
components, but the math gets a little more messy. An interesting
exercise is to figure out what length of 50 ohm cable IS needed to
get from an impedance of 150 ohms down to 86.6 ohms. Its NOT a
quarter wavelength.

>from page 16-5 of the Handbook. Now sqrt(150*50) is 86.6 ohms.

Directly quoted from the ARRL Handbook, 64th edition (1987), page
16-4: "If the antenna impedance and the characteristic impedance
of a line to be matched are known, the characteristic impedance of
a matching section is Z = sqrt(Z1*Z0), where Z1 = antenna impedance
and Z0 = characteristic impedance of the line to which it is to be
matched."

Ie. a quarter wave section of 50 ohm coaxial cable (Z=50ohm) will
transform an antenna impedance of 150 ohms (Z1=150ohm) to 16.7 ohms
(Z0=16.7ohm). Z0 = (Z^2)/Z1 (=16.7ohms in this case).

I'd advice Gary to get familiar with the use of the Smith's chart.
That's the easiest way to get a picture about what really is
happening in a transmission line.

I have a Tropez 900 Digital-- It appears to be a spread-spectrum, Part 15 device offshoot of the relatively new Local Area Network Wireless technology. Inside is surprizingly little hardware. The R.F. and synthesizer stuff is under tin, maybe two or three square inches by one-half high. There's a separate "p.a." board-- a little thing, with some unimpressive matching twists of inductance. I think these things are allowed two watts total input. With the help of some aluminum foil (one wavelength or so) jammed into a plastic straw, stuck on top of the 1/4 wave whip out of the base unit, my phone gets about two blocks through or around some formidable buildings. I am convinced that when I test it out on top of a 400+' building I will easily get a mile or better. I am using a claimed 35 milliwatt FM video 900 Mhz part 15 relay transmitter on the same tall building and have no problem with snow-free ("5") reception quality at about two miles-- no telling what the range would be with a 19.5 db antenna, instead of a 9 db. The video unit is by Wireless Technology of I think Las Vegas, Nevada.
If you try to monitor the Tropez, all you get is a bit of hiss. There is very little pattern to the sound and detection would seem hopeless without control of the S.S. technology. The 900 Mhz band is going to be very very crowded in urban areas. Pity those who are buying the car theft locators by Pactel (Teletrac) and perhaps lojack? Now is a good time to try to reclaim the frequencies for amateur use; the FCC says we are subordinate to commercial activities now infecting the lower 900's.

Hi ... My 30 foot Chieftan sports a 32" 3 bike rack off the back bumper. As such, I have an ideal mounting for mobile antennas. Procomm showed rust a day after it was on the rig and has since been replaced by Hustler. I use two mirror mounts off a bolt on the rack to support the stud. A six foot piece of aluminum rod is terminated into a four band extender. 80 meters (for packet) goes straight up with 15, 20 and 40 out the sides. On the other side is a like setup with a ten meter whip. In the roof Larsen quarter-waves are used for 2, 220 and 440. At the campground I use a five band Hustler full size vertical mounted on a ten foot mast. A ground strap to the roof provides a nice radial. This set up has, for the most part, kept me in touch with the home PBBS for 64 days of camping last year. Future plans include the adding of a 3 element 2 meter and 8 element 220 beam to assist in local networking. I carry a MSYS PBBS using one port on HF and one on whatever VHF or UHF band is appropriate. Current work is in learning and optomizing AMTOR as a means of getting home using the new MSYS AMTOR port facilities. 73, Steve, NO8M @ NO8M.OH.USA.NA

OK, that one i'm quite familiar with. NGT is the NASA Ground Terminal
in White Sands, NM. This is the hub of the TDRS network. The Ku-band
signals from the Shuttle are relayed back to NGT on the C-band TDRS
downlink, then they turn it around and uplink it on Satcom F2, channel 5
for Houston and the rest of NASA to see. JSC takes that feed and uplinks
it yet again on NASA Select... That's quite a few hops, but it sure does
make for some pretty pictures! <heh>

Well, I've decided that the duck which comes with the new Alinco 580 is
better suited as a dummy-load. Can anyone tell me a good dual-band antenna
which isn't too obtrusive?

The media in Australia reported that a tracking station outside of Perth
was participating in the operation. This agrees with the eastern Indian Ocean
placement, and the P in NCP could well be... mere speculation on my part,
however

cheers

>home. I will post them soon as I can. BTW, when is the show? I wanna go too!

The airshow season starts this Friday and Saturday, with the annual Open House and airshow on the Andrews Air Force Base flightline, in Camp Springs, MD.

According to the early information, the gates open at 9AM on both Friday and Saturday...the open house lasts until 5PM both days. The show is supposed to open with the Army Golden Knights parachute team, dropping in with the American flag and, typically, an MIA flag as well.

Aerial demonstrations (fly-bys) each day will include:
Air Force F16
Air Force B1
Air Force B52
Navy F14 "Tomcat"
Marine Corps AV8B "Harrier"
Coast Guard HH65 helo.

Ground displays include:
Army drill team
Military Police working dogs
Andrews America Parachute team
Air Force Honor Guard.

Each year the flightline is always crowded with static displays of all kinds of aircraft, from helos to jets to props to last year's F117A Stealth Fighter.

There will also be a mass (as in 500 of 'em) parachute drop, and (finally) a balloon race on both Friday and Saturday.

Flightline regulations are NO BALLOONS
NO SMOKING
NO PETS
NO GRILLS, but THEY DON'T PROHIBIT SCANNERS!!!
Try these on for size:

>Was it being used as a shuttle-to-Houston relay station?

I heard the same thing and believe I know at least a partial
explanation. The astronauts suites communicate with the shuttle
via UHF AM voice frequencies (259.7, 296.8 and 276.1(?)). The audio
from the UHF-AM receivers on the shuttle gets fed into the S-band TDRS uplink
A/G audio (a digital bit stream) and shows up on the ground A/G audio
when they are configured for eva (this is how the spacewalking astronauts
talk to Houston capcoms). And what shows up on the A/G audio usually gets
put out on NASA select (and did in this case).

What was happening is that random ground UHF signals were
getting picked up by the shuttle receivers on one or more of the suit
frequencies when they were over the ground transmitters. One of these,
which seemed to be located in the eastern Pacific or even some part of
South America transmitted a 600 or 1000 hz tone with periodic CW ID's
(technically MCW ID's) of NCP. It seemed as if the tone was transmitted
continuously for about 15 seconds and then the ID and then more tone.
This reminds me of the CW ID's used in VOR, TACAN and
glideslope/localizer/marker navaids, but of course these do not operate
on the shuttle frequencies.

I do not know the nature, purpose or origin of the "NCP" signal,
but believe it to be a UHF transmission on one of the shuttle
frequencies. I would be curious if anybody does know what it was - whatever
it was it sounded pretty powerful. And yes, NCP would probably be a
US navy call.

The problem was aggravated in the third eva by the fact that they
used half duplex vox operated transmissions and the shuttle receivers were
looking at no signal for most silent periods and were therefore wide open
to ground signals. And they also were using all three rf frequencies
in that configuration I believe.

I also noticed that when they were over the horizon to Rio in Brazil (coastal Brazil) they were picking up a FDM-SSB voice signal with some quite obvious SSB inverted and frequency shifted speech and data signals. I was too interested in what was going on in the rescue to bother to tape the audio and try to recover the SSB voice (inverted) to see what language it was and maybe something about who was sending it. One could hear a quite evident doppler shift in the signal as they flew over. A real puzzle to me was what was supplying the carrier "bfo" to mix with this signal - my best guess is that this was received on one of the links with a continuous carrier which mixed with the signal or perhaps that they use phase locking synchronous AM detectors (but then why the doppler shift?). The signal was probably a UHF-PM-FDM-SSB multi channel line of site telephone link used by the Brazilian military or someone in the Amazon area. The astronauts seemed to know about this problem - and sounded like they expected it - so apparently NASA has not been able to get the thing moved to another frequency.

A different example of RFI occurred when they were trying to get video via the S band FM system through MILA (Merrit Island tracking station near KSC) during the rendevouz phases when the Ku antenna was being used for radar and no TDRS video was possible. The video they received very definately suffered from slight to quite severe interference from another video transmission of what looked like some broadcast TV signal with a completely unrelated picture. This faded in and out and sometimes seemed overwhelming. I know that at one point they were trying out the helmet mounted cameras - it is remotely possible that this was coming in on the rf link for that (I do not know the frequency or mode of this) but I sort of remember seeing it on one of the payload bay cameras too.

The problem did not seem to be related to the link from MILA to to JSC Houston, which was being sent via F2R/Tr5 - the color bars they sent before and after the pass were just fine with no interference at all and there seemed to be nobody else on the transponder when they keyed up the feed from MILA.

I believe the S band FM-TV downlink from the shuttle is on something like 2182.5 mhz which is in a band allocated to the military which shouldn't get interference from the ground near MILA, so the whole thing is puzzling.

I wondered if the MILA signal was being relayed on another transponder other than F2R/tr5 (maybe ku?) and what I was watching on TR-5 was just a retransmission of it but that seems unlikely since TR5 is used as the primary relay of TV back to Houston from what I believe to be the White Sands TDRS ground station (NGT-TV). They definately dropped carrier on TR-5 and came up with a MILA-TV chyron slate before the passes with the interfernce problems, dropped carrier again and came back with NGT-TV again afterward with no traces of any problem during any of the switches so it seems unlikely to have been introduced in the video relay process.

Perhaps somebody knows an explantion for this one too...

2422. How do I get the case off my Alinco 580T?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-20 06:46:23 UTC
From: rosso@mythinc.uucp
Message-ID: <1992May20.064623.508@mythinc.uucp>
Source record: 289586

I recently purchased an Alinco DJ-580T, and would like to perform
the modifications to receive aircraft frequencies. But I can't
get the case open! Has anyone else encountered this problem?
I take off the knobs, remove the four screws from the bottom and
the three from the back, but the two halves will not come apart.
The joint along the top seems to be stuck. Is it glued or fused
somehow? I'm assuming the front half of the case slides up and
over the knob shafts.

Thanks,
Ross Oliver

>SWR is to get rid of it, either up at the feedpoint or, if that's
>impossible, down in the shack with a tuner.

Tomi makes good points. After mulling over the Smith Chart for an afternoon, it came to me that using simple formulas can be misleading. Without a stub, or a lumped reactance, there's no way to get a better match with 50 ohm cable. If the reactance can be absorbed into the tuning network of the transmitter, or into the *antenna* load, then improved resistive impedance matching is possible. But barring that, the situation doesn't improve with different cable lengths.

I'm afraid I got sidetracked into the old SWR arguments and neglected to touch on the complex parts of the impedance. SWR on a cable is *necessary* in order for it to act as a transformer of the real or imaginary parts of impedance, but both parts of the impedance change *together* and you can't ignore one while optimizing the other. Transmitters and antennas don't care about SWR, but they may care very much about the complex impedance present at their terminals.

Now that said, back to the G5RV. It seems that the flattop is *non-resonant* on every amateur band. That means that it's terminals will always present some value of *reactance*. If cable lengths are chosen appropriately, that reactance can be made to cancel the reactance of the lime acting as impedance transformer. Thus our 50 ohm line *can* be made to do matching as part of the *system* of antenna, ribbon line, coax, and transmitter.

Source record: 289642

In article <1992May19.154151.6637@ke4zv.uucp> gary@ke4zv.uucp (Gary Coffman) writes:

monopole has *gain* over a quarterwave antenna. The antennas used on cellphones
are vertical *monopoles* not *dipoles*.

Some manufacturers also make halfwave antennas for transportable and
handheld equipment. The advantage of these antennas is that they do
not need a ground plane and therefore their performance is not affected
by differences in the ground plane (which is actually the phone body
and the user's hand).

I also understand that some elevated-feed mobile cellphone antennas are
based on coaxial dipole-type construction.

Otherwise I agree with Gary.

BTW. I wonder where the original poster did get his information. I have
yet to see a -6dB cellphone antenna. On 2m and 70 cm yes (most rubber loads
are even worse) but on 800 MHz (or 900 MHz here in Europe) even the
shortest stubs in portable phones are at least quarterwave.

In article <37i2kB1w164w@dreaml.wariat.org> jga@dreaml.wariat.org (Jon Anhold) writes:

Hiya. I passed my test for the Technician class liscence a few days
ago. I bought an Alinco DJ-580T too. Here's what I'd like to know:
If I buy a dual-band antenna mast which has threads on the bottom of
the mast which match those of my glass-mount Cellular phone antenna,
could I replace the cellular antenna with a dual band 2m/70cm antenna,
using the cellular glass-mount base? (Did anyone understand that?)

The answer is no for two reasons:

Glass-mounts are matched to the maximum performance on the operating band.
Cellular mounts work well on the 800 MHz bands, you have to buy separate
mounts for 144 and 440 MHz bands. I have yet to see a 2m/70cm glass-mount
antenna, I suppose the dual-band base is very hard to design.

Glass-mount antennas are usually halfwave (or collinear wit a halfwave
bottom section) since there is no ground plane available. Normal 2m/70cm
antennas do need a ground plane and do not work when installed on a
glass-mount (even if the mount was designed for 2m/70cm).

Someone inquired (in private mail) about where to get these ridiculously cheeeeeep (29.95 brand new) hand helds that do packet (and voice for that matter -- on FM!), but our outgoing electronic mail service has been fried for over a week now, and the last 174 messages I sent out have all been (beeep!) returned (beeep!) to (beeep!) me. Cussed bells, anyway...

So - to answer the burning question -- run down to your friendly Shady O Rack and plunk down your plastic money or -- gee -- even green cash if you're so inclined and buy TWO, not one of them. They work great.

Our laboratory-fix-anything-that-Luck-Hurder-can-bust guru, Ed Hare, just got the crystals in yesterday to sneak them up a smidgen to 6 meters. But they worked just fine before -- and completely unlicensed would-be hams can easily use them to get gatewayed into the international amateur radio packet system -- if that's what your local groups of amateurs wanna do in the way of attracting newcomers to the wunnerful world of "digital"... Think about it.

Here in the Hartford area, I've been raising money to get TNCs (and these el-cheepo HTs, of course) for handicapped folks who could not only benefit from the enjoyment of Amateur Radio, but who are also typically quite fond of particpating in digital traffic nets, and are most often quite capable public service communicators, once licensed.

The Radio Shack $29.95 rigs are a neat way to introduce them to public service communications, and besides, I've been having a ball doing it.

You'll see all the gory details in Q-Street later this year, no doubt.

2429. Re: MODS NEEDED FOR RADIO SHACK HXT-202

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-20 14:06:00 UTC
From: rpo@trsvax.tandy.com
Message-ID: <1787700002@trsvax>
Source record: 289589

Actually, I did not have a real problem with the original
post. I thought it was clever and funny, and clearly
identified as an 'April Fools!' posting. In addition,
many/most of the components referred to don't exist,
and the Service Manual that was referred to was still
at Proof stage, on my desk (not even possible that
someone might have had a mass printed copy).

However, whoever edited the posting and replayed it on
packet without the 'April Fools' disclaimer was
irresponsible and I was NOT amused. In addition to having
to handle many calls from customers, we had to include
an article in our store publication 'Merchandising Newsletter'
to advise the stores of the false story.

Folks, we intentionally designed the entire radio to be as
immune to intermod as is possible with an HT. To do this, we
had to make the front end closed to anything but 2-meter.
Most HT makers use a common front end for 2-meter, aviation,
business, police, etc...and they just filter the unwanted
stuff out on down the line. While this might be more economical
for the manufacturer, in high intermod areas, this just don't work.
I like the advice I've been hearing -- 'If you want a scanner,
buy a scanner!'

>"klixon" would open and the series resistance would present a much reduced
>charge current to the charger. The charger would then need to be able to sense
>the much reduced charge current (eg thru the resistor) and latch itself into
>a trickle charge mode. Is this what they do?

John DeArmond corrected my original posting about a "thermistor" in the pack. What's actually in there is a *thermostat*. The charger senses the open circuit and latches back into a trickle charge mode that engages when the pack cools back down. If you pull the pack out of the charger and reinsert it, the switches in the bottom of the charger that sense battery type start the quick charge cycle over. As soon as the battery heats, quick with a fully charged battery, the charger trips back to trickle.

Sorry for the initial misinformation.

Source record: 289650

Does anyone have any mods for any of the following scanners?

1) PRO-2023 (20 channel from Radio Shack, made by Uniden)
2) Bearcat 200XLT (I've already done the cellular restore mod, but far be it from me to illegally listen to cell phones ;)
3) Bearcat 145XLT (16 channel, no search mode or frequency display)

And while I'm here, has anyone used the ICOM R-100, R-1, IC-2SRA or any other wideband scanning receiver/transceiver? How fast do these things scan? I've seen a couple of the dual band HTs in scanning mode and they seem relatively slow (< 10 channels/second). Are the wide band units made by ICOM and others any better at image rejection than the Uniden scanners?

Thanks in advance for any info! I'm at DMH.WBST129:XEROX.COM

Aloha,
Dave.

>to trickle (maintenance) charge quite accurately.

This is sometimes called minus-delta-V charge termination. You look
for a drop in terminal voltage of 10 mV or so, and then switch to
trickle charge.

Apparently the effect is due to the fact that when the pack reaches full
charge, it starts to heat up at a considerable rate, since the incoming
energy is all turning into heat instead of chemical energy. The rise
in temperature causes a drop in the pack's terminal voltage, and this
is what the charger circuitry measures. The neat thing is that it
senses a *relative* drop in voltage, which corresponds to a relative
rise in temperature, regardless of the absolute temperature the
pack started out at. A thermostat in the pack would switch at some
particular absolute temperature, and if it is set high enough to be
able to charge a pack in the desert, it's set too high to stop the
charge at the very beginning of overcharge.

Source record: 289664
Cross-posted to: misc.consumers,rec.radio.amateur.misc,rec.radio.shortwave

Where can I get a clock with these features?

1) 24-hour display, e.g. 13:14:15 rather than 1:14:15 PM.
2) Digits at least 25mm high, preferably around 50mm.
3) Lighted, e.g. LED or fluorescent display.
4) Electronic, not mechanical.
5) Not from Radio Shack.
6) Display of seconds desired, but just hours and minutes acceptable.

As usual, please send email directly to me; I'll post a summary
if response warrants.

>
>How would you rate the HP1740A against the Tek 465B in terms of
>performance, reliability and features. What would a fair price be
>for a used 1740A in excellent condition?

Dave,

I've got a 1740A and am quite pleased with it. It is very stable and
has a nice display. I've never owned a 465 but from what I gather they
are somewhat smaller in physical size.

The inside of the 1740A is a masterpiece, well built every inch of the
way.

I picked mine up at an auction for $265, which went at a low price
because it had previously been rack-mounted and had no handle or accessory
bag. Expect to pay between $500 and $700 for a typical used one. I wouldn't
hesitate to buy another if I needed it.

2439. followup on Ramsey Electronics...

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-20 15:40:25 UTC
From: btbg1194@uxa.cso.uiuc.edu
Message-ID: <1992May20.154025.10139@news.cso.uiuc.edu>
Source record: 289657
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

Just a followup on my posting about Ramsey Electronics:

1) I have gotten no positive reports about Ramsey kits. In fact,
there was only *one* response to my original posting, and it was also negative
and from a guy who had bought one of Ramsey's VHF transceiver kits.

2) In hindsight, the Ramsey kits are ridiculously overpriced for what
you get in the way of the quality of the circuit design and the documentation.
For example, the VHF transceiver kits run $180 to $190 for a *kit* which you
have to assemble, debug and which have only 10 diode-programmable frequencies,
compared to $230 or so for an Alinco "data radio" which is assembled and has
synthesized tuning. (don't let anybody tell you that it "costs" more to put out
a kit... think about it.)

3) The Ramsey packet modem kit cost me $70 on a Dayton "special".
It is basically a Baycom circuit with little documentation other than assembly
instructions. You can get Baycom "kits" for $40, and the Baycom documentation
goes much farther to explain to you how to get on the air.

4) And whatever you do, don't *assemble* your Ramsey kit. They
won't give you a refund in that case. :-) (although I haven't given up yet!)

I wish that somebody had warned *me* about Ramsey before I plunked down my
$70. sigh.

One other tiny correction you might want to make: unless the formulas
were developed for an alternate universe, "pi" should be approximated
as 3.1416 to four places, not 3.1415 :-).

> Brian Beezley, K6STI, has written a compiled BASIC program
>that calculates the inductance values.

For those who would find a PC compiled BASIC program useless even as
a doorstop, I have written a C implementation (which I ought to clean
up before sending it out, since I wrote it at 11pm last night... :-).
It, like the BASIC program, gets slightly different numbers, so I will
also try to confirm that it really is just roundoff error before inflicting
it on anyone.

Send me mail at "jfw@funhouse.com" if anyone is interested.

actually a thermostat set for a fixed temperature works out to be a very good solution. A hot nicad pack will not accept a charge anyway. Nicads in the desert are just about worthless for this reason. Nicads are great when they are cold but lousy when they are hot; lead acid cells are just the opposite, great when hot, but lousy when cold.

A number of years ago around the end of WWII (or was it Korea?) legend has it that there were tons of surplus Nicads (liquid) available. An enterprising company decided to capitalize on this resource and offer them in the form of lifetime car battery replacements. Everything went fine until the first time one of their customers tried to start his car on a hot summer day...

Hmmm..., I'm confused. NiCad batteries are very common in aircraft;
some helicopters and fixed wing aircraft use them exclusively for starting
and general electrical loads. It gets very, very hot in an aircraft
parked in the sun. What gives?

[... stuff about expensive Ramsey kits ...]

>synthesized tuning. (don't let anybody tell you that it "costs" more to put out
>a kit... think about it.)

It often costs more to "make" kits than assembled products. There was a long thread about this a few months back on 'sci.electronics' about the demise of Heathkit. The two biggies that make kits expensive are volume and complexity.

Production of assembled components in high volumes is surprisingly cheap. Kit companies never seem to get the volume they need. Supposedly, at the very end Heath was still hand-stuffing components into little baggies.

Kits often can't be as complex as assembled products. Look inside your HT and think about hand assembling it. Kit builders usually don't have the test equipment that the production line and service tech have. Finally, kits are designed to be built and *work*, usually at the expense of performance.

It is getting to the point where food is the only thing you can save on by making yourself.

Does anyone know what the new Icom radio is that is shown under the cover in the ads? Was it at Dayton?

I have one such from Radio Shack, and it works just great. What's the problem? I'm no great fan of RS either, but... credit where credit is due, eh?

>repeater style)?

I believe lightning arrestors do wear out after a number of strikes.
The Alpha Delta brand includes replacable cartridges for this reason.

As to whether the radio will survive -- it depends on the radio.
The lightning arrestor clamps the voltage spike at a few hundred volts.
If the radio will survive that, then you're OK.

Actually the coax cable itself acts as a kind of crude lightning arrestor.
It will flash over at a few thousand volts. Of course this only works
once!

A very important point: The lightning arrestor only limits the voltage
difference between the shield and center conductor of the coax. It
does nothing to limit the common-mode voltage & current on the shield.
To protect against this, you need a very short, fat ground connection
to earth at the point where the coax enters the building. Most
lightning arrestors have a ground connector for this purpose.

Message-ID: <1992May20.191254.27245@dvorak.amd.com>
Source record: 289677

Ok, Ok! My mailbox overfloweth! Here is my collection of mods for
the FT-470. I've mailed around 30 copies of this already -- thanks
for all the interest.

Brian

-+-

Yaesu FT-470 MODS
Rev C (Apr 6, 1992)

This is a collection of hardware and software mods for the Yaesu 470.
I have collected every mod seen on the net (ie. Usenet) since the
introduction of the 470, so I think this list is fairly complete. I
am interested in getting updates and corrections to this list, so
please send me e-mail if you find something that needs updating.
(This includes typos, wrong or missing attributions, caveats, warnings
about unmentioned side effects, serial numbers of radios that won't do
some of these mods, etc.)

This advice is free, so remember that you get what you pay for.

Brian McMinn (brian@nucleus.amd.com)
N5PSS

-=-

Full Reset:

Effect: Severe! :-)

1) Make hard (paper) copy of all memory info
2) Turn radio off
3) Hold down VFO and MR and turn radio on
4) Replace all memory contents

Notes: This will reset the auto repeater offset function, so
you will need to re-enable it if you use it. This will also
disable (mask) all memories except #1, so you will have to
enable each of them by hand.

Attributed: Yaesu

-=-

MARS Mod:

Effect: Enable extended 2m receive, 2m transmit

1) Make hard (paper) copy of all memory info
2) Turn radio off
3) Hold down up-arrow and down-arrow and turn radio on
4) Replace all memory contents

Notes: This mod wipes all memory contents. This is a "toggle" mod in that it can be un-done by repeating the above steps. The normal->MARS mod only wipes the memories. The MARS-> normal mod not only wipes the memories, it appears to do a complete controller reset (see above).

Result: Receive range 130-180 MHz, transmit 140-151MHz (I think, I haven't tried it.)

Attributed: Yaesu

-=-

Crossband Repeat:

Effect: Enable crossband repeat

1) Dial up two frequencies you want to crosslink (be sure to pay attention to transmit offsets, if any)
2) Turn radio off.
3) Hold down the RPT key and turn radio on

Result: The tone encode/decode flags and the -+ flags will be flashing and the radio will be in low power mode. When either band's squelch opens, the other band is moved into the primary frequency display and the transmitter keys. Audio link appears to be speaker to mike.

Attributed: Collier Chun (NM7B @ WA7ARI)

-=-

Crossband Repeat Audio Cable:

Effect: Provide better audio for crossband repeat.

1) Parts:
a) mini plug
b) 100K ohm resistor
c) sub-mini plug
2) Assemble cable with resistor connecting the tips of the two plugs. The shield (ground) is not connected.
3) Plug it between the earphone jack and the mike jack.

Result: Very good crossband audio. The level is controllable with the volume control.

Bugs: You can't listen to what is being repeated.

Attributed: Keith McQueen (N7HMF @ NV7V.UT.USA.NA)

-=-

Clone Mode:

Effect: Allow editing of transmit and receive frequencies.

1) Turn radio off.
2) Hold down F key and turn radio on.

Result: All segments of display are turned on. The radio will send data out the microphone tip when up-arrow is pressed. The radio will receive data when the down-arrow is pressed.

Bugs: I have yet to hear of someone who has done this successfully. Please tell me if you know how it works!

Attributed: szarekw@LONEX.RADC.AF.MIL (William J. Szarek)

-=-

Internal Jumper Mods:

Effect: Change radio from US to European to ???

I have located a total of eight straps, four to the left of the lithium battery, and four others under the flat white cable that interconnects the upper half with the lower half.

Yeasu FT-470 Straps

R69 Vertical, at the 10 o'clock position by the lithium cell
R68 Horizontal, to the lower left of R69
R67 Horizontal, just below R68
R66 Horizontal, just below R67

R71 Vertical, the leftmost of three, to the left of the upper corner of the ribbon cable connector.
R70 Vertical, the center of three of which R71 is the leftmost
R72 Vertical, the rightmost of the three
R74 Vertical, to the left of the ribbon cable connector, below the three. (Note that R74 is below an unpopulated capacitor that does not have a C number.

There is no R73, or at least it is not on the circuit board and it is not in the schematic. And, yes, the order of those three is indeed R71, R70, R72, left-to-right.

UHF CHOICES

R71 R70 R72 Rx and Tx Rx only
----
0 0 0 430 to 440 430 to 500

---

* This is the normal US configuration after MARS mod.
** This is the normal European configuration.

(Note: the receive only ranges are enabled by powering up the unit with the up and down arrow buttons depressed...kjm)

When there is more than one combination which has the same frequency range, the difference is the default step size and/or the default repeater offset. Of course, choices that do not match the VCO and filters do not actually transmit or receive on those frequencies. A particularly strange example is that the VHF side of the set can be set to tune from 404 to 444 MHz, but again, it won't actually lock. Even in the 101-141 mode, the VHF VCO will not lock - this must be for use with some other sort of VCO (It looks like this would cover the aeronautical band rather nicely.) There are two really wierd VHF settings, those for 8AL-242 and 1R3-158L. These must be for use with some other LCD controller - it displays truly unusual and non sequential thins when stepped through the "bands".

R74 seems to have something to do with selecting the IF frequency, or something similar. When set, it really screws up the VHF reception.

My technique for determining these straps is to remove the straps that come in the unit, solder wires to each pad, run the wires out of the unit to a bank of DIP switches, screw the unit back together, and then go through all of the DIP switch combinations. I usually use a stereo microscope and 30 guage wire for this. Since I didn't try powering the unit on with every combination of keys held down for each DIP switch combination, there may still be other secrets possible.

I was looking for something like receive and transmit from zero to infinity, but I didn't find it. I determined, from studying the schematic, that there should be a hiddem strapping diode from CPU pin 2 to CPU pin 22. I installed one, but nothing changed. In fact, changing it and powering the unit up did not cause a reset. Therefore, I concluded that this really wasn't a mystery strap, afterall. However, there could be others. I'm trying to get a data sheet for the CPU, from Hitachi, to see if any of the grounded pins are actually I/O pins -- they might be good candidates, particularly if their traces are routed in such a way as to be easily accessible for cutting.

I've learned that one of the ways to get some of the other, new Yeasu handhelds to go out-of-band involves dumping data out of the clone port, editing the data, and then dumping it back in. I called Yeasu and asked if the FT-470 could be cloned. They said no, so I ignored them. I haven't figured out how to get it to dump data, but I believe it will accept data. The clone mode is entered by powering up the unit with the F key held down. (It's also a neat way to see all of the indicators on the LCD!) The data must be presented in the ring ("right channel") of a stereo 2.5 millimeter plug which is placed into the mic jack. This is cryptically marked on the schematic, anyway. However, I have no idea what the format for the data should be. If you come across this, I'd love to know. This may be the trap door to getting the rig to receive and transmit in more interesting places.

Attributed: Ed Boakes (WB3FLD) att!hocpa!ewb

-=-

VHF Transmit mod:

Effect: Enables extended VHF transmit (this is exactly the same as one of the previously listed mods).

1) Open the radio such that the two halves open like a sandwich.
2) Locate the internal lithium battery
3) Locate several solder pads to the left of the lithium battery.
4) Just to the top left of the lithium battery is ONE vertical solder pad (a.k.a. R69). It is almost under the top left edge of the battery.

5) solder a jumper accross this pad.

Result: Extended VHF transmit

Bugs: The automatic repeater shift (- offset below 147,
+ above etc...) goes away with this mod.

Attributed: randall@informix.com (Randall Rhea)

-=-

Software UHF Receive Expansion:

Effect: extend UHF Rx to 500MHz without shrinking Tx range

How: Trick 470 into accepting big number in U register.

Caveat: This mod acts differently on different radios.

1) Turn the beep on. (Some, perhaps all, 470's require that
the key-press-beep function be on in order to do this.)
2) Program the frequency of 450.00 MHz simplex.
3) Set the repeater offset to zero (F/M RPT 0000) but DON'T
get out of the set mode (don't hit RPT again).
4) Turn the radio off then back on.
5) Set a "+" offset (press RPT twice).
6) Press the REV button one time.
7) The radio should now display 1450 MHz.(The radio will not
operate at these frequencies. My service monitor shows
that above 500 MHz the rx is very weak.)
8) Use the shifted down-arrow key to tune this frequency down to
around 500 MHz (press F/M, press and hold down-arrow). Yes,
this takes a while.
9) Store this in the "U" memory. (press and hold F/M until
you hear two beeps, rotate tuning knob until "U" appears in
upper left, press F/M again).
10) Reset the repeater offset to 5 MHz. (F/M RPT 0500 RPT)

Result: By selecting the "U" memory and the using the memory
tune fuction (select "U" memory and then press MR), you can
tune to the desired frequency and then store it in another
memory.

Bugs: Above 500 MHz, some radios will let you tune up and
down in frequency, some won't (they jump back to the ham
band). Some radios will let you enter a frequency above 500
MHz on the keyboard while in memory tune mode, some won't.

Attributed: Darrell Sego KM9S

-=-

Software Range Extention Tricks:

Effect: Force a non-standard frequency into a VFO, store this
as an upper limit in the "U" or "L" memory.

Caveat: For these steps to work properly, I had to have
"Beep" enabled and *NOT* have the "L" and "U" memories locked
out.

Steps for setting the UPPER UHF limit to 500 MHz

1. Program the frequency for 430.00 MHz *SIMPLEX*.
2. Press F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT key twice for a "+" (plus) offset indication.
6. Press REV button once.
7. The radio should now display 1430.00 MHz.
8. Press F/M then hold the down-arrow key to lower the
displayed frequency. Stop when 500.00 MHz is displayed.
9. Press RPT once to select simplex operation.
10. Press F/M and hold until you hear two beeps.
11. Rotate the (DIAL) knob until the channel "U" is displayed.
12. Press F/M again, you should hear a beep.
13. Press F/M then RPT then enter 0500 (5 MHz repeater offset)
then press RPT again.

- alternative procedure (faster but a little more complicated)

8. Press RPT twice to select the "-" repeater offset.
9. Press REV twice. Frequency shown should be 630.00 MHz.
10. Press F/M then hold the down-arrow key to lower the
displayed frequency. Stop at 500.00 MHz.
11. Press RPT twice to select simplex operation.
12. Go back to #10 in previous list...

Steps for setting the LOWER UHF limit to 400 MHz.

1. Program the frequency for 450.00 MHz *SIMPLEX*.
2. Press the F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT once (for a "-" (minus) indicated offset).
6. Press REV *THREE* times.
7. The radio should now display 050.00 MHz.
8. Press F/M, then hold the up-arrow key to increase the
displayed frequency. Stop at 400 MHz.
9. Store this in the "L" memory. (See above steps...)
10. Press F/M then RPT then enter 0500 (5 MHz repeater offset)
then press RPT again.

- alternative procedure
- note: this short-cut requires you to enter 430.00 MHz
in step 1.

5. Press RPT twice for a "+" (plus) indicated
repeater offset.
6. Press REV once.
7. Press RPT twice to select the "-" (minus) repeater offset.
8. Press REV once. You should have 1030.00 MHz displayed.
9. Press F/M and hold the down-arrow stopping at 999.00 MHz.
10. Press REV once. You should have 399.00 MHz displayed.
11. Press F/M, then hold the up-arrow) key to increase the
displayed frequency. Stop at 400 MHz.
12. Press RPT twice to select simplex operation.
13. go back to #9 in previous list

Steps for setting the UPPER VHF limit to 200 MHz.

1. Program the frequency for 140.00 MHz *SIMPLEX*.
2. Press F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT twice (for a "+" (plus) indicated offset).
6. Press REV *ONE* time.
7. The radio should now display 1140.00 MHz.
8. Press F/M, then hold the down-arrow key to decrease the
displayed frequency. Stop at 800 MHz.
9. Press RPT twice to select the "-" (minus) repeater offset.
10. Press REV once. You should have 200.000 MHz displayed.
11. Press RPT twice to select simplex.
12. Store this in the "U" memory. (See above steps...)
13. Press F/M then RPT then enter 0060 (600 Khz repeater
offset) then press RPT again.

Steps for setting the LOWER VHF limit to 100 MHz.

1. Program the frequency for 140.00 MHz *SIMPLEX*.
2. Press the F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT twice (for a "+" (plus) indicated offset).
6. Press REV *ONE* time.
7. The radio should now display 1140.00 MHz.
8. Press F/M, then hold the down-arrow key to decrease the
displayed frequency. Stop at 1100 MHz.
9. Press RPT twice to select the "-" (minus) repeater offset.
10. Press REV twice. You should have 100.000 MHz displayed.
11. Press RPT twice to select simplex.
12. Store this in the "L" memory. (See above steps...)
13. Press F/M then RPT then enter 0060 (600 Khz repeater
offset) then press RPT again.

Notes: To use the higher frequencies you have to select the "U" channel and press MR. This puts the handheld in the "MT" (memory tune) mode. From there you can scan down or use the (DIAL) knob to go to a lower frequency. ...Likewise for the lower frequency memory. Any frequency selected using this method can be stored in any memory.

My radio will not let me go up in frequency, only down. If I try, the rig will default back to the original ham band. I had to be careful when doing these mods.

One trick I found when initially setting up the VFO with the expanded upper and lower frequencies is that in steps 5 (and 9) if you select "+", pressing REV adds 1000 MHz to the display or subtracts 1000 MHz if it has already been added. If you selected the "-" (minus) repeater offset, pressing REV will subtract 400 MHz if the displayed frequency is 1000 MHz or higher, or subtract 600 MHz if the displayed frequency is below 1000 MHz, until any more subtractions would run the frequency negative, after which it alternatively adds or subtracts 600. You can mix the up-arrow down-arrow method with the "+ -" offset/REV combination to reduce the time getting to the desired frequency. With these tricks, many permutations can be found to get where you want to be very quickly.

I have discovered the code "5555" works as well as "0000" for the enabling code.

Attributed: fletcher@lode.uwyo.EDU (Walter Reid Fletcher, WB7CJO)

-=-

Fix One-Way Tune Bug in Expanded Receive:

Effect: Allow tuning in both directions when software range extend mods have been performed.

Due to a loophole in the tuning software, you may tune from the current frequency towards the normal operating range (430.00 - 450.00), but not away.

Unfortunately, you are still subject to the "tune one way only" syndrome. To bypass it, you must store some frequency in the "L" memory. It doesn't matter what this frequency is, but it has to be below the "U" memory and, preferably, below any other frequency you want to use. You may store a very low frequency here too (0.00MHz).

BUT, the software isn't that dumb. To trick it, both the "L" and "U" memories must be filled and active (not set for SKIP), AND you must access the out of band frequencies from the MT (memory tune) mode, AND you must start from either the "L" or the "U" memory.

To use MT:
1) Press MR and select either the L or U memory.
2) Press MR again, a small MT should appear on the left of the

display.
3) You may now tune with the arrow keys, Dial knob, or directly
enter frequencies with the numeric keypad.

Attributed: kd6hr.El_Segundo@xerox.com (Pete McAfee)
[ed. It looks like Pete may have been the first to discover some
of these neat tricks... any comments?]

-=-

Out of Band Sensitivity:

Effect: This is not a mod. Just information.

I measured the sensitivity of my Yaesu FT-470 over frequency
to see how well it holds up outside of the ham bands. I
wanted to see how useful the extended receive info being
handed out really was.

The measurement is a relative one. I was using an HP8657
Signal Generator, with the internal FM modulation set to 5 KHz
deviation and a 400 Hz tone. I input a signal with an
amplitude of -100 dBm directly into the RF input of the radio.
I noted the reading on the signal strength meter in the Yaesu.
On the VHF band the number nine was on steadily, on the UHF
band the number nine was blinking. As I changed frequencies I
adjusted the amplitude of the signal generator to keep the
signal strength meter on the Yaesu at the same level. The
amount I had to crank up the output of the signal generator is
the reduced sensitivity, here is the data:

VHF
freq: relative sensitivity:
136 -14 dB
140 -3 dB
144 +1 dB
146 0 dB reference point
148 -1 dB
155 -6 dB
160 -22 dB
165 -29 dB
170 -38 dB
174 -44 dB

UHF:
freq: relative sensitivity:
400 no reading, nothing, -infinity dB
401 -40 dB
402 -38 dB
405 -34 dB
410 -27 dB
420 -9 dB
430 +1 dB

440 0 dB
450 0 dB
460 -17 dB
470 -26 dB

Results: The radio is good outside the ham bands, but the sensitivity really starts to suffer. I hear the local police at 460.375 quite well, so -17 dB is still usable, but not as good as a scanner would probably be. VHF down to 100 MHz or UHF down to 400 MHz is a fantasy. As I mentioned in another post, if the frequency ranges are extended too far, you start picking up signals at the wrong frequencies. National weather service (162.4) received at 119 MHz, coast guard channel 12 (156.8) received at 200 MHz, 2 meter repeaters received around 190 MHz and again around 182 MHz. Its hard to say just what the usable ranges are, but something like 136-165 MHz in VHF and 410-470 MHz in UHF, and even then its not great at the ends of these ranges.

Attributed: frankb@hpsad.HP.COM (Frank Ball)

-=-

Hyperscan:

Effect: faster memory scan rate.

1) Go into Alt mode by pressing [F] 2 (Alt).
2) Press the Up or Down Arrow to activate the Memory Scan.
3) When the Scans stops on a VHF frequency on the Left Display (The Main Band), Hit [F] VFO.
4) Press the Up or Down Arrow to activate the HyperScan.
5) To Stop the Function, Press [F] Alt.

Result: Faster scan rate.

-=-

Extended RCV side effect #1:

I have found what I would consider an interesting side effect with my FT-470 now that I have performed the UHF extended receive modification. [not sure which UHF mod this is, ed.]

After I had done this mod, I found out that if I was scanning (in either Memory Tune mode or band-scan mode(between U & L)) the VHF side of the radio in the sub-band, and listening to an extended frequency in the UHF main band, the scanning would stop and revert back to whatever frequency it started from whenever a signal was received on the UHF side. (I don't know what frequency it reverts back to if you are scanning a VFO, but I do know that a similar thing happens).

-=-

1750Hz tone burst:

FT470's in the UK come with the 1750 Hz tone burst option built in. It is on a tiny sub card that is wedged in down the bottom at one side. I bought one from the UK distributors and figured out how to connect it when I got back to the US. As far as I can tell my mod is the same as would be done if it was officially installed although the service manual doesn't show where to connect it. It has just 3 wires, power, ground and audio out. It is activated by applying power using the small button above the PTT so you can press both at once to call and then slide your thumb down to release the tone button.

The board consists of a 2*color burst freq xtal and a 74HC4060 CMOS oscillator divider giving 7.16MHz divided by 4096 = 1748 Hz. The chip is surface mounted so they can get the whole thing down to less than 0.5" square.

-=-

Battery latch R&R:

To replace the battery latch simply remove the battery pack. Looking at the bottom of the transceiver you will see the battery retainer plate. Remove the 4 screws from each connor and lift the plate out. The battery latch will come with it. Part of the retainer plate is used as a spring for the latch. Stick the new catch on the end of the spring and reinstall in reverse order.

I have broken mine twice so far. The rest of the radio seems to be pretty rugged and I have given mine a lot of punishment so far and it seems to have taken it well.

Atrributed: rogerm@hpfcso.FC.HP.COM (Roger Mitchell)

-=-

Extended RCV side effect #1:

After doing the software receive mod, the radio will pick up 2m frequencies when the display is in the 180-190MHz range.

Also, the ARS (Automatic Repeater Shift) will turn on once in a while when scanning from 100 MHz to 200 MHz.

Attributed: plkorhon@vipunen.hut.fi (Mikko Noromaa)

-=-

Intermod Cure:

I sent my Yaesu 470 in to Yaesu U.S.A. almost a month ago for them to perform the modification to cure the intermod problem and got it back yesterday. They did cure the problem. There is no intermod at all on one repeater that I was previously getting killed on. There is also a noticeable improvement in the sensitivity out of band on the weather frequencies. The modification they performed made a great little radio a fantastic one. Though my radio is almost 2 years old they did the work free of charge. I tried to have them send me the parts to do it myself but I couldn't talk them into it.

>give me would be greatly appreciated.

Throw a wire out the window and string it up as high and long as
possible. Wrap a few turns (experiment to get the best number)
around the loopstick antenna in the radio, and ground the other end
of the wire to a cold water pipe or other suitable ground.
The radio will be MUCH more sensitive, but you may have a problem
with all the strong signals overloading the receiver.

Having gone from nothing to Advanced in about 7 months, studying the
ARRL guides mostly during lunch hour and vacations, I feel that I not
only could pass the exams, but I actually learned quite a bit about
amateur radio. And IMHO, anyone who just memorizes answers is
doing him/herself a great dis-service. But, since the exam question
pools are large enough, and the code requirements high enough, at
some point you have to put in some real effort to pass (whether it
be memorizing or studying). This required effort prevents amateur
radio from being flooded with ex-CW persons looking for more spectrum
to shout their 10-4 good buddy's. Bottom line, the exams are there to
weed out all but the most determined, and hopefully, you will actually
learn enough to be responsible along the way. :-)

2459. Small hf gain antennas?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-20 21:09:36 UTC
From: jeff@markets.amix.com
Message-ID: <1992May20.210936.17041@markets.amix.com>
Source record: 289542

I've been considering buying/building a compact beam or other
limited space antenna for HF. I currently use a vertical up
about 20 feet. No room for a tower; about the best I can
do is 30 feet of push up mast. I've been looking at this gossamer
quad in the ARRL books. This looks good, but I don't have any tall
trees to hang it from. Another thought is X beams. One was
described in CQ (or was it 73) a while back. Also, they are
described in the RSGB antenna book. Recently, in 73 (?) there
was an article for a shortened two-element 20 meter yagi that
looks good. Over near my sisters house (moraga, ca) someone
has a 5 element beam that looks like it is for 6 meters. However,
the ends of the elements have loops on them. My thought is that
its really a ten meter antenna. It doesn't look homebrew.

Anyone have any suggestions/opinions for compact gain antennas?
I'd rather build than buy, but if its mostly aluminum tubing, then
my observance of the price of aluminum tubing leads me to beleive
its cheaper to purchase a completed antenna.

I'm looking for a source of the following chips:

(a) Signetics NE561 -- an apparently discontinued chip that allegedly could be used, back in its heyday, to make a simple but functional synchronous detector for AM receivers.

(Why was it discontinued????)

(b) Fairchild 11C90 or another divide-by-10 (or 100 or 1000) prescaler that I could put in front of a frequency counter.
(My present counter goes only up to 200 MHz.)

have to assemble, debug and which have only 10 diode-programmable frequencies,
<<

Check out the June issue of 73 magazine. There is an article in there for thumbwheel frequency setting. You get 8000 channels tuning between 140 MHz and 150MHz.

Brad, you are right about it being over-priced and you need to have a lot of expensive test equipment to set it up but... I had a ball assembling it and one of these cold rainy winter days when I've stocked my lab with several thousand dollars worth of test equipment I'll have something to work on!

>lightning arrestors have a ground connector for this purpose.

While reading the mail on a couple of guys on 40M recently I heard
one of them suggest that burying a portion of the coax as it runs
betwen antenna and shack would provide some lightning protection.

Now intuitively this makes some sense....if lightning generates a common
mode voltage that exists on the shield of the coax, isn't it reasonable
to think that any arc-over would happen directly to earth ground instead
of coming into the shack to find the path out to ground through a ground
rod?

Intuition aside, does this in fact work?

2465. Icom IC-901 feature lie

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-20 23:31:45 UTC
From: emmayche@apple.com
Message-ID: <25386@goofy.Apple.COM>
Source record: 289599

I bought an Icom IC-901 (multiband VHF/UHF with control head) a while back, and I've been annoyed with it ever since. It's a great radio, and if not for the fact that Icom just plain ol' LIED about one of its features, all would be well.

The feature, you ask? Icom says "MARS and CAP coverage." This is just not true. Although the radio will cover the FREQUENCIES, it won't cover the repeater pairs due to the oddball offsets - the IC-901 (unlike its predecessor, the IC-900) only supports 25KHz offset steps! This makes it impossible to hit most CAP repeaters, and makes it very inconvenient - or impossible - to monitor some public safety agencies (both sides of the conversation) who have oddball splits (example: the California Highway Patrol has very weird splits in their 6m frequencies, one in particular being 320KHz).

Icom says there's nothing they can do about it, and while this may be true, I think that anyone else who owns one of these radios (and, at $900++, we tend to give them a LOT of our hard-earned money, folks) who agrees with my point of view should let Icom know how you feel about it. Those who disagree will probably need very little encouragement to tell ME how they feel about it, in great detail. :-)

Tangential subject: Anyone who has an idea about features which would make up the "ideal" multiband VHF/UHF (10m - 1.2GHz) radio, mail me and tell me what your features are (put "Ideal Radio" in the subject line) and I'll summarize and post.

2466. Looking for 70cm I&Q Demodulator

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-21 00:10:31 UTC
From: ddr@flux.isr.alaska.edu
Message-ID: <1992May21.001031.10048@raven.alaska.edu>
Source record: 289584
Cross-posted to: sci.electronics,rec.radio.amateur.misc,rec.radio.amateur.packet

Ideally, I'd like to find a box that takes in a fixed 70cm-band frequency and puts out baseband in-phase and quadrature signals. But I'd settle for an I&Q demodulator module that would work at or below these frequencies. The only modules that I've seen so far are for higher frequencies up in the cell phone range. I'm just trying to get out of having to tweak individual mixers.

Any leads to sources for such things would be appreciated.
Thanks,

>even green cash if you're so inclined and buy TWO, not one of
>them. They work great.

If those are the ones I'm thinking of, they're available in Australia
as well (cost about twice as much, of course). Normally on 55 MHz or
so, it comes down quite nicely to 52.525 (an Aust. freq). They have
independant receiver and transmitter sections, so a repeater offset
is no problem.

The output is genuine flea-power - milliwatts or so, and draws more
current on receive than on transmit!

Oh, and it confuses the heck out of the sales-droids when they produce
a pair of them, and you buy just one... :-)

>Or avoid Virginia and avoid the hassle.

>Gary KE4ZV

I was found NOT GUILTY (I was not guilty) by asking for their license
to operate an FCC transmitter. The bad part is that most of the
people in the courtroom who were also charged with speeding asked
for the license, and after a few of those, they took a recess.
Many of them won their case, although they apparently violated the

law.

In another example, the cop drove my friend home (who won his case) simply because my friend wasn't an a**hole, and the cop was a normal person like you and me.

He needed a ride home, because he expected to lose his case, which would have caused loss o' license.

Hmmm..... cops are people under pressure to produce milestones, just like software developers? Maybe we'll let them live!

2474. About the G5RV

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-21 03:01:01 UTC
From: emd@ham.almanac.bc.ca
Message-ID: <ews4kB1w164w@ham.almanac.bc.ca>
Source record: 289595

Re: G5RV Antennae feeds.

After reading some of the discussion regarding Louis Varney, G5RV's antenna design, I thought I'd make a few general comments, based on some articles of his I have read.

The original G5RV was designed by Louis Varney, G5RV as long ago as 1946. It was expected that an antenna tuner would be used between the 80 ohm coaxial feedline (or 72 ohm twin-lead) and the radio.

The G5RV was not designed to be a half wave dipole on it's lowest operating frequency (usually 3.5 Mhz) but instead a 1 1/2 wave centre fed doublet on 14.15 Mhz. The full length of the G5RV antenna top is 102 ft, made from two equal 51 ft lengths.

Instead of simply bringing down a tuned line or ribbon feeder, G5RV arranged there should be a 34 ft matching section of open wire feeder, which had connected to its lower end a length of either 75 ohm twin lead or 80 ohm coaxial cable.

(If 300 ohm twin lead was used for the matching section, it should be cut to 28 ft for the solid variety and 30 ft 7 in for the slotted version, to account for the different velocity factors.)

Unfortunately, the match to the coaxial or twin feeder at its junction with the the lower end of the matching section is only good on 14 Mhz and 24 Mhz. If 50 ohm coax is used, the VSWR on these bands will rise to 1.8:1.

In an article in 1984, Varney described in some detail the different loads presented to a 75 ohm feed line (either coaxial or twin) where it joined with the matching section. Here's a summary:

3.5 Mhz reactive load
7.0 Mhz reactive load
10.0 Mhz reactive load
14.0 Mhz resistive load, approx 90 ohms
18.0 Mhz high-impedance load, slightly reactive
21.0 Mhz high-impedance load, resistive
24.0 Mhz resistive load approx 90/100 ohms
29.0 Mhz high-impedance load, slightly reactive

From the above, it becomes obvious that a tuner should be used between the low impedance feeder (It's obviously even more

mismatched with 50 coax) and the radio.

Towards the end of the description of his antenna, G5RV mentions that the most efficient feeder to use is the open-wire variety, all the way down from the centre of the antenna to the equipment, with a suitable tuner for matching. He added that by using 84 ft of open wire feeder, the system would permit parallel tuning of the tuner on all bands.

If coaxial feeder is used, its weight will pull its centre down considerably, and may alter somewhat the expected radiation patterns.

So as you can see, the feed systems have varied considerably, with the only real constants being the 102 ft length and the half-wave matching section. If you've got the room and a way to bring it in, open-wire feed line is the way to go!

Some of this information came from an article published in our local FM bulletin, and the rest from the excellent RSGB book "Practical Wire Antennas" by John D Heys G3BDQ, which I highly recommend - especially for the non-engineers among us.

16616 BF 2223 0 17-May 1450 KB2NBN 8197_K2ZM MODS@NJNET ()
Sb: Kenwood TM-741A Cross-Band

The following was received via HAMLINK in the FidoNet BBS System

Kenwood TM741A Cross-Band

The following is the TM-741 & TM41 Cross-Band Repeater modification:

1. Remove, power, antenna, top and bottom covers.
2. Detach front panel assembly.
3. Locate and cut the GREEN wire on the control board on the body of the radio. This wire is towards the left of the board.
4. Locate and cut resistor R58. It is blue colored and located on the control board. This is the X-band modification.
5. Reassemble the radio.

To use the cross-band repeat option, select one band using the [Band Select] key (PTT will light up). Select the other band by pressing the [Control Select] key. This will set the band for two way cross band repeat.The green light on the key will light. If you want to repeat in one direction only (ie, no Auto Band Change) then use only the [Band Select] key and don't select a second band.
To turn on/off the repeater mode, press [F] and then [Mute].

Do you require the expanded RF mods as well? With the appropriate modules, the 741 will recieve, after mods, 18 - 54 Mhz
50 - 90 MHz
118 - 174 MHz
215 - 260 MHz
410 - 470 MHz
1100 - 1400 MHz

>get the case open! Has anyone else encountered this problem?
>Thanks,
>Ross Oliver

You do not need to open the case to get at the wires for the aircraft or the out of band modifications. You only need to remove the battery plate on the bottom of the radio. You will then see the blue (or red) wire which they describe in the manual. Clip or remove the one which they say. If you remove both of them you will have a bitchin' outta band radio that will cover 130-17~ RX/TX FM, and from 400 to about 485 RX/TX. RX sensitivity above 455 will drop off noticeably since for some strange reason those radios come tweaked right at about 420 MHz. If you want to slide the coverage on UHF upward, you will need to get into the radio and lay the boards out to access the UHF front end. To do this you must remove the nuts around the volume and tuning knob with a spanner wrench. Pulling off just the knobs won't do it. With a little tuning, you can get > .2uv coverage from 430 to 465 MHz. This might not be necessary as there is plenty of interesting stuff to listen to in the 400 - 420 range. There is no tuning on the 800 MHz band as it has its own separate front end.

The radio will transmit all over the place, but just remember all the legality BS that goes along with it. It's your license, not mine...

>stuff out on down the line. While this might be more economical
>for the manufacturer, in high intermod areas, this just don't work.
>I like the advice I've been hearing -- 'If you want a scanner,
>buy a scanner!'

The key here is "in high intermod areas". Not all of us live in high intermod areas. Where I live intermod is not a much of a problem and I only have a few non-ham frequencies I want to receive. I seriously considered the HTX-202, but a decided that a used Kenwood TH-26AT with an extended receive mod was a better choice for me. If I lived in Phoenix instead of Flagstaff, I would have purchased the HTX-202 instead.

>If you want the 800 Mhz and Air stuff and don't mind paying a little more,
>go with the 580.
>
>David Horak N5OFQ

I just received a 560 recently (used) and my only beefs with it are
the following : It's squelch seems to open with nothing but perfect white
noise on 2m. There is a signal on a particular frequency that causing a slight
quieting but no modulation. This happens quite frequently when I start
using outdoor antennae etc... and it seems that this is the way the 560
handles intermod - noise. This noise is only 1 bar in strength (ie. <S1)
and I can't squelch it out. The good thing is that the S-Meter doesn't
aimlessly wander up to about S5-9 and not break the squelch when I come
near computers etc... It is very good that way. I've also found the UHF
side to not be as sensitive as I'd like (compared to a friend's IC-04AT)
but that is probably mostly due to the stubby antenna. The scan speed is
horrendously slow when compared to radios like the FT-470 (14 ch/s). If
you want to scan a lot, I don't suggest the 560. I don't know if the 580
has improved in this area. As an aside, I can't seem to receive any
signals in the 411-412 MHz area even though the radio is rated for 400-500
(or something similar). I haven't played with this yet and there might be
a problem with my radio only. I know that this seems like a long list of
beefs but there is really only the one major point - intermod, and most
dual banders suffer this problem. It would be nice if it was squelchable,
thought, considering that the intermod-caused signal is so weak.

I am sure it will work, providing the voltage is high enough.
But remember, the outer jacket of coax is a pretty good
insulator and once penetrated, even if this scheme would
work well enough to protect your equipment, you have a hole
for water to come into the coax. Not good.

From article <4599@gold.gvg.tek.com>, by randyh@gold.gvg.tek.com (Randy Hall WA2AGE):
> Does anyone know what the new Icom radio is that is shown under the
> cover in the ads? Was it at Dayton?
>
> Randy
> WA2AGE

I believe that the new ICOM radio is the IC-728/IC-729. It replaces the IC-725/IC-726 at the low end of the ICOM HF line. List price for the IC-728 is reputed to be about $1100. By the way, it has passband tuning, among other things, so it would seem to make the IC-735 obsolete as well. They also sell an antenna tuner that goes along with it; perhaps the smaller box in the advertisements?

Anyone want to venture a guess at how long the IC-751A will continue to be available? This radio has been on the market for years. Heck, it doesn't even use the CI-V computer interface! Seems like it was obsolete quite some time ago.

Just another opinion from The QRPer.

Thanks for the interesting info. It still baffles me why
public service agnecies like police don't use digital/spread
spectrum or other similar advanced methods for their voice
communications when they are available to the general consumer.
Is it cost? Reliability? Compatibility with other agencies?
Compatibilty with their handhelds? Lack of bandwidth?

Peter

2484. Help with Balun

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-21 13:56:37 UTC
From: mark@ve6mgs.uucp
Message-ID: <1992May21.135637.5094@ve6mgs.uucp>
Source record: 289536

hatzakis@fovea.stanford.edu (Mike Hatzakis) sez:
>I am trying an idea of a dual verticle antenna and have been told that
>it's feedline impedance is 100 ohms, I wonder how difficult it is to
>throw together a 2:1 balun or are they cheap to buy (where ?) so
>that I may feed it with 50 ohm line ?

If the overall antenna system is 100 ohm, and these antennas
require 180 phasing (Balun style), and the fact that I figure each antenna
is 50 ohms (50+50=100) then here is what I recommend:

1/4 wavelength 75 ohm (RG-59/RG-11) to one antenna
3/4 wavelength 75 ohm (RG-59/RG-11) to the other antenna
parallel them and connect it to a 50 ohm (RG-58/RG-8...) line

The first 75 ohm section transforms 50 ohms to 100 ohms, the second does
the same but 180 degrees out of phase. Then the two are paralleled to
make 50 ohms Balanced ...

This kind of feed arrangement, or variation thereof, works for most phased
antennas, AND because of the 1/4 wave length or odd multiple thereof you are
ensuring a balanced (current) feed arrangement as well since you have
balanced voltage at the feed end of the 1/4 wave length lines.

Ciao, 73 de VE6MGS/Mark -sk-

What's that in milliwatts into a 'normal' antenna?

I think that's about -15 dBm and 0 dBm ERP. 30 microwatts and 1 milliwatt
into an isotropic antenna or a couple of dB less than that into a
well-functioning dipole.

How short is very short? I have a copper j-pole on my roof. I have about 6 feet of coax between it and where it enters my attic. The j-pole is 17 feet off the ground and the mounting section is grounded with 7 strand copper electrical wire that is 1/4" in diameter. This wire runs straight to the ground and is connected to an 8' copper clad ground rod. If I connect the ground connector on the arrestor to my ground wire, is this sufficient?

I'm looking for a source of the following chips:

(a) Signetics NE561 -- an apparently discontinued chip that allegedly
could be used, back in its heyday, to make a simple but functional
synchronous detector for AM receivers.

(Why was it discontinued????)

I might have one in a dusty plastic drawer somewhere but it could be
difficult to ascertain (:>).

I don't know the "official" reason for discontinuing the part but my
experience with it indicates that it had severe on-chip coupling between
the VCO and phase detector such that it was basically unusable (in
one-chip mode) above pretty low frequency. It's specs made one believe
that it could be a 20 M synthesized transmitter or VFO substitute for a
(then) crystal controlled 2M radio but the part couldn't do it. It
would phase lock but the internal feedback paths made it impossible to
get anything much better than a terribly wide spectrum with the correct
average phase out of it.
I think there are probably some better substitutes nowdays.

(b) Fairchild 11C90 or another divide-by-10 (or 100 or 1000) prescaler
that I could put in front of a frequency counter.
(My present counter goes only up to 200 MHz.)

I think this part should still be available from distributors. If not,
How about one of the Moto or similar UHF prescalers? Moto 12013 at least
goes to 600 MHz. It's dual-modulus and overkill but it should be
available. There is also a series of low power Fujitsu parts which
will go past 1 GHz. They are also dual modulus but don't include a
power of 10 so may not be what you want.

>designed to be built and *work*, usually at the expense of performance.

>It is getting to the point where food is the only thing you can save on by
>making yourself.

Last year I put together a garden. These were my costs:

1. 8 Tomato plants @ $0.69 each
2. 4 Basil plants @ $1.19 each
3. Bag o' lime: $2.39
4. Garden hose: $8.95
5. Shovels, rakes, other implements of destruction: approx $30.00
6. Trips to the garden store (round trip 12 miles at $0.25/mi): $3.00
7. Owl scarecrow to scare away the **^&^&^ squirrel: $9.95

Total: 64.57

Item #7 was entirely ineffective. The squirrel never managed to learn that
he didn't like green tomatoes. He would pick one, take one bite, then
toss it on the ground in disgust. The process was repeated often.

I finally got about 4 tomatoes. This averaged $16.14 per tomato. Next time
I will forgo the kit and buy the assembled product at the produce section
of the grocery store. Food can be expensive, but not nearly as bad as the
do-it-myself version. :-) (All in the spirit of good fun!)

I have a 24-hour format desktop alarm clock for RS for my shack.
Shortly after installing it, I started having problems with 'birdies' all over the 2m band. After narrowing it down to something within the house and running around unplugging every potential RF source in sight, I found that it was the clock itself. I opened it to find an extremely bad soldering job and unusually long wires. The assembly appears to have been done by someone that barely knew what end of the soldering iron to use. I have no idea how this unit could pass UL listings. After shortening the wires to reasonable length and cleaning up the connections, I have had not any problems.

RS or not, you may want to take a handie-twinkie along to see if that clock you are about to buy is actually a spread-spectrum transmitter.

Ok. Here is someone who thinks the Ramsey kits are a good deal. I bought one in Dayton last year (the 2m transceiver) and had a great time building it. The diode programming was exactly what I was looking for since I had in mind computer remote control of the radio. Were there some problems with the radio. Yeah, but I had pretty good support from Ramsey when I called, and I changed the design in a couple simple ways that made the rig work near spec, and be legal ;-) I had a great time putting it together, and learned a heck of lot more about RF engineering in this one project than the last 18 years of licensed operations has tought me!

> 2) In hindsight, the Ramsey kits are ridiculously overpriced for what

> a kit... think about it.)

Well, then you're being ignorant if you don't listen to them. Cuz it isn't that cheap. I've just recently gone through the exercise of looking into what it would cost to market a kit, and still make some profit off of it. The design I did is considerably simpler than the Ramsey radios, and mostly a digital design. The cost of the PCB was going to run between $10 and $15 in quantity. The parts cost was going to be about $30 in quantity. A reasonable manual costs $2, and packaging of the kit another $3. So you have $40 for the basic package. There is a standard multiplier of 4 to account for all of the distribution, R&D, and marketing costs. That puts the kit right at $120. When I looked at what it would cost me up front in detail I found the times 4 multiplier off, and the actual cost was going to be about $160 for me to make a $10 per unit profit. After all is said and done, it turns out that something of this complexity level just can't be sold for less than about $150. You claim that it can't cost more to put out a kit, well

actually, assembly and test time are significant, and would probably
add $20 to the $40 cost of my unit. Considering how they are
marketing the unit, I'm impressed with what they've been able
to achieve!

> 3) The Ramsey packet modem kit cost me $70 on a Dayton "special".
> It is basically a Baycom circuit with little documentation other than assembly

>
> 73 de kb8cne, Brad Banko

If you were trying to save $30 bucks, or the equivalent with the
transceiver, then you missed the whole point of the exercise of
buying a kit.

>be memorizing or studying).

I heartily agree with your HO (it is MHO also). The fact remains, however, that it is possible to become an Extra either by serious study or by a combination of memorizing, guessing, and the "Wheel of Fortune" method. Becoming an Extra on that latter basis may give the individual who did so some peculiar sense of accomplishment, but it is difficult to see how today's licensing procedure has increased the overall quality of the Amateur Service. To wit:

I am personally acquainted with Extras who can neither send nor receive 20wpm, who never could, but who were able to pass the test. This is a lot like not having a 20wpm requirement, IMHO.

I have personally observed Advanceds and Extras who were unable to find solutions to problems in simple circuits by applying the formulas they had to have "learned" for the Tech test. My EE "codless" Tech friends are a much richer resource than some of the products of the current system, IMHO.

>This required effort prevents amateur
>radio from being flooded with ex-CW persons looking for more spectrum
>to shout their 10-4 good buddy's.

I have heard this theory tossed about a great deal on this newsgroup. Is there any substance to it? Is there a substantive difference between a CBer asking "what's your 20 good buddy?" on 11 meters and an Extra asking "What's your QTH, OM?" on the local 2 meter repeater? Is there a substantive difference between CBers on 11 meters and Extras on 2 meters inquiring after each other's "handles"? Is there a substantive difference between CBers on 11 meters and Extras on 2 meters discussing the weather, their aches and pains, and what they had for lunch? I'm not suggesting that there's anything so terribly wrong with use of prosigns or discussion of trivial topics on FM-voice. We ought not to fool ourselves, however, into thinking that the current testing system has produced an elite body of superbly trained radio engineer-operators.

>Bottom line, the exams are there to
>weed out all but the most determined,

Bottom line: The Amateur Service has five purposes, of which creating an in-group that sneers at others without much reason is not included. A little more attention to advancing the state of the radio art and building a pool of trained operators would go a long way, however.

Bottom bottom line: The testing system we have in place today is in much more serious need of reform than merely updating the question pool.

>*together* and you can't ignore one while optimizing the other.
>Transmitters and antennas don't care about SWR, but they may care
>very much about the complex impedance present at their terminals.

Well, looking at the Technical Information booklet for the TS-930S
"Protection circuits that monitor SWR, temperature, and collector current
give added protection to the output transistors, should any of those key
parameters deviate from normal."

This makes lots of sense to me, because SWR bridges are a lot easier
to build than actual impedance bridges. Remember that you want to keep
a protection circuit simple--if its too complex it may fail more often
than the circuit its trying to protect! I suspect that many other rigs
use protection circuits that monitor the SWR,.

Actually, some transmitters don't care about the impedance
on the output--I've run my 10 watt 222 MHz SSB transceiver
into some pretty awful loads and never bothered the MRF 137
power mosfet final amplifier. Most of the 28 volt FETs are
pretty rugged when run at 12 volts. Of course, the power
output drops and the efficiency may get pretty terrible, but
even a little power is better than nothing when you just have
to make a contact ...

>Now that said, back to the G5RV. It seems that the flattop is *non-resonant*
>on every amateur band. That means that it's terminals will always present
>some value of *reactance*. If cable lengths are chosen appropriately, that
>reactance can be made to cancel the reactance of the lime acting as
>impedance transformer. Thus our 50 ohm line *can* be made to do matching
>as part of the *system* of antenna, ribbon line, coax, and transmitter.

Depends on the transmitter. With a typical transmitter designed
to see 50 ohms with an SWR protection circuit (your typical modern radio),
the length of the neglible loss coax may change the impedance presented to
the radio but not the SWR. But, since the radio worries about SWR when
deciding to shut down or not, changing the length of the line is usually

meaningless.

An exception occurs when you have a lousy open wire
to coax transition which causes the shield of the coax to radiate.
Not surprisingly, changing the length of the shield that radiates
does affect the impedance, since you are changing the antenna!

Now, if you have a radio with an adjustable output section,
such as a modern radio with a built-in antenna tuner, an older style
radio with plate and load controls, or a transmitter with a transmatch,
certain impedances will in fact tune up better than others (of the same high
SWR). Perhaps this is what Gary is referring to, though it is stretching
the definition of something that does matching, at least in my opinion.

A few weeks ago there was some discussion on one of the radio groups about the makeup of US call signs, I think it concerned the K/W thread. It may have also delt with what would happen when we ran out of XX#XXX calls in a given district.

Below is a list adapted from the CFR on how the US structures call signs. There is a method to the madness. This list is a few years old so there may have been some minor changes, but it is pretty close.

2497. Summer 1992 Callsign Database Update

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-21 15:47:33 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <l1nhglINNbch@west.west.sun.com>
Source record: 289610

Details/Info about The Summer of '92 CALLSIGN PROJECT

Rusty, N7IKQ and myself AA7BQ, are putting together a summer distribution of the FCC callsign database. The database, which is roughly a 50 Mb ASCII text file, will be distributed along with some sample (shareware) UINX C source code to handle fast indexing and retrieval.

The May 1 cut of the database has been ordered and should be available within about 5 weeks (yes, the government is slooooooow).

Distribution Media, Formats, etc.:

The preferred distribution format is 1/4 inch cartridge tape, with QIC-150 (DC6150) being the best. We also have 8mm Exabyte and can also support QIC-24 (DC600A/60Mb) tapes, as well as 9-track reel-to-reel tapes. Default data format is UNIX tar unless otherwise specified. Other formats include 'dd', 'cpio' and (gasp) EBCIDIC 'dd'. No sample source code will be available in the 'dd' formats.

Absolutely no floppy disk copies will be made.

Below is a sample entry for a single callsign from the data file (there are in excess of 500,000 such records in the file):

KB0A|FORRETTE||CLAY|H|28321|87048|97048|RT 2 BOX 343|SIOUX FALLS|SD|
57103|3 MI SW OF|BRANDON|*|E|||*

Fields are separated by the | character, and are:

call|lastname|jr/sr|firstname|mi|dob|effective|expires|mail_street|
mail_city|mail_state|mail_zip|loc_street|loc_city|loc_state|class|

Missing fields are not applicable. Fields with * are the same as corresponding field elsewhere: in the example above, the first * means that the location state is the same as the mailing state. Dates are in the mod(100) year plus julian days format.

Cost and Shipping:

The cost is $20 per copy. You must supply the recording media along with a self addressed and prepaid mailing label. Preferred shipping is via FED-X, UPS, and USPO in that order.

Proceeds will help cover the cost of obtaining the data from the National Technical Information Service (NTIS) which currently stands at over $700.

Ordering:

>But 86.6 ohms is "the characteristic impedance of the matching section"
>If you had a quarter wavelength of 86.6 ohm cable you would match
>the 150 ohms to 50 ohms.

Hmmm...well that comes from just grabbing the formula and cranking
instead of thinking about what it means. I did finally go to the
Smith chart and immediately saw the error of my ways.

Rotating around the 3:1 SWR circle, it looks like you need a
cable .17 wave long to go from 150-j0 to 50-j58. Then you've
got to get rid of the capacitive reactance.

The coax on a G5RV isn't really a 1/4 wave, I just grabbed
that number so I could (mis)use the Q section formula.
Since I don't find the G5RV in the Handbook or the Antenna
Book, I went out and measured mine. The flattop is 105 feet.
The twinlead is 36 feet. And the coax is 75 feet.

Now the flattop isn't resonant on any of the ham bands, by
design. On 80 meters it's a tad short so it will present
a capacitive reactance at it's terminals. According to
imterpolation of a chart in the Antenna Book, the terminals
of the flattop should present an impedance of 40-j100 at
3.9 Mhz. After traversing 36 feet of 300 ohm twin lead,
the impedance should be transformed to 11+j27. 75 feet of
foam RG58 is an electrical length of .71 wavelength. Continuing
to rotate, that leaves us at 90-j150.

I don't have my drawing tools out, so I could be off some
on the capacitance, it squishes up at that end of the chart.
And the Antenna Book chart may not be valid that far out.
Still, my IC735 seems to like the antenna without a tuner.
Perhaps the 27pf is absorbed in the output network, retuning
it enough to give a better match to 90 ohms.

2502. Experience with Long-Wire antennas

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-21 17:21:56 UTC
From: hatzakis@fovea.stanford.edu
Message-ID: <HATZAKIS.92May21172156@fovea.stanford.edu>
Source record: 289539

I have a question for the net. In my quest for the ideal
apartment antenna with a requirement of being inconspicuous
I have thought of using a long wire antenna in between the two
apartment buildings here and think I can get at least 100 to 120'
if I run it at an angle.e. I was thinking of using 24 or 26 bell
wire and running a feed jumper (20-30') down to my apartment window.
I bank on the fact that thin magnet wire is invisible to the naked eye
60' up in the air.

My question, what is the performance of such an arrangement ? Would
it be better to use a dipole or trappeeed dipole on the roof or
does such a long wire have comarable performance ? How low in freq
could I go with such an antenna with decent output ? I have a good
little tuner for this use which has a long wire connection.

Any experience or hints...??

Thanks for all your help... Mike WB2TBQ

Date: 1992-05-21 17:37:51 UTC
From: aga@gualala.Sitka.Sun.COM
Message-ID: <l1nnvfINN75g@jethro.Corp.Sun.COM>
Source record: 289615

I managed to squeeze a G5RV on an average city lot in the inverted vee con-
figuration. It has all the normal dimensions (102ft flat top 34 ft 450 ohm feeder) and is
then fed with about 25 feet of RG-8. I use a homebrew Ultimate trans-
match tuner. Question is to Balun or not to Balun ?? I've heard some conjecture
on the air that without a balun the openwire portion becomes unbalanced and be-
gins to radiate (presumably as a vertical radiator thus providing some low
angle radiation off the 34 ft section). Seems to be a difficult comparison to make as
conditions are changeable over time. Anyone have opinions as to which wayt to go ??

By the way the G5RV has proven to be the most effective, usefull and econ-
omical antenna I've used to date.

> My question is, does my ham ticket give me any special privledges in this
> area?

Probably not. Anyway, having such a device isn't illegal (at least
here in VA), using it is. I would suspect if my Yaesu FT470 could
detect radar and I used it for such they'd get me for it as well.

Why don't you just drive the speed limit and avoid killing yourself
and other innocent people who share the road with you.

I know of know preemption of federal law that would help in this
situation. It was certainly one of the things tried when NJ had
there anti-scanner law in effect. The FCC made a statement that
they are loathe to preempt local laws if they can avoid it and
suggested that hams modifiy their radios not to make them in violation.

As a result no PRB-1 type ruling was forthcoming to help hams.

|> I think that's about -15 dBm and 0 dBm ERP. 30 microwatts and 1 milliwatt
|> into an isotropic antenna or a couple of dB less than that into a
|> well-functioning dipole.
|>

The amount of power you need to feed into an isotropic antenna to
produce a field strength of 10,000 microvolts per meter at 3 meters
is:

(10,000 uV/m)^2
--------------- * 4 * PI * (3 m)^2 = 0.015 mW = -18.2 dBm
2 * 377 Ohms

The factor of 2 in the denominator of the first term is there
because field strengths are usually given as peak values, and we want
RMS.

For 50,000 microvolts per meter at 3 meters:

(50,000 uV/m)^2
--------------- * 4 * PI * (3 m)^2 = 0.375 mW = -4.2 dBm
2 * 377 Ohms

>10.0 Mhz reactive load
>14.0 Mhz resistive load, approx 90 ohms
>18.0 Mhz high-impedance load, slightly reactive
>21.0 Mhz high-impedance load, resistive
>24.0 Mhz resistive load approx 90/100 ohms
>29.0 Mhz high-impedance load, slightly reactive

I have the shortened G5RV (10-40) does the above transpose to;

7.0 Mhz reactive load
14.0 Mhz reactive load
21.0 Mhz high-impedance load, slightly reactive
29.0 Mhz resistive load approx 90/100 ohms

If it does this might explain why I am having trouble loading it up on
10 meters with my antenna tuner. The best I can get is 3:1. Also I am
feeding it with 50 ohm mini RG8. Just kinda wondering...

As someone is sure to correct me, I have misinformed people here
of the law in Virginia. The code states that it is illegal to use
a radar detector. It goes on to state that posession of the detector
in your car is assumed to be proof you were using it. An additional
paragraph states that if a detector is somehow not readily connectable
to power or acessible, that the law doesn't apply (footnote refers to
some due prcess concerns). So if you bring a radar detector to
Virginia, I'd recommend that you lock it in your trunk.

RMS.

That seems right if the spec is peak, I didn't realize that. In the
case of "toy phones", particularly at 49 MHz, I bet the actual field can
easily be reduced by several dB due to the realities of the "rubber
duckie" used. My Sony cordless phone at home is awfully short, maybe
6", and I bet it's efficiency is a good deal less than 50%. Thus the
actual transmitter power might be several dB higher than (Vspec
RMS)^2/Zfs) and still be within the allowed range.
That was part of the reason I said "about" in my original posting.

2521. Re: Icom IC-901 feature lie

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-21 22:44:49 UTC
From: allbery@NCoast.ORG
Message-ID: <1992May21.224449.6598@NCoast.ORG>
Source record: 289540

As quoted from <25386@goofy.Apple.COM> by emmayche@apple.com (Mark Hartman):
+---------------
| Icom says there's nothing they can do about it, and while this may be
| true, I think that anyone else who owns one of these radios (and, at
| $900++, we tend to give them a LOT of our hard-earned money, folks)
| who agrees with my point of view should let Icom know how you feel
| about it. Those who disagree will probably need very little
| encouragement to tell ME how they feel about it, in great detail. :-)
+---------------

I asked an Icom rep about the possibility of adding more memories to the IC-901 at Dayton. The upshot was: it can't be done (the CPU would have to be replaced --- is this stupidity or overengineered VLSI?). Next question: is there a successor to the IC-901 planned? The answer: no.

(For those unfamiliar with the IC-901: there are 13 memories per band unit, two of which are band scan limits and one is a call channel. This includes the wideband receive module, which supports 7 "bands" but shares the 12 memories among all of them, which makes the band-scanning memories almost useless. 2m, 220, and 440 are already full on mine, and I've several more frequencies I want to add on all three; neither 2m nor 220 can be band-scanned any more because I used those memories as general memories; I haven't bothered putting anything into the memories for the wideband receiver, because I don't want to try to choose which of some 35-40 (or more) frequencies I want to put there.)

I'm going to wait and see if Kenwood solves their 741 intermod problem if/when they release their rumored all-band mobile, instead of adding to my IC-901. Icom may have just lost a customer.

2522. QSL info needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-21 22:48:55 UTC
From: steve@carlyle.CArlyle.COM
Message-ID: <28273.steve@192.9.1.30>
Source record: 289538

Can anyone help with QSL routing on the following?

RO5OP, 4/4/91
RX3TT, 12/6/91 - W6GO List gives UZ3AXH, but that doesn't appear to be in the callbook
F1NBX, 3/8/92 - contest call?
HH3DX, 3/8/92 - contest call?
VP9/N1KRR, 3/8/92 - I'd try home call, but it doesn't appear to be in the callbook
VP8CEH, 3/29/92 - info I have is via G0NWY, but again, not in callbook

Thanks!

2523. ALINCO DR590T/599T Info?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-21 23:04:06 UTC
From: bparrish@hpcc01.corp.hp.com
Message-ID: <31640012@hpcc01.corp.hp.com>
Source record: 289524

I notice that some stores are offering substantial discounts on the ALINCO DR590T (2M/440 mobile). Apparently this is because of the introduction of the DR599T.

I'm wondering what are the differences (except for the red buttons) between the two.

Are there any problems with the 590?

Has anyone actually tried using the remote control feature? (I'm interested in that feature... my wife is all over our 3 acres, and we are a bit far from the local repeaters to hit them from home).

Thanks for any help.

Bill (KM6KV)

2525. Re: Kenwood Tm741A Mods needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 02:31:46 UTC
From: daveb@ssd.intel.com
Message-ID: <1992May22.023146.23505@SSD.intel.com>
Source record: 289544

1. I've done the crossband repeat mods and it works like a champ.
The audio is so clean that most people cannot tell you are crossbanding.
This allows me to walk around with an HT on low power (1/2 watt UHF)
and use the 50 Watt gain antenna on my truck as a repeater in the
parking lot... most of the time my application is parking the truck
at the road and walking into the mountains. Works great.

2. I've had some intermod problems on UHF right in the middle of the
ham band, while others with 741 in the same area do not. I'm still
investigating this.

3. I know at least one person who experienced such problems with 2m
intermod that they yanked out that deck and replaced it with 220 mhz.
(which the manufacturer says you cannot do... that you must have at
least the 2m deck in the radio... not true!)

In general, great radio.

Source record: 289545

I hope this isn't net clutter...

I was led astray in my first use of a speakermic with the 580... the local store claimed that my Yaseu speakermic would work just fine. It does. For audio. Apparently (I haven't verified this) the Yaseu circuit shorts 5v at very low current. Not enough to fry anything or change audio characteristics, but enough to drain the battery slowly.

In my examination of the mics from Alinco I found them to be a bit more than the Yaseu ($30) at $35, but otherwise identical. For a few more bucks, you can upgrade to a remote-control mic with a VFO/Memory mode switch, and two keys (up, down). This works as you would expect it to... the package is nearly the same size, has a sturdier clip that rotates (the standard clip is fixed in vertical orientation), and I'd swear the audio is slightly better (surely an illusion). All this for $43 bucks. As you can tell, I bit.

>

As I remember, the Magnum 6 was basicly a compressor. It could sound really 'mushy' if not set up just right. A much better match for the Drake Twins was the VOMAX from ETO (Erhorn Technology), it used a 5 or 6 band filtered design and packed a 'punch' and sounded good too.

2531. Standard C528

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 06:59:13 UTC
From: dplumb@cix.compulink.co.uk
Message-ID: <1992May22.065913.553@demon.co.uk>
Source record: 289481

Is the Standard C528 in use out there in the states, and does anyone have any
other mods for the set barring these:

Standard C520/C528 Modifications
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
This file is a compendium from to others being bandied about the place. It
is hoped this will be the better of them, being the easiest to follow!

o To open up the rx only up on the unit on VHF:
VHF F+0 F+D

o To add 320-400MHz, 400-480MHz, 820-900MHz, 900-980MHz:
UHF F+L F+0 F+B F+L F+3 A

o To Expand Tx/Rx coverage, do both the above in that order, then:
VHF F+6 change step to 12.5MHz A
F+8 F+8 F+C
Tune down to 144.9875
F+0 F+D PTT F+8 F+C

o To Store independent transmit/receive frequency in one channel:
Enter receive frequency into dial
F+D <mem number>
Enter transmit frequency into dial
F+D F+A F+<mem number> A

o To Clear the tx assignment offset:
F+D F+A <mem number>+A F+A A

o To Clone one set to another:
B B F+0 F+PS then key up on the set to clone from

Set mode key assignments:
The set mode allows a number of user parameters to be customised according
to individual taste. Set mode is initiated by pressing F+0. The following
are entered after going into set mode:

0 Turns off the beep tones on each keypress
F+0 Sets band edge limits, i.e. 0079=100-179, 400-479. 3060=130-160

1 Changes count of paging operations tone, one beep or 5
F+1 Set tx delay on carrier drop when using as cross-band repeater

2 Enables entry of the 1kHz figure on direct keypad entry
F+2 Stop scan on busy channel even if CTCSS doesn't match

3 Sets mod delay on paging Tx to either 450ms or 750ms
F+3 Switch UHF bands between 300/400/800/900
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

4 Mutes short noises during squelch operation
F+4 Keypad entry of 4 digit or 3 digit frequency

5 Turns on and off the auto power off function
F+5 Pager Audio Mute (effectively disables pager)

6 Enable/Disable the rotary channel knob when keypad locked
F+6 Fast tune (F+KNOB) gives either 1MHz steps, or 100kHz

7 Sets the CTCSS tone frequency
F+7 Either Dual Tone Multi Frequency, or Single Tone Frequency

8 Sets the offset repeater frequency
F+8 Cross Band Repeater Enable/Disable (Identified on display by a ".")

9 Changes the LAMP button into the REV button
F+9 Up and Down keys either act as the knob, or as 10MHz steps.

Quick Chart:

Standard C520/528 - Keypad Guide				
Key	Alone	With "FUNC" key	Key alone in set	In Set With "F"
0	0	Enter Set Mode	Mute keypad bleep	Set Band Edge Limit
1	1	Disable Transmitter	1/5 beeps when paged	Tx wait on c-b rept
2	2	Dual Watch Operation	1kHz entry on keypad	CTCSS Scan Stop
3	3	Select Output Power	Tx Delay on repeater	Switch UHF Bands
4	4	Frequency Lock	Mute during squelch	4/3 digit direct fr
5	5	Battery Saver Mode	Automatic powr off	Pager Audio Mute
6	6	Select Step Size	Enable tune in lock	Fast tune 1MHz/100k
7	7	CTCSS select TX/RX	CTCSS tone frequency	Single/Dual tone MF
8	8	Repeater Shift +/-	Set Tx/Rx split freq	Cross Band Repeater
9	9	Reverse Split	Make LAMP button REV	Up/Dn keys do 10MHz
*	Step Down	Search 1MHz band		
#	Step Up	Memory Shift		
A	Cancel			
B	Pager On	Set Pager Codes		
C	Mem Scan	Partial Memory Scan		
D	Dial/Mem	Store Dial In Memory		Extend RX coverage
VHF	Tx VHF	Enable VHF Only		
UHF	Tx UHF	Enable UHF Only		

To expand Rx coverage only
VHF F+0 F+D
To add 320-400,400-480,820-900,900-980
UHF F+L F+0 F+B F+L F+3 A
To Expand Tx and Rx coverage:

```
| VHF F+0 F+D A ; Extends RX coverage |
| UHF F+L F+0 F+B F+L F+3 A ; Gives 300/800/900MHz |
| VHF F+6 step to 12.5MHz A ; This appears to set a special condition |
| F+8 F+8 F+C ; within the unit which is stored with F+C. |
| tune down to 144.9875 ; All params must be correct for it to work |
| F+0 F+D PTT F+8 F+C ; And Store it |
|-------------------------------------------------------------------------|
| To store independent transmit and receive frequency in one memory channel |
|-------------------------------------------------------------------------|
| Enter receive frequency into dial |
| F+D <mem number> |
| Enter transmit frequency into dial |
| F+D F+A F+<mem number> A |
|-------------------------------------------------------------------------|
| To remove independent transmit frequency from memory |
|-------------------------------------------------------------------------|
| F+D F+A <mem number>+A F+A A |
|-------------------------------------------------------------------------|
| To clone one set to another |
|-------------------------------------------------------------------------|
| B B F+0 F+PS on both sets, and PTT on the one to clone from |
\-------------------------------------------------------------------------/
```

2533. Andrews Air Force Base Airshow

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 12:18:02 UTC
From: m14494@mwvm.mitre.org
Message-ID: <1992May22.121802.2717@linus.mitre.org>
Source record: 289553

Several people have asked about the big military airshow at Andrews Air Force Base in Maryland. The show is this weekend, and the expected attendance exceeds half a million(!). Over 400,000 attended last year, and the weather was lousy. It's beautiful weather this year, and they expect folks to flock to the show. Even in previous years, massive traffic jams resulted, so if you come, come early and be prepared to wait around a lot.

The show is 9am to 4:30pm today and Saturday. It will feature the Blue Angels at 3:07pm Friday and 1:15pm Saturday, the Golden Knights army parachute guys at 1:12 Friday and noon Saturday, flybys by F-16s, F-14s, AV-8s, and HH-65 helos. Current and historical aircraft are also on static (non-flying) display. Parking and admission are free. Good luck.

>Band Change) then use only the [Band Select] key and don't select a second
>band.

This will cause the other two bands to be re-transmitted on the selected
one, e.g., select two-meters, and anything on either of the other bands
will be transmitted to your HT..

>To turn on/off the repeater mode, press [F] and then [Mute].
^^^^^^^^^

press [F] for longer than one second, and then press [Mute]

>Do you require the expanded RF mods as well? With the appropriate modules, the
>741 will recieve, after mods, 18 - 54 Mhz
> 50 - 90 MHz
> 118 - 174 MHz
> 215 - 260 MHz
> 410 - 470 MHz
> 1100 - 1400 MHz

You may have to perform a "band reset" for this to work right. I had to.
>Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

I have - it works just as advertised. The only concern is that if
you use the crossband mod, you need to ID. You do this by having
someone on each band ID your remote base by saying something like
"This is W1XYZ, via KZ1O remote base". If you are doing a unidirectional
repeat, I don't know how it can be made legal, unless every 10 minutes
you turn off the repeat function, and then announce your callsign on
the output freq. Yuck-ptooey.

73,
Dave

P.S. I like my TM-741!

2537. Ramsey Kits

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 13:34:53 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GKB0QFRLPGFKMP9C@TNTECH.BITNET>
Source record: 289556

Well here is some personal experience:

I admit that I also learned a lot from building the Ramsey 2 meter kit and really enjoyed building it. I found however that on my particular kit you needed an expert electronics person with some considerable test equipment to set it up.. I have mine working ok but it only is putting out about 2 watts...I need to retune it and spread coils etc, but it turns out the process is very complex.

I had a person with a masters in EE help me... found I built the kit correctly but the kit wasn't on freq. there is a note in the manual about using capacitors to get the crystals on frequency. well we tried it.. and every other combination...couldn't get it right.. finally had to change the current to the crystals...put a not on E-mail and found that the original batch of crystals was cut too thin (thats what the person helping me had guessed also)..

Was told by a Ramsey tech that yes this was so and I needed to do something else with padding the crystals.. and that the manual was incorrect and that different value capacitors across different places was needed...got a little upset and sent a letter to Ramsey.. Mr. Ramsey insisted that the tech was wrong and was going to be "spanked" and that there was nothing wrong with the crystals and that the problem was caused by different builders using different lead lengths on the components.

I have corresponded with many people who have had similiar experiences...yes there were some people who built the rig...tuned it up and had it put out 5 watts or so right away.. it certainly seems to be the exception rather than the rule..

I now still need to go back and spend at least a day playing witht he coils and such and see if I can't get it to put out near 5 watts.

2538. Alinco DJ-580T Comments

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 13:48:43 UTC
From: dhm@cbnews.cb.att.com
Message-ID: <1992May22.134843.29866@cbnews.cb.att.com>
Source record: 289557

I have owned an Alinco DJ-580T for about a month and would
recommend it to anyone interested in a 2m/70cm dual bander.
I enjoy scanning, I have a Bearcat 200xlt, and selected
the DJ-580T primarily because of its capability to scan
high VHF and UHF bands along with having many useful amateur band
transceiver feature as well. I was thinking I would not have
to lug both a hand held and scanner when I was on the go.
The unit is really nice but I may still be packing the Bearcat.
I notice a couple of small problems.

1. The unit has a programmable scan feature where an
upper and lower frequency limit can be entered and
the unit will sweep between these frequencies looking
for activity. This is like the SEARCH mode in the Bearcat
world.

Out-of-the-box, the Alinco has a bug in its search
algorithm. Although it can receive from say 138-173,
it can not be placed into the programmable scan mode
unless one of the limit frequencies is in the amateur
radio band. In other words a search of 147.5 - 162 will
work but 160 - 162 won't. This is also true for the
UHF side as well.

At first I was a little discouraged since searching is
part of the fun of scanning, however after I made the
aircraft/800mc modification this problem disappeared.

2. When doing a programmable scan, the receiver will stop
scanning as soon as the signal strength is high enough
to break the squelch. This causes reception of many stations
to be off frequency and distorted requiring manual tweeking
to hear the transmission clearly.

3. The unit scans through channels and frequency ranges very
slow maybe 5 channels a second.

These problems are not really major but were unexpected.

I also made some current measurements that may be of interest.

Alinco DJ-580 Receiver current measurements.

Unless noted VHF and UHF frequencies are 146.670 Mhz and 442.600 Mhz,
battery save feature and display light are off. Receivers are
squelched. Voltage was measured at the power input terminal
of the transceiver. Current was measured with a digital VOM.

Supply Voltage

Description 7.5v 12.5v

Both VHF & UHF Rcv. 100.6 ma 101.1 ma
VHF only. 61.3 ma 61.8 ma
VHF only. (124.000 Mhz AM) 60.1 ma -
UHF only. 56.6 ma 56.8 ma
UHF only. (850.600 Mhz) 59.2 ma 59.7 ma

Miscellaneous Tests (at 7.5 volts)

VHF only, squelch off, med (hiss) volume. 67.7 ma
VHF only. Receiving station (162.550) medium vol. 75 - 91 ma
VHF only. Battery Saver On. Very erratic readings 19 - 63 ma

Notes:

1. Use of lighted display added about 61 ma. to all readings.
2. When scanning, Battery Save feature is automatically disabled.

2540. Summary: charging Nicad batteries from cigarette lighter

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 14:07:22 UTC
From: mangin@debussy.inria.fr
Message-ID: <20166@sophia.inria.fr>
Source record: 289562
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc,sci.electronics

--

Many thanks to all those who answered. Here are the intersting points:

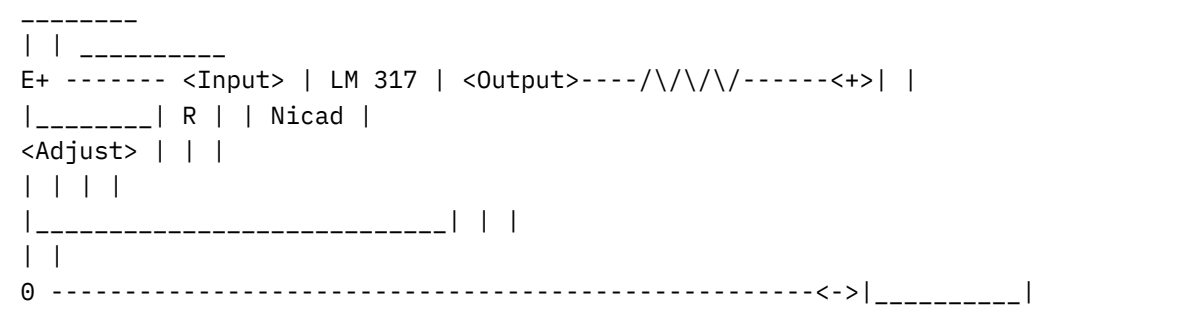
- There is no easy way of controlling the level of charge of a Nicad. Voltage isn't very accurate. Rapid chargers generally use a thermistor to detect over heating of the battery when it reaches full charge.

- The safest/simplest solution is to completely discharge the Nicad, and to charge for about 14h at 1/10 of the capacity (e.g. 70mA for a 700mAh nicad). Do not fully discharge serially mounted nicads (e.g. 7.2V battery pack): one of them may get discharged before the other ones, and see an inverse current run across it, which will damage it.

As for charging from "exotic" power sources (cigarette lighter, solar cells,...):

- A single resistance isn't sufficient, because the nicad's voltage is increasing when in charge, the car battery voltage may vary when the engine starts...

- A very simple solution is to use a LM317 as a current regulator. For those as ignorant as me in electronics, don't be afraid, it's really simple. Here's the design I've used:



The current is given by (1.2/R) (e.g. R=20 ohm ==> 60mA). The total price including connexions is about 4$ (Kenwood is selling an adaptator for cigarette lighter for about 58$!!)
The voltage of the nicad (i.e. the number of cells) doesn't matter as long as (1.2 + nicad voltage in charge) < E+ . It works at least for 1 to 6 nicad cells. I didn't try it whith a 13.6V battery pack.

- There is no filtering here, and I have no idea wether it would be necessary. I will use it only with the engine stopped.

>
>I know of know preemption of federal law that would help in this
>situation. It was certainly one of the things tried when NJ had
>there anti-scanner law in effect. The FCC made a statement that
>they are loathe to preempt local laws if they can avoid it and
>suggested that hams modifiy their radios not to make them in violation.
>As a result no PRB-1 type ruling was forthcoming to help hams.

Actually, in the Notice of Inquiry, the FCC posed several questions
to the industry and the ham community to try and see if it
was feasable to make transcievers that would not violate any individual
state laws. I'd suspect their will be no further action by the
FCC because with the change in NJ's law and a recent change in
Kentucky, there are no longer any states that have scanner
laws that affect hams. In the few states that do have some type
of absolute prohibition of scanners in automobiles, they all
now have an "exemption" for licensed hams (although one or two
of those states only give the exemption to certain license classes).

As to federal preemption, what often can happen is if an
individual "pushes" the issue to fight a particular law
(eg. radar detector ban) the prosecutor may simply "drop
the case" to avoid having the entire law thrown out. The
state would just as soon let you "off the hook" while
keeping the law. Remember too, it takes major $$$$ to
push a case through the courts, so most people can't take
that route.

One last item, and I know it really doesn't belong in this newsgroup,
but at least one other poster came back with the "why don't you
just drive the speed limit" and not break the law.
I own a radar detector. Not because I believe I have a right to speed, but
because I first have a right to rational and reasonable speed limits. Speed
limits on American highways are ignored because people drive at speeds they
believe are safe and efficient, regardless of what the signs say.
People that claim we should democratically set about changing
the speed limits are ignorant of the facts involved. The people,
despite their wishes and desire are often "over-ruled" by those
in political office because "they know what is best for us" or that
they want a country "based on the least common denominator driver."

Anyway, I don't want to take this further in this newsgroup, please
post any replies to rec.autos.driving

>
>I believe lightning arrestors do wear out after a number of strikes.
>The Alpha Delta brand includes replacable cartridges for this reason.

This depends on the type of arrestor, and the severity of the hit.
Some arrestors will work repeatedly indefinitely, but usually give
minimal protection. The gas discharge type is usually better, and
these can fail after one or more strikes. There are two types,
those that fail open and those that fail shorted. Unless you have
an EMP tester, you can't tell if one has failed open. The ones that
fail shorted are obvious, you can't hear anything and your transmitter
complains. I prefer the ones that fail shorted for home gear. At work,
we prefer the ones that fail open since we don't want to go off the
air until we replace the arrestor, and we have test gear that will
tell us if the cartridge is still good. Of course we're exposed to
damage until we replace the cartridge, it's a trade off.

Plus there's one other wrinkle. If you install the arrestor in front
of a shunt feed cavity, or most receivers, the pulse will find a
ready path to ground through the cavity or receiver input coil.
This can prevent voltage from becoming high enough quickly enough
to fire the gas tube before damage is done. Better coax protectors
are capacitively coupled on the equipment side. This allows the
gas tube to fire on the initial spike. Naturally, this also makes
the arrestor frequency dependent. That can present practical problems
in many ham stations where a single coax is duplexed to carry several
frequency bands or preamps are fed power up the coax. Another trade off.

>As to whether the radio will survive -- it depends on the radio.
>The lightning arrestor clamps the voltage spike at a few hundred volts.
>If the radio will survive that, then you're OK.

This point should be expanded just a bit. The voltage across the equipment
is important because devices in the radio may break down due to overvoltage.
But more important is the amount of current that flows *through* the radio.
That's why single point grounding is important. It can prevent most current
flow through the radio by shunting it directly to ground. It really doesn't
matter if the entire station momentarily goes to several thousand volts as
long as the *entire* station does so. That way there's no differential

voltage to drive high currents through the equipment, or between the equipment through the common rats nest of interconnecting cabling. A technique called "ground windowing" is required. That's where *every* cable that passes in or out of the station goes through one relatively small opening and is tied firmly to the system single point ground there via proper arrestors.

>Actually the coax cable itself acts as a kind of crude lightning arrestor.
>It will flash over at a few thousand volts. Of course this only works
>once!

I have some melted Belden 9913 to prove it!

>A very important point: The lightning arrestor only limits the voltage
>difference between the shield and center conductor of the coax. It
>does nothing to limit the common-mode voltage & current on the shield.
>To protect against this, you need a very short, fat ground connection
>to earth at the point where the coax enters the building. Most
>lightning arrestors have a ground connector for this purpose.

But some highly advertised brands do *not*. One brand has an *insulated* terminal for ground connection to the gas cartridge and *no* lug for the body of the arrestor. This can cause *more* damage than no arrestor at all. The center conductor surge will arrive delayed in time from the shield surge because of the velocity factor of the cable. The L di/dt drop across the gas tube and it's ground conductor can result in increased differential voltage across the equipment. Ideally the arrestor will have a massive mounting lug on the body of the arrestor that can be bolted directly to the ground window. In special cases, you may *want* the common mode currents to remain on the cable, such as an arrestor at the top of an *insulated* base tower with another arrestor *with* a common mode lug at the bottom of the tower after the shield break bolted directly to the ground field. In that special case, the arrestors without ground lugs are required. Usually though, you want to ground the cable shield to the tower at multiple points to short the single turn transformer formed by the tower and the cable. FM antennas on top of hot AM towers can be a bitch to protect properly.

>
>Intuition aside, does this in fact work?

Well, like most everything else, the answer is *it depends*.

You've first got to understand that lightning must be treated like RF. It obeys the same rules. Now the surge *inside* the coax will be slowed by the velocity factor of the cable while the surge on the *outside* of the coax shield will not. Depending on the length of the cable, the relative phase of the pulse will be aiding or opposing by the time it gets to the ground. If it is aiding, by grounding the shield you make the *differential* mode voltage higher. If it is opposing, you make the *differential* mode voltage lower. Now depending on the firing characteristics of your differential mode arrestor, and it's location in the cable, you may have helped yourself or hurt yourself by burying the cable.

In general, I tend to favor the idea of burying the cable, but it's no substitute for a good arrestor for both differential and common mode currents. By burying the cable, you *may* ruduce any inductive coupling to the cable, or not if you happen to bury it parallel to a ground radial that's carrying the brunt of the tower surge. Passing it through EMT can give a waveguide beyond cutoff suppression of the pulse on the outside of the shield as well as offering magnetic shielding against induced currents. Burying can be thought of as a poor substitute for EMT. The *jacket* on most ham grade coax is going to make the earth connection fairly poor, so not much actual grounding takes place. Usually there's a better ground through your equipment and lightning will find it. In a near miss rather than a strike, the voltage on the coax probably won't be high enough to flash through the jacket, but will still be plenty high enough to eat your radio.

For what it's worth, I do bury the cables from my tower to my station. But I bury them inside of conduit that *isn't* connected to my ground field. It's a magnetic shield only. Buried cables make the station neater, and makes mowing the grass easier. I use bury grade hard line. Burying ordinary coax can lead to water incursion and braid corrosion. Digging it up to replace it is a major pain.

I am in the process of building the older version of the kit: the FTR 146. I enjoyed building the kit too. There were frustrations to do with missing parts (one whole bag) and so on that took about three weeks and numerous phone calls to straighten out. While my TX is working, my receiver is not. I finally traced it to a bad first mixer and I have been waiting 10 days for a replacment part.

The transmitter tuned up fine right away and puts out reasonably clean 6.5W. My observation has been that the tank coils are critical. In the manual they recommend using a 3/8 18 bolt to use as a form for winding the coils. I did that and the coils looked like perfect helixes. On first try the transmitter put out about five watts. A little tweaking moved it up to over 6W. Then I noticed that my receiver wasn't doing to well and so worked on it a bit. The next time I tested the TX, it was putting out only 3W. So I guessed that I had disturbed the coils. Tried tweaking them. I spread them out just a teeny bit - in fact it seemed to spring back to the previous shape but I was back to 6.5W. The change in the coil was almost imperceptible. The moral of this story is that the coils have to be *perfect*. If you did not use a bolt as a coil form, it might be good to replace your current ones with new ones.

Boy did this irritate me. I had a frequency counter to check my
oscillators (as the Ramsey manual recommends.) The receiver oscillator
tuned up ok to the right frequency. Try as I might, I could not get
any of the transmitter oscillators to tune to the right frequency.
So I first suspected my handywork. Spent over two hours analyzing
it. The varactor and its biasing circuits were ok, the crystal was
oscillating and so on. But the crystal would not budge. Finally
I decided that the crystal must have wrong load capacitance. I called
Ramsey and they said yes they have had `variations' in crystals. Never
mind the fact that the variaion extended to all the tx crystals,
that we still shipped it out and never told you.

>Was told by a Ramsey tech that yes this was so and I needed

Yeah right. Do you believe him? All my lead lengths were really
short. My tx got going well right away after padding the caps
and put out 5 w on first try.

I've found that the antenna installation can be a contributing
factor for 741 intermod problems. In my case, I had significantly
more intermod using one particular duplexer over another. The duplexer
in question was one of the diamond (comet?) types which had two 1'
pigtail leads on it. When I exchanged it for one of the type without
pigtails, the problem went away.

Just another data point,

All this talk about cross band repeater mods lately, aren't they, er, well you know, technically illegal to use unless you ID them? Its a transmitter, right? And isn't it uncool to control them on the 2M side? I suppose its like out of band mods; none except the MARS mods could actually be used. (no type acceptance).

I've had a few encounters with new owners of cross-band radios lately, and nobody seems to be concerned about the legality of these things. The main problem seems to be just leaving the thing on so the owner can listen to a repeater that is being cross banded. Since the owner has no way to ID the output that he is listening to, how can this be legal? And aren't these things operating under the remote control sections of the FCC rules since they are controlled on a simplex frequency (if there is any control at all).

For example, I was listening to our local wide-area repeater the other day, and I heard two locals talking about how they use their new cross band repeating radios.

Ham #1 "Yep. Works great. I can set up my radio to crossband our 2 meter machine to UHF. I can hear that thing all over town, har har"

Ham #2 "Yeah, thats how I use mine! I can use it 20 miles away. I just leave it on all the time."

Hmmm. Duh. How do they ID the radios? Sure they could key up and ID one of the outputs, but how about the other one (the one they are listening to)? And if they are just listening, are they really going to key up every 10 minutes and ID the thing while two other hams are ragchewing on the repeater that is being crossbanded? (nope!). And can they be considered to be in "control" of the thing if they are 20 miles away?

And in addition, we have had problems with local hams setting up their cross band repeaters on an "unused" UHF frequency during our local skywarn weather net, in one case the cross-bander was using one of the UHF link frequencies that the repeater itself used for a remote receive site, causing that site to be rendered useless. (Guess he couldn't hear the link at his QTH). While I'm sure the interference isn't intentional, since the cross-band repeater is never IDed, we can't ask the person to move without DFing him, and nobody wants to DF during a thunderstorm!

Also, our local ARES group wants to set up a mobile cross band radio for "emergency" use. I asked about IDing it, but the answer was "oh well, we will be right there, so someone is in control of it." I explained how some provision would still need to be made to ID it, just like you still need to ID your HT even though it is right there in your hand ;), and

the answer then was "Well, it will be an emergency anyway". Hmmm.

It doesn't seem like it would take much for the manufacturer to build in
a programmable CW IDer to make these things legal. I know some of them
already have a transmitter time-out timer (probably to save the finals! ;)
Guess maybe I'm just being too sensitive about these things. 73

2552. Mini-QUAD ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 17:15:56 UTC
From: GIDEN@WSUVM1.CSC.WSU.EDU
Message-ID: <9205221715.AA28917@ucsd.edu>
Source record: 289566

A friend told me about an antenna he got from his father, a tri-band "MINI-QUAD". It is much smaller than the Quads currently advertised with a loading coil and an unusuall shape (not like the standard "quad").

Anyone familiar with a commercial quad by this name? If so, who's the vendor and are they still in existence?

ROBERT GIDEN, N7KCG (Wa. St. Univ.) Internet: GIDEN@WSUVM1.CSC.WSU.EDU

2554. Alinco 580 users manual posting rev 1.9

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 17:25:14 UTC
From: jay@zen.CAc.stratus.COM
Message-ID: <9205221718.AA18689@zen.cac.stratus.com>
Source record: 289569

Due to the incredible response of my last posting, I am posting
the 580 users manual to this forum. This will be my only posting
for this revision. The next revision is due out in the middle of
June. Please feel free to distribute as needed. The manual that
comes with the 580 has many mistakes and the index is virtually
useless. The many errors were due to the reformatting when my
manual went to Japan. The necessary process has been put into place to
assure that this doesn't happen again.

Please disregard all previous versions of this manual.

This manual has undergone grammar checking and detail checking like
MHz instead of Mhz. Many changes have been included to update the manual
to the line version of the 580. The previous manual was based on pre-
release 580 versions. Major corrections are shown with a "|" indicator
in the left margin. The manual is now upto 56 pages. Please feel free to
forward your comments to me at Jay_Appell@cac.stratus.com or you can sen mail to me at 125
Dutcher St. in Hopedale, Ma. 01747 or online BBS from 7AM to
9PM ET 508-478-6969 8/1/N.

Well you can't say that I'm not reachable! As always, thank you for your comments. Have
Fun!

Jay Appell (KA1SNA)

1 INTRODUCTION

We at Alinco would like to thank you for purchasing the ALINCO DJ-580T (US Model)/DJ-580E (European Model). Radios and other products made by ALINCO rank as some finest in the world. Your DJ-580T/E has been manufactured and tested very carefully at the factory and will give you satisfactory operation for many years. We are confident that you will be very satisfied with your choice of this fine ALINCO radio.

1.1 STANDARD ACCESSORIES

When you unpack your ALINCO transceiver, you will find the standard accessories which include:

1. Ni-Cad Battery Pack (7.2V @ 700mAH).EBP-20N
2. AC Wall Charger for EBP-20N.......EDC-24 (120V) DJ-580/T
3. Belt Clip
4. Hand Strap
5. Dual Band Rubber Flex Antenna
6. Schematic Diagram
7. Instruction Manual
8. Warranty registration card

1.2 OPTIONAL ACCESSORIES

To enhance your DJ-580 radio further, optional accessories are available. At ALINCO, we strongly recommend that you purchase appropriate accessories to get full features and performance from your radio.

1. Ni-Cad Battery Pack (7.2V @ 700mAH).EBP-20N
2. Ni-Cad Battery Pack (12V @ 700mAH) .EBP-22N
| 3. Dry Cell (6-AA) Pack EDH-6
4. Quick Ni-cad battery charger EDC-34
5. Mobile DC Power Cable/Charger
with Noise Filter. . .EDC-36
w/o. EDC-43
6. Earphone EME-6
7. DC cable for power supply. EDC-37
8. Earphone/Earphone. EME-6
9. Earphone/Microphone w PTT. EME-11
10. Speaker/Microphone EMS-2Z
11. Remote Control Speaker/Microphone. .EMS-8Z
12. Headset with PTT/VOX EME-10K
| 13. Soft Case. . . . . .ESC-17 for EBP-20N or EDH-6
14. Tone Squelch Unit. .(580-E). EJ-12U

2 SPECIFICATIONS

The specifications outlined for this product are for use in the amateur bands only. No guarantee or warranty, either specific or implied, will apply to any function or specification outside the amateur bands. Individual radios may experience different performance and/or specification levels. All specifications and features are subject to change without notice or obligation.

2.1 GENERAL SPECIFICATIONS

Channel Spacing: 5, 10, 12.5, 15, 20, 25 kHz
steps
Memory Channels: 42 Channels (20 VHF, 20 UHF)
1 VHF Call Channel
1 UHF Call Channel
Antenna Impedance: 50 Ohms unbalanced

Microphone Input Impedance: 2K Ohms
Signal Type: F3
Power Supply Requirements: 13.8 Volts DC
Dimensions (Radio Only):
Height = 140mm (4 1/8")
Width = 58mm (2 1/2")
Depth = 33mm (1 1/2")
Weight: Approximately 410g
DTMF: 16 Button Key Pad
Subaudible Tones: Encode and Decode installed

2.2 U.S. FREQUENCY COVERAGE

The frequency coverage listed as follows applies to the DJ-580T.

VHF Band: 144.000 - 147.995 MHz (TX)
130.000 - 173.995 MHz (RX)
110.000 - 173.995 MHz (RX)* Only after Modification
UHF Band: 440.000 - 449.995 MHz (TX)
420.000 - 479.995 MHz (RX)
870.000 - 890.000 MHz (RX)* Only after Modification

Note: I was unable to receive actual frequencies beyond 890 MHz.
Those of you who haven't run into 1st IF syndromes, try this.

Select a cellular frequency, and add the first IF for UHF
which is 23.05. Try the same example again but multiply the
first UHF IF by 2 (46.10). What did you see ?

2.3 EUROPEAN FREQUENCY COVERAGE

The frequency coverage listed as follows applies to the DJ-580E.

VHF Band: 144.000 - 145.995 MHz (TX)
130.000 - 173.995 MHz (RX)
130.000 - 173.995 MHz (RX)* Only after Modification
UHF Band: 430.000 - 439.995 MHz (TX)
420.000 - 479.995 MHz (RX)
870.000 - 890.000 MHz (RX)* Only after Modification

2.4 TRANSMITTER SPECIFICATIONS

Output Power: 2 Watts with Standard EBP-20N Battery
5 Watts with Optional EBP-22N Battery
Modulation System: Variable reactance FM
Max. Freq. Deviation: +/- 5kHz
Spurious Emission: Less than 60dB below carrier

Tone Frequency: 67.0 to 250.3 Hz (38 selections)
DJ-580T (Subaudible Encoding Tone)
DJ-580E (1,750 Hz Tone Burst)
Microphone: Electret Condenser
Operating Mode:
Simplex:

Duplex: 5kHz steps minimum between 0-15.995 MHz
from receiver frequency.
CTCSS Encoder: Built-in and included as standard
CTCSS Decoder: Built-in and included as standard

2.5 RECEIVER SPECIFICATIONS

Receiver System: Superheterodyne, Dual Conversion
Sensitivity: 12dB SINAD less than - 15dB per microvolt
Intermediate Frequency: VHF - 1st IF 55.05 MHz
2nd IF 455 kHz
UHF - 1st IF 58.125 MHz
2nd IF 485 kHz
Audio Power Output: 250 mw (10% Total Harmonic Distortion)
Speaker Impedance: 8 Ohms

2.6 BATTERY SPECIFICATIONS

The "PO" function selects output power levels. The
transmitter output power is determined by battery type and
output power setting.

2.6.1 EBP-20N BATTERY SPEC

The EBP-20N is supplied with your radio when purchased.

PO FUNCTION

Battery Capacity: 700 mAh
Output Voltage: 7.2 Volts
PO (Power Output Function): L - 0.25 Watt output power
M - 1.00 Watt output power
H - 2.50 Watts output power

Charge Times and Chargers: EDC-34 (120V) Approx. 1 Hour
EDC-35 (220V) Approx. 1 Hour
EDC-24 (120V) Approx. 14 Hours
EDC-25 (220V) Approx. 14 Hours

Charging Temperature: 0 to +45 Degrees C
Storage Temperature: -20 to +45 Degrees C

2.6.2 EBP-22N BATTERY SPEC

The EBP-22N is supplied with your radio when purchased.

PO FUNCTION

Battery Capacity: 700 mAh
Output Voltage: 12.0 Volts
PO (Power Output Function): L - 0.25 Watt output power
M - 1.00 Watt output power
H - 5.00 Watts output power

Charge Times and Chargers: EDC-34 (120V) Approx. 1.8 Hours
EDC-35 (220V) Approx. 1.8 Hours
EDC-24 (120V) Approx. 14 Hours
EDC-25 (220V) Approx. 14 Hours

Charging Temperature: 0 to +45 Degrees C
Storage Temperature: -20 to +45 Degrees C

3 DESCRIPTIONS

This section will discuss what the function or control is and how to use it. The subsections are broken down into smaller sections for easy access.

3.1 FRONT PANEL CONTROLS/FUNCTIONS

The following descriptions are those functions necessary to utilize full functionality of the DJ/580T/E.

(1) LCD DISPLAY PANEL

Refer to Section 3.5 for further details on the LCD display panel.

(2) CONTROL KEYPAD

The control pad includes 16 multi-functional command keys that control and execute various operations for the DJ-580T/E. It also serves as a DTMF keypad.

(3) MICROPHONE

An electret condenser microphone is built into the front panel. When transmitting, speak directly into the microphone from a distance of approximately 5 inches. The speaker/microphone connectors are labeled as follows:

Smaller Jack
(MIC JACK): Tip: PTT Line/Transmit Audio
Ring: 5VDC (for EME-10K option)
Sleeve: Signal Ground

Larger Jack
(SPEAKER JACK): Tip: Receive Audio
Ring: Remote Control (for EMS-8 option)
Sleeve: Signal Ground

| If you decide to use the V.U.SP jack while using the
| SPeaker jack, the VHF audio will not be heard. The VHF
| audio is routed through the V.U.SP jack.

(4) SPEAKER

The speaker is located below the key pad on the front panel. It's rated at 8 ohms and not in operation when an external speaker is used.

(5) VHF BAND KEY

Pressing this key allows for operation on the 2 meter VHF band.

(6) UHF BAND KEY

Pressing this key allows for operation on the 70 cm UHF band.

(7) SHIFT KEY

The SHIFT KEY is used to change frequency offset and shift.

The symbols - , + and star symbol are used to indicate shifts.

1. Press and hold the FUNC key, then press the SHIFT key repeatedly until the desired shift appears on the LCD display.

The - symbol indicates that the transmitter will subtract the offset with the transmitted frequency.

The + symbol indicates that the transmitter will add the offset with the transmitted frequency.

The star symbol indicates a split offset.

Simplex operation is active when neither the - or + or star symbol is displayed on the LCD display. If OFF appears in place of the frequency during transmit, the selected frequency is out-of-band.

2. Select the Main Band by pressing the VHF or UHF key. The LCD display returns to frequency.

*** NOTE ***

For larger incremental frequency changes press and hold the FUNC key then rotate the Main Tuning dial. This increments the 1MHZ digit.

Amateur radio repeaters utilize separate transmitter and receiver sections. The transmitter frequency may be offset either above or below the receive frequency according to repeater coordination conventions. The standard offset for the 2 meter band is 600 Khz. Offset for the 70cm band is 5 Mhz. Offset direction varies according to established band plans.

EXAMPLE: SHIFT

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the SHIFT key. An offset will be displayed on the LCD display.

3. Rotate the Main Tuning dial or press either arrow key to select the desired offset. For larger incremental frequency changes, press the FUNC key then rotate the Main Tuning dial.

4. Select the Main Band by pressing the VHF or UHF key or PTT key to complete offset procedure.

DJ-580T DJ-580E

VHF: 600 Khz (0.60) VHF: 600 Khz (0.60)
UHF: 5 Mhz (5.00) UHF: 7.6 Mhz (7.60)

(8) STEP KEY

The STEP function is used to select desired incremental changes of receive/transmit frequencies, in steps of 5, 10, 12.5, 15, 20 or 25Khz. Get more information on "GETTING STARTED" in section 4.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the STEP key. The channel step will change each time the STEP key is pressed. You can also change the channel step by using the Main Tuning dial, UP ARROW or DOWN ARROW keys.

3. Select the Main Band by pressing the VHF or UHF key to set channel step and return to operating frequency.

After channel step is set, the receive/transmit frequency will increase or decrease by the value selected when you turn the Main Tuning dial.

When the transmit frequency extends beyond permissible limits, Off will be displayed on the LCD display. The transmitter will not transmit when Off is displayed.

Refer to the following OFFSET frequency chart (TABLE 1) before you actually transmit. The transmitting frequency may differ from the frequency that appears on the lcd display.

LCD DISPLAY FREQUENCY ACTUAL FREQUENCY

***.*02.5 Khz ***.*00.0 Khz
***.*07.5 Khz ***.*05.0 Khz
***.*17.5 Khz ***.*15.0 Khz
***.*22.5 Khz ***.*20.0 Khz

***.*82.5 Khz ***.*80.0 Khz
***.*92.5 Khz ***.*90.0 Khz
***.*97.5 Khz ***.*95.0 Khz

TABLE 1 OFFSET FREQUENCY CHART

(9) REV KEY

The REV key allows instant reversal of the REV function is also useful to check the repeater input to determine if another station is heard directly so you can go simplex. To activate the REV function:

1. Press and hold the FUNC key, then press the REV key. The repeater input frequency and opposite SHIFT indicator will appear on the LCD display panel.

2. Press and hold the FUNC key, then press the REV key again to cancel the REV function.

If the frequency, as a result of the REV key being activated, is out of band, the beep will sound and no change will take place. The beep won't be heard through the speaker if it has been turned off.

(10) TONE KEY

The Tone Encoder and Tone (Decoder) Squelch function is standard on the DJ-580T/E. Tone Encode and Decode work on the Main Band only. The DJ-580T/E has 38 settings from 67.0 hz to 250.3 hz (TABLE 2). Utilize the TONE key to access these settings. Access to an increasing number of repeaters is restricted by requiring that a sub-audible tone be transmitted with the input signal to open the repeater. To select the needed tone, perform the following:

1. Press and hold the FUNC key, then press the TONE key. A tone frequency will appear in the LCD display.

2. Rotate the Main Tuning dial or either the UP ARROW or DOWN ARROW key to the desired tone frequency.

3. Select the Main Band by pressing the VHF or UHF key.

4. The tone has now been selected, now you need to enable it. Press the T.SQL key.

Refer to section 9.4 for more information.

Sub-Audible Tone Chart
==========
67.0 71.9 74.4 77.0 79.7 82.5

85.4 88.5 91.5 94.8 97.4 100.0
103.5 107.2 110.9 114.8 118.8 123.0
127.3 131.8 136.5 141.3 146.2 151.4
156.7 162.2 167.9 173.8 179.9 186.2
192.8 203.5 210.7 218.1 225.7 233.6
241.8 250.3

TABLE 2 SUB-AUDIBLE TONES

(11) PO KEY

Change power output levels by performing the following.

1. Press and hold the FUNC key, then press the PO key repeatedly to obtain the desired output power.

When H is displayed it means that the output power is at maximum/high for battery rating. When M is displayed it means that the output power is at mid range for battery rating. When L is displayed it means that the output power | is at the lowest range for battery rating. Refer to the | battery specifications for more on output levels.

*** WARNING ***

It is possible to cause UHF receive interference while transmitting on VHF. To avoid this from happening, make sure that the VHF frequency x 3 does not equal the frequency on UHF. For example, if VHF transmit frequency is 146.190 the UHF frequency should not be set at 438.570.

(12) T.SQL KEY

The Tone Encoder and Tone (Decoder) Squelch function is standard on the DJ-580T/E. Tone Encode and Decode work on the Main Band only. The DJ-580T/E has 38 settings from 67.0 hz to 250.3 hz (TABLE 3). Utilize the TONE key to access these settings. Access to an increasing number of repeaters is restricted by requiring that a sub-audible tone be transmitted with the input signal to open the repeater. To select the needed tone, perform the following:

1. Press and hold the FUNC key, then press the TONE key. A tone frequency will appear in the LCD display.

2. Rotate the Main Tuning dial or either the UP ARROW or DOWN ARROW key to the desired tone frequency.

3. Select the Main Band by pressing the VHF or UHF key.

4. Press and hold the FUNC key, then press the T.SQL key to display T and enable subaudible tone encoding. If T and SQL display, then tone squelch or tone decoding is enabled.

The tone frequency is now stored and will be transmitted
with the repeater input frequency.

TABLE 3 SUB-AUDIBLE TONES

(13) BEEP KEY

When the BEEP is on, each key pressed will sound a BEEP.

1. Press and hold the FUNC key, then press the BEEP key.
Each time the BEEP key is pressed the speaker will emit
a high or low pitch tone. If the tone is high pitch, the
BEEP is disabled, if low it is enabled.

The BEEP function, when set, will be activated on both bands.
The BEEP will sound only if the BEEP function is on.

The radio comes preset with a low/soft beep audio level. If
you would like to increase this level to high, perform the
following.

1. Press and hold the FUNC key, then press the * key. The
LCD will display FL.

2. Press and hold the FUNC key, then press the STEP key.
The display will indicate bEEPH, for beep tone high
level audio.

3. Press and hold the FUNC key, then press the STEP key.
The display will indicate bEEPL, for beep tone low level
audio.

4. Press and hold the FUNC key, then press the * key three
(3) times to clear FL/PL from the display and exit beep
tone level mode.

(14) TMS/VCS KEY

This key is used to select 1 of 3 scan modes. Refer to
section 8.3 for more information.

(15) APO KEY

This APO key is used to Automatically Power Off the radio.
The APO function prevents inadvertent waste of battery
power when the radio is left ON unintentionally. Here's how

to use it.

1. Press and hold the FUNC key, then press the APO key. You will see APo 30 displayed.

2. The time of 30 minutes is preset from the factory. The time duration can be selected by rotating the Main Tuning Dial. The time is adjustable from 5 to 60 minutes.

3. Press and hold the FUNC key, then press the APO key. APO is displayed on the LCD.

If no activity, a beep is emitted after this time and 30 seconds later the LCD display becomes blank. Battery power has now been removed from the radio. To re-initialize APO, turn the radio off and back on again.

4. Exit the APO function, select the Main Band by pressing the VHF or UHF key. The APO indicator should still be displayed on the LCD.

5. To cancel APO, press and hold the FUNC key, then press the APO key 2 times. The APO indication should now disappear from the display. Exit the APO function, select the Main Band by pressing the VHF or UHF key.

Any signal received during the APO time period, APO resets back to the beginning.

(16) DOWN ARROW AND FL/PL KEY

The DOWN ARROW toggles different values depending on what task you are utilizing. It is often used to decrease VFO frequency value. If this key is held down, the value will decrease continuously.

FL stands for Frequency Lock. In this mode the main keypad, SCN/PS and CALL/W keys are locked and don't function.

PL stands for Push To Talk Lock. In this mode both bands are locked from the Push to Talk switch. Frequencies can still be entered and stored.

These are useful features to prevent unauthorized functioning while the radio is in unattended monitoring mode. Here's how to use these features.

1. Press and hold the FUNC key, then press the FL/PL key. Each time you press the key, you will toggle the field which will be displayed as follows: FL, PL then FL and PL and finally both functions disabled.

(17) DUAL KEY

This function is used to monitor two particular channels. The possibilities are:

o VFO and MEMORY channels
o VFO and CALL channels
o VFO and VFO channels
o CALL and MEMORY channels

In other words, dual channel monitoring will listen to two channels. Here's how to make it happen for VFO and MEMORY. You can incorporate the same procedure with the other possibilities of DUAL WATCH.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the MR key. Select the desired memory channel by using the Main Tuning Dial.

The 2 digit memory channel number will blink if it hasn't been programmed. More on memory channel programming can be found in section 6.2.

3. Return to VFO Mode and enter a VFO frequency.

4. Press and hold the FUNC key, then press the DUAL key. The PRI indicator will now blink on and off on the display. The radio will cycle alternately between VFO frequency and Memory frequency for 1/2 second.

5. When a signal is received, the signal is held for 5 seconds.

6. To release the DUAL/WATCH function, press the PRI or chosen VFO key.

(18) UP ARROW AND MESS KEY

The UP ARROW toggles different values depending on what task you are utilizing. It is often used to increase VFO frequency value. If this key is held down, the value will increase continuously.

This MESS key is used for Digital Signal messages. Refer to section 11.7.

(19) PRI/DIAL M KEY

PRI stands for Priority. When the PRI key is pressed the priority function is active.

The DIAL M key is used for storing and automatically transmit a sequence of numbers/codes. This would be commonly used for autopatch use. Refer to section 10 for more information.

(20) GP DSQ/DSQS KEY

This key is used in conjunction with DTMF squelch control. More information can be found in section 11.

(21) SKIP/M TO V KEY

The SKIP key is used to skip selected memory channels during a memory scan.

The M to V function of this key is used to copy information from a memory location into the vfo.

(22) MR/MW KEY

MR stands for Memory Read. This function is used to examine what information is in a memory channel.

MW stands for Memory Write. This function is used to write/store frequencies and features into a memory channel. Refer to section 6.2 on for more information.

1. Press the MR key to put the Main Band into Memory Channel mode. A 2 digit memory channel number (0-19) will appear. These 2 digits will flash if nothing has been programmed into the memory channel.

2. Pressing the SCN key will increment each programmed memory channel one at a time. Use the Main Tuning Dial to either increment or decrement scanning.

(23) SCN/PS KEY

The SCN key is used to continually scan frequencies in VFO or memory mode. Press the key down for approximately one second and scan will begin. Scan is active by virtue of the flashing decimal point, just right of the 1 megahertz digit. To cease scan, press the SCN key once again.

PS stands for Programmable Scan. This is used when you want to scan a range of frequencies. You may scan a range of frequencies on VHF and perform the same for UHF at the same time. Here is how it works.

1. Select the Main Band by pressing the VHF or UHF key.

2. Now enter the lower range frequency via the keypad.

3. Press the MR key. Rotate the Main Tuning Dial and select memory channel P1.

4. Press and hold the FUNC key, then press the MW key. A beep will sound from the speaker and memory channel P1 will stop blinking. P1 has been successfully programmed with the lower frequency.

5. Now enter the higher range frequency via the keypad.

6. Press the MR key. Rotate the Main Tuning Dial and select memory channel P2.

7. Press and hold the FUNC key, then press the MW key. A beep will sound from the speaker and memory channel P2 will stop blinking. P2 has been successfully programmed with the upper frequency.

8. Select the Main VFO band as you did in step 1.

9. Press and hold the FUNC key, then press the PS key. The display will show scanning of ranges programmed between P1 and P2. The P indicator should begin to blink on the LCD display.

10. Exit programmable scan, select the Main Band by pressing the VHF or UHF key or SCN key.

(24) CALL/CALL.W KEY

Each band has 1 Call channel which is immediately accessible by pressing the CALL key. An often used frequency of interest such as a preferred local repeater, is usually programmed into the Call channel.

The CALL key is used to gain access to the CALL channel.

The CALL.W key is used to write information into the CALL channel.

Refer to section 6.3 for more information.

(25) LAMP KEY

1. Press the LAMP key to illuminate the LCD display. The lamp goes out automatically after five seconds.

2. If you wish for the lamp to remain on, press and hold the FUNC key, then press the LAMP key.

(26) MONI/BS KEY

MONI is short for the word MONITOR or SQUELCH OPEN. Activate this feature as follows:

1. Press and hold the MONI key to override the squelch on the band selected. In this mode, weak signals below the squelch threshold may be heard.

BS is short for Battery Saver. The battery saver feature reduces unnecessary battery drain by alternating between listening and the Battery Saver mode. If there is no operation for a period of 5 seconds the BS mode will listen for a signal for approximately 130 ms then Battery Save for approximately 390 ms. This cycle is repeated continuously.

Perform the following to activate or deactivate Battery Save feature. You can set this function in VHF or UHF or both bands together.

1. To activate battery save feature, press and hold the FUNC key, then press the BS key until the symbol S is displayed.

2. To deactivate battery save feature, press and hold the FUNC key, then press the BS key until the S disappears.

3.2 TOP PANEL CONTROLS/FUNCTIONS

(1) BNC ANTENNA CONNECTOR

You should attach a suitable Dual-Band antenna that will yield a low SWR. The antenna connected should satisfy both the 2 meter and 70 cm (440MHz) band.

(2) VHF VOLUME CONTROL

Adjusts the VHF audio level. Rotate control clockwise to increase volume , and counter clockwise to decrease.

(3) VHF SQUELCH

Start by turning the knob fully counter clockwise, then rotate the knob back clockwise until background noise is silent.

(4) POWER ON/OFF AND UHF VOLUME CONTROL

Power is not applied to the radio when the POWER knob is fully counter clockwise. When the POWER knob is rotated clockwise, power is applied to the radio and volume for the UHF band may be adjusted.

(5) UHF SQUELCH

Start by turning the knob fully counter clockwise, then rotate the knob back clockwise until background noise is silent.

(6) MAIN TUNING DIAL

Press the VHF or UHF key to select the Main Band. The Main Tuning dial may be rotated in either direction to select transmit and receive frequencies, frequency steps, subaudible tones and transmit frequency offsets. The frequency will increase/decrease by one MHz depending on the direction of the tuning dial rotation.

(7) SPEAKER JACK

An external speaker rated at 8 ohms may be plugged into this jack. The built-in speaker is disabled when an

external speaker is plugged into this jack.

| If you decide to use the V.U.SP jack while using the
| SPeaker jack, the VHF audio will not be heard. The VHF
| audio is routed through the V.U.SP jack.

(8) MIC JACK

An external microphone may be plugged into this jack.

(9) V.U.SPEAKER JACK

The DJ-580T/E features an external 1/8" stereo jack that makes accessible the audio supplied from each band (UHF/VHF). When a stereo headset is used, each band is heard separately, in each earphone. Separate external speakers may be plugged into this jack by using a mini dual stereo adapter plug. Volume from the VHF band will be heard on the left channel and UHF will be heard on the right channel. It is advisable to use the SPeaker jack when using a mono plug.

*** NOTE ***

When this jack is in use, the speaker jack located on the top of the radio will be disabled.

| If you decide to use the V.U.SP jack while using the
| SPeaker jack, the VHF audio will not be heard. The VHF
| audio is routed through the V.U.SP jack.

3.3 LEFT SIDE CONTROLS/FUNCTIONS

The following controls are located on the left side of the radio as viewed with front panel facing the operator.

(1) FUNCTION KEY

Controls access to secondary functions. These secondary functions are those functions printed in green on the front panel. It is necessary to activate the Function key to access these secondary functions. While holding the FUNC key, press the desired command key.

(2) PTT SWITCH

Press and hold this button to transmit. While holding the PTT SWITCH you may speak into the microphone.

*** NOTE ***

On the DJ-580E the lower portion of the PTT SWITCH is used to transmit Tone Burst, and the upper portion is the PTT SWITCH. On the DJ-580T either button activates PTT SWITCH.

(3) BATTERY LOCK BUTTON

The battery lock button releases the battery from the radio. The battery is keyed in order to avoid the battery from being inserted incorrectly. To attach the battery, slide battery in guides from left to right until the lock snaps battery into place. To remove battery, push and hold the lock button upwards and slide the battery to the left (from vantage point where radio front panel is facing you).

3.4 RIGHT SIDE CONTROLS/FUNCTIONS

The following controls are located on the right side of the radio as viewed with front panel facing the operator.

(2) DC IN JACK

Utilizing this jack will provide maximum output power. Plug an external 13.8 VDC power source into this jack.

*** CAUTION ***

Observe correct plug polarity. The tip of the connector is (+) and the sleeve is (-).

When a voltage source is applied to this jack the battery is cutoff and no charging to the battery will take place.

The EDC-36 or EDC-37 is recommended as optional accessories. Refer to section 1.2 for additional information on OPTIONAL ACCESSORIES.

3.5 LCD DISPLAY DESCRIPTIONS

(1) MEMORY CHANNEL

This 2 digit indicator shows that the selected band is in memory mode and displays the memory channel number.

(2) BATTERY SAVE

The symbol S appears while battery save function is activated.

(3) TONE ENCODER/TONE SQUELCH

The symbol T appears when tone encoder is active and TSQL when tone squelch (Decode) function is activated.

(4) PRIORITY/DUAL WATCH

The symbol PRI appears when PRIORITY/DUAL WATCH function are activated.

(5) AM

This symbol will appear when the aircraft modification has been performed. The symbol AM indicates that the AM detector is active.

(6) SPLIT

The star symbol appears when the split function is activated.

(7) TIMER SCAN

This T symbol appears above the (frequency) 10kHz digit. This symbol indicates that BUSY SCAN is activated. When the T symbol disappears, TIMER SCAN is activated.

(8) OUTPUT POWER

When the symbol L is displayed, LOW power is active. The indicator M is for MID power and H for HIGH power.

(9) DIALER

When the ~ symbol appears, the DIALER MEMORY is activated.

(10) SHIFT

The symbols +, - or star are used by the shift function.

(11) DSQ

When P or G and DSQ are displayed, DSQ functions are enabled. DSQ stands for DTMF squelch control.

(12) VHF

The VHF symbol indicates that the VHF band has been selected.

(13) FREQUENCY INDICATOR

Receive and transmit frequencies, offset and tone frequencies, channel steps, DSQ codes and dialer memory channel numbers are displayed in this area depending on the selected mode.

(14) AUTO POWER OFF

APO appears when AUTO POWER OFF is activated.

(15) ON AIR

The symbol ON AIR appears when transmitting.

(16) S/RF

In receive mode the S/RF symbol and Signal/RF bars will be displayed to show signal strength. When transmitting occurs, the ON AIR symbol and Signal/RF bars indicate RF output power.

(17) FREQUENCY DECIMAL POINT

When receive, transmit or offset frequencies are displayed on the LCD, the decimal point divides MHz and kHz.

(18) TONE FREQUENCY DECIMAL POINT

When the Tone frequency is displayed, the decimal point divides Hz and 0.1 Hz.

| *** NOTE ***
|
| This decimal point is also used to indicate that the PLL
| circuitry isn't locking in on the frequency entered. This
| will only be seen on radios modified for airband. In other
| words, you are unlikely to receive the frequency that you
| have entered when this decimal point is blinking within
| the frequency displayed on the LCD.

(19) PL (PTT LOCK)

The PL symbol indicates that the PTT switch is locked. The radio will not transmit even if the PTT switch is pressed accidentally.

(20) FL (FREQUENCY LOCK)

FL stands for FREQUENCY LOCK. When FL is displayed, the command and control function keys are locked out. Utilizing this function prevents accidental use of command and control pad keys.

(21) UHF

This symbol indicates that the UHF band has been selected.

4 GETTING STARTED (RECEIVING)

1. Adjust the following switches and controls on the top of the radio.

o POWER/UHF KNOB: OFF
o VOLUME CONTROLS: Fully Counter Clockwise
o SQUELCH CONTROLS: Fully Counter Clockwise

2. Connect a battery or external 13.8 Volt DC Power Supply to the radio.

3. Connect an antenna with the appropriate antenna connector to the top of the radio. The type of antenna fitting that is expected is a BNC type.

4. Rotate the POWER knob clockwise until power is applied to the radio.

5. Rotate the VHF volume control (left knob) and the UHF volume control (center knob) clockwise until a signal (or noise) is heard through the speaker. The display

should be illuminated and indicate frequencies for both bands. The initial factory delivered settings for VHF are found in Table 4, UHF in Table 5.

VHF

VFO Frequency: 145.000 MHz DSQ Setting: None
Memory Frequency: Empty Call Frequency: 145.000 MHz
Channel Step(580T): 5 kHz Tone Setting: None
Channel Step(580E): 12.5 kHz Tone Frequency: 88.5
Shift: None Transmitter Output: Mid
Offset Frequency: 0.6 MHz Call Freq.(580T): 145.000 MHz
Memory Channel: 1 Call Freq.(580E): 145.000 MHz

TABLE 4 VHF DEFAULT SETTINGS

UHF

VFO Freq. 580T: 445.000 MHz DSQ Setting: None
VFO Freq. 580E: 433.000 MHz Call Freq.(580T): 445.000 MHz
Memory Channel: 1 Call Freq.(580E): 433.000 MHz
Channel Step(580T): 5 kHz Offset Freq.(580T): 5 MHz
Channel Step(580E): 12.5 kHz Offset Freq.(580E): 7.6 MHz
Shift: None Tone Frequency: 88.5 Hz
Tone Setting: None Transmitter Output: Mid

TABLE 5 UHF DEFAULT SETTINGS

6. Rotate the Main Tuning dial, and select an open frequency on each band. Rotate the squelch control counterclockwise for each band until the S/RF indicator disappears from each band on the LCD display.

7. Select the desired band by pressing the VHF or UHF buttons. The VHF symbol will display on the LCD when VHF is enabled. The UHF symbol will display on the LCD when UHF is enabled.

*** NOTE ***

When the external power source is connected, make sure you power off the radio before turning off the power supply.

4.1 KEY PAD DIRECT ENTRY

When frequency is selected by key pad direct entry, numbers will appear on the LCD display as they are entered on the key pad.

To enter frequency directly from the key pad, try the following. The following example will use the two meter frequency 146.52.

1. Select the Main Band by pressing the VHF or UHF key.

2. Enter the 100MHz digit first. Example: 1--.---

3. Enter the 10MHz digit next. Example: 14-.---

4. Enter the 1MHz digit next. Example: 146.---

5. Enter the 100kHz digit next. Example: 146.5--

6. Enter the 10kHz digit next. Example: 146.52-

7. Enter the 1kHz digit last. Example: 146.520

If radio STEP is greater than 10kHz, the 10kHz digit will be the last digit to enter followed by a higher pitch beep.

If radio STEP is selected for 5kHz, enter the last digit.

4.2 STEP KEY

The STEP function is used to select desired incremental changes of receive/transmit frequencies, in steps of 5, 10, 12.5, 15, 20 or 25kHz. Use this feature as follows:

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the STEP key. Change the channel step by using the Main Tuning dial, A/UP ARROW or B/DOWN ARROW keys.

3. Select the Main Band by pressing the VHF or UHF key to set channel step and return to operating frequency.

4. After channel step is set, the receive/transmit frequency will increase or decrease by the value selected when you turn the Main Tuning dial.

*** NOTE ***

The following rules apply to channel steps as indicated.

When 5 kHz channel step is selected, keys 0 and 5 are available for entry into the 1kHz digit.

When 10 kHz channel step is selected, keys 0, 1, 2, 3, 4, 5, 6, 7, 8 and 9 are available for entry into the 10kHz digit.

When 12.5 kHz channel step is selected, keys 0, 1, 2, 3, 5, 6, 7 and 8 are available for entry into the 10kHz digit.

When 15 kHz channel step is selected, keys 0, 1, 3, 4, 6, 7 and 9 are available for entry into the 10kHz digit.

When 20 kHz channel step is selected, keys 0, 2, 4, 6, and 8 are available for entry into the 10kHz digit.

When 25 kHz channel step is selected, keys 0, 2, 5 and 7 are available for entry into the 10kHz digit.

4.3 KEYPAD ENTRY

When frequency is selected by key pad direct entry, numbers will appear on the LCD display as they are entered on the key pad.

1. Select the Main Band by pressing the VHF or UHF key.

2. Begin by entering the 100 MHz digit.

3. Enter the 10 MHz digit.

4. Enter the 1 MHz digit.

5. Enter the 100 kHz digit.

6. Enter the 10 kHz digit. If the radio is in 10 kHz or higher step, a beep will sound and the band indicator will stop flashing.

7. Enter the 5 kHz digit if the radio is set for 5 kHz step.

4.4 CLEARING ENTRY

To clear an error during key pad entry, you may:

o Press the VHF or UHF band key, or
o Press the PTT key.

4.5 MONO BAND FUNCTION

If you only want to use one band without distraction from the other band, follow these steps for mono band.

1. Switch off the radio.

2. Press either the VHF or UHF key while powering on the radio.

Restore dual band capability by pressing the inactive band key. If VHF is selected for mono band operation, press the UHF key to restore dual band operation.

5 TRANSMITTING

1. Make sure that you follow all steps set forth in the "GETTING READY" section (Section 4) first.

2. Select a frequency, shift direction, shift value, and PL tone frequency.

3. Check to see if the frequency is in use before transmitting.

4. Select appropriate transmitter output level by the switch located on the rear panel of the radio.

5. Press the PTT switch and speak approximately 5" from the microphone, located on the front of the radio.

5.1 POWER OUTPUT SETTING

There are three power settings on the DJ-580T/E. You may select either High (H), Medium (M) or Low (L) from the PO function on the front panel. Refer to the battery specifications for more on output levels.

Change power output levels by performing the following.

1. Press and hold the FUNC key, then press the PO key repeatedly to obtain the desired output power.

*** WARNING ***

It is possible to cause UHF receive interference while transmitting on VHF. To avoid this from happening, make sure that the VHF frequency x 3 does not equal the frequency on UHF. For example, if VHF transmit frequency is 146.190 the UHF frequency should not be set at 438.570.

5.2 LOW LEVEL BATTERY MODE

This function allows for extended use due to power drop in battery. The FULL indicator will begin to flash when battery drops to approximately 6.2 volts. When you operate your squelch just on the threshold, it will begin to open at approximately 4.75 volts. The sensitivity and transmit power will begin to drop at this time compared to normal operation. The radio will continue to operate until approximately 4.50 volts. At this point in time the battery should be charged.

6 TRANSCEIVER MODES

The DJ-580T/E has 3 modes; VFO mode, Memory mode and Call mode.

6.1 VFO MODE (Variable Frequency Oscillator)

The transceiver will be in VFO mode. This mode is used to change frequency and select the desired channel step, offset frequency (up to 10.995 MHz by 5 kHz), tone frequency (38 frequencies in Hz), Dual Watch, etc.

1. Select the Main Band by pressing the VHF or UHF key.

6.2 MEMORY MODE

The following guidelines will help you to program and manipulate memory channels. In memory mode, memory channels can be reviewed. Other features include Memory Scan, Memory Priority and Dual Watch. To select the memory mode, press the MR key. The memory used last will display:

o Frequency
o Memory channel number
o Other programmed functions

6.2.1 PROGRAMMING A MEMORY CHANNEL (MW KEY)

To write functions to any memory channel, it is necessary to first set those functions in the VFO mode.

o Select VFO mode (VHF or UHF band key).
o Select the receive frequency.
o Select the repeater shift - or + or split
o Select the required offset. Consult your Repeater Directory.
o Select the proper CTCSS subaudible tone "T". Consult your Repeater Directory.
o Select Tone Squelch (Decoder) "T SQL".
o Select Tone Frequency

After selecting and setting the required functions you can write (store) those functions to a memory channel as follows:

1. Select the Main Band by pressing the VHF or UHF key.

2. Select a frequency, shift direction, shift value, CTCSS subaudible tone, Tone squelch and Tone frequency.

3. Press the MR key. A two-digit memory channel number will be displayed on the LCD. If these digits are flashing, it means that this channel number has no information stored.

4. Rotate the Main Tuning Dial clockwise to choose the desired memory channel number (clockwise to increase, counter clockwise to decrease). Select the desired memory channel number (0 to 19).

5. Press and hold the FUNC key along with the MW key to write (store) frequency to memory.

6. Press the MR key to exit.

An alternate method for programming the memory channel is provided as follows:

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the MR key. A two-digit memory channel number will be displayed on the LCD. If these digits are flashing, it means that this channel number has no information stored.

3. Turn the Main Tuning Dial clockwise to choose the desired memory channel number (clockwise to increase, counter clockwise to decrease). Select the desired memory channel number (0 to 19).

4. Select a frequency, shift direction, shift value, CTCSS subaudible tone, Tone squelch and Tone frequency.

5. Press and hold the FUNC key along with the MW key to write (store) to memory.

6. Press the MR key to exit.

6.2.2 SCROLL MEMORY

Scrolling the VHF or UHF bank of memory channels up or down can be accomplished 1 of 2 ways.

MR KEY

1. Press the MR key to put the Main Band into Memory Channel mode. The memory channel number (0-19) will appear. A flashing channel number indicates that no information has been programmed into this memory channel. Turn the Main Tuning dial to increment and decrement the memory channel or use the UP ARROW/DOWN ARROW keys.

2. Press the MR key to exit MEMORY MODE and return to VFO MODE. The two digit memory channel will disappear from the LCD display showing that you have returned to VFO MODE.

You can scan the memory channels with the SCN key, elect to skip any memory channel with the SKIP key, or select the scan type with the TMS key. Refer to the section SCANNING FUNCTIONS (Section 8) for more information.

The DJ-580T/E has two (02) banks of memory channels:

First, the VHF bank has 20 memory channels that are accessed with the MR key.

Secondly, the UHF bank has 20 memory channels that are accessed with the MR key.

6.2.3 CANCELING A MEMORY CHANNEL

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the MR key.

3. Rotate the Main Tuning Dial to choose the desired memory channel number (clockwise to increase, counter clockwise to decrease). Select a non-flashing memory channel number (0 to 19).

4. Press and hold the FUNC key, then press the MW key to cancel this memory channel. The two digit memory channel number will now begin to flash indicating that the content of this memory channel has been cleared.

6.2.4 ALLOCATION OF MEMORY CHANNELS

Using this feature will allow you to free up memory channels from either band and allocate to the other band for frequency storage.

EXAMPLE: FREE MEMORY CHANNELS

Lets say you wish that you had 25 programmable VHF memory channels but the radio comes defaulted to 20. No problem, that's why this feature has been included. Since the radio has 40 channels in total, 20 for each VFO, it is possible to allocate all 40 channels to one band for memory programming. This scenario would leave the other band with no programmable memory channels. Here is how to make it all happen.

1. Press and hold the FUNC key, then press the * key. The symbol FL will appear on the LCD display.

2. Press and hold the FUNC key, then press the 1 key. The number of allocated memory channels for each VFO will appear on each band display.

When the Main Tuning Dial is rotated clockwise, the number of possible VHF memory channels will increase. This number will increase while the allocated memory channels from the UHF side will decrease.

When the Main Tuning Dial is rotated counter clockwise, the number of possible UHF memory channels will increase. This number will increase while the allocated memory channels from the VHF side will decrease.

3. Press and hold the FUNC key, then press the * key four (4) times to clear FL/PL from the display and exit beep tone level mode.

6.2.5 MEMORY TO VFO COPY FUNCTION

This function is used to copy details of a memory or call channel into a VFO.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the MR key.

3. Select a memory channel number by rotating the Main Tuning dial.

4. Press and hold the FUNC key, then press the C key. The information from the memory channel has been copied to the VFO, currently displayed.

6.3 CALL MODE

The CALL mode allows a single key to use an immediately desired programmed frequency. Each band has one Call Channel which can be accessed by pressing the CALL key. A preferred local repeater is usually programmed into the Call Channel. The indicator C appears on the LCD when Call Priority and/or Dual Watch function is active.

6.3.1 PROGRAMMING THE CALL CHANNEL (W KEY)

To write functions to a CALL Channel, it is necessary to first set those functions in the VFO mode.

o Select VFO mode (VHF or UHF band).
o Select the receive frequency.
o Select the repeater shift - or +
o Select the required offset. Consult your Repeater Directory.
o Select the proper CTCSS subaudible tone "T". Consult your Repeater Directory.
o Select Tone Squelch (Decoder) "T SQL".
o Select Tone Frequency

After selecting and setting the required functions you can write (store) those functions into a CALL Channel as follows:

1. Select the Main Band by pressing the VHF or UHF key.

2. Select a frequency, shift direction, shift value, CTCSS subaudible tone, Tone squelch and Tone frequency.

3. Press and hold the FUNC key, then press the CALL key. The frequency selected in step 2 will be stored into the CALL channel. The C indicator appears on the LCD showing you that your current mode is CALL channel mode.

4. Press the CALL key again to return to previous mode and frequency.

6.3.2 ACTIVATING CALL CHANNEL

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the CALL key. The CALL indicator C will appear on the LCD display.

3. Press the CALL key again to return to previous mode and frequency.

6.3.3 CALL CHANNEL TO VFO COPY FUNCTION

This function is used to copy details of a memory or call channel into a VFO.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the CALL key.

3. Press and hold the FUNC key, then press the C key. The information from the call channel has been copied to the VFO, currently displayed.

7 PRIORITY FUNCTIONS

The following priority functions are available:

o VFO Priority
o Memory Priority
o Call Priority (Dual Watch)

7.1 VFO PRIORITY

In this mode a VFO frequency is received for 4 seconds and a Memory frequency is received for 1/2 a second. This cycle will repeat continuously. Here is how it works:

1. Select the Main Band by pressing the VHF or UHF key.

2. Select and enter a frequency.

3. Press the MR key to activate Memory mode. If the memory channel is blinking, it hasn't been programmed.

4. Rotate the Main Tuning Dial to a desired Memory Channel that has been programmed. You may also use the UP ARROW or DOWN ARROW key to change memory channels.

5. Return to the Main Band VFO as you selected in step 1.

6. Press the PRI key to begin priority function. The LCD will display PRI.

7. Press the PRI key to stop the priority function. The LCD will remove the flashing PRI from the display.

*** NOTE ***

When a signal is received on the memory channel a BEEP will be emitted once from the speaker.

In VFO priority, the transmitter may be activated on either frequency. Press the PTT switch when the desired frequency is displayed on the LCD.

7.2 MEMORY PRIORITY

In this mode a Memory frequency is received for 5 seconds and a VFO frequency is received for 2 second in a continuous cycle. Here is how it works:

1. Select the Main Band by pressing the VHF or UHF key.

2. Select and enter a frequency.

3. Press the MR key to activate Memory mode. If the memory channel is blinking, it hasn't been programmed.

4. Rotate the Main Tuning Dial to a desired Memory Channel that has been programmed. You may also use the up or DOWN ARROW to change memory channels.

5. Press the PRI key to begin priority function. The LCD will display PRI.

6. Press the PRI key to stop the priority function. The LCD will remove PRI from the display.

*** NOTE ***

When a signal is received on the VFO frequency a BEEP will be emitted once from the speaker.

In memory priority, the transmitter may be activated on either frequency. Press the PTT switch when the desired frequency is displayed on the LCD.

7.3 CALL PRIORITY

The VFO frequency or Memory channel is scanned for approximately 1/2 second and the programmed CALL frequency is scanned for approximately 4 seconds.

1. Select the Main Band by pressing the VHF or UHF key.

2. If the CALL channel hasn't been programmed yet, refer to section 6.3.1 for more information.

3. Enter a frequency into the VFO or select a Memory channel in memory channel mode.

4. Press the CALL key for approximately 1/2 second. Call priority will begin to cycle between the CALL channel and the selected VFO or memory channel.

5. Press the PRI key to begin priority function. The LCD will display PRI.

6. Press the PRI key to stop the priority function. The LCD will remove PRI from the display.

*** NOTE ***

When a signal is received on the VFO frequency a BEEP will be emitted once from the speaker.

In CALL priority, the transmitter may be activated on either frequency. Press the PTT switch when the desired frequency is displayed on the LCD.

7.4 DUAL WATCH FUNCTION

Unlike priority, there is no period for listening between two modes. Dual Watch is a constant monitoring of two modes.

7.4.1 VFO/MEMORY DUAL WATCH

Perform the following for VFO/MEMORY DUAL WATCH.

1. Select the Main Band by pressing the VHF or UHF key. Enter a desired frequency.

2. Press the MR key and select the desired memory channel.

3. Return to the VFO mode as selected in step #1.

4. Press and hold the FUNC key, then press the DUAL key. The radio will begin with the VFO frequency followed by the memory channel frequency. The cycling between these frequencies is approximately .5 second.

5. Press the VFO button as selected in step #1 to stop DUAL WATCH.

*** OPERATING HINT ***

Without stopping DUAL WATCH operation, you can enter a new frequency into the selected VFO and DUAL WATCH will continue automatically. Enter the new VFO frequency via the key pad. DUAL WATCH operation will be suspended while you are entering the new VFO frequency, but will resume operation after you have completed entry.

7.4.2 CALL/VFO DUAL WATCH

Unlike priority, there is no time period for listening between two modes. Dual Watch is a constant monitoring of two modes. Perform the following for CALL/VFO DUAL WATCH.

1. Select the Main Band by pressing the VHF or UHF key. Enter a desired frequency.

2. Press the CALL key. The CALL channel must be programmed.

3. Press and hold the FUNC key, then press the DUAL key. The radio will begin with the CALL frequency followed by the VFO frequency. The cycling between these frequencies is approximately .5 second.

4. Press the Main Band key as performed in step 1 to stop DUAL WATCH.

7.4.3 CALL/MEMORY DUAL WATCH

Unlike priority, there is no time period for listening between two modes. Dual Watch is a constant monitoring of

two modes. Perform the following for CALL/MEMORY DUAL WATCH.

1. Press the MR key and select the desired memory channel.

2. Press the CALL key. The CALL channel must be programmed.

3. Press and hold the FUNC key, then press the DUAL key. The radio will begin with the CALL frequency followed by the memory channel frequency. The cycling between these frequencies is approximately .5 second.

4. Press the VFO button as selected in step #1 to stop DUAL WATCH.

8 SCANNING FUNCTIONS

The DJ-580T/E offers various scanning options and 3 scanning modes described a little later on in this section. First lets look at the scanning options, they are:

VFO Scan - Scans either band independently.

Program Band Scan (VFO Mode) - Scans programmed lower to upper frequencies. You may scan a range of frequencies.

Memory Scan - Each band may scan memory channels independently.

8.1 VFO SCAN

Each band may scan VFO channels independently. When in Band Scan mode the DJ-580T/E scans by Channel step, by 100 kHz or by 1 MHz steps. As the scan passes through any 500 kHz or 1 MHz point a tone will sound if the BEEP function is active.

1. Select the Main Band by pressing the VHF or UHF key twice. The purpose for pressing the band key twice is in the event you are in memory mode by mistake.

2. Press the SCN key for approximately 1 second and release the SCN key. Use the Main Tuning dial or UP ARROW or DOWN ARROW keys to scan in a particular direction.

3. Whether you are cycling upward or downward, during scan the decimal point will flash indicating that scanning has begun.

4. When a signal is received, scanning will stop and remain on that frequency. When channel goes quiet or Main Tuning Dial is rotated clockwise or counter clockwise, scanning will continue.

5. To cancel scanning press the SCN key.

All 3 scan types can be applied to Band Scan.

8.1.1 PROGRAM BAND SCAN MODE (VFO MODE)

This scan option allows the scanning of a range of VFO frequencies. Each band may have independent scan ranges. The lower band limit is programmed into Memory Channel 18. The upper band limit is programmed into Memory Channel 19. You may initiate Program Band Scan from either VFO or Memory mode.

EXAMPLE: STORING LOWER/UPPER RANGES

1. Select the Main Band by pressing the VHF or UHF key, for example VHF.

2. Enter a desired Lower Frequency via the key pad, for example "146.000".

3. Press the MR key.

4. Rotate the Main Tuning Dial until P1 is displayed.

5. Press and hold the FUNC key, then press the MW key to store the selected Lower Frequency into memory.

6. Enter a desired Upper Frequency via the key pad like 146.100.

7. Press the MR key.

8. Rotate the Main Tuning Dial until P2 is displayed.

9. Press and hold the FUNC key, then press the MW key to store the selected Upper Frequency into memory.

10. Press and hold the FUNC key, then press the SCN key. The letter P will begin to blink on the display. Scanning from 146.000 to 146.100 has begun.

11. Press the Main Band key as performed in step 1 to stop this function. Pressing the SCN key will also cease this function.

*** NOTE ***

The upper limit frequency and Lower limit frequency may be stored into either P1 or P2.

8.2 MEMORY SCAN MODE

This scan option allows the user to scan frequencies that have been programmed in any (or all) of the memory channels. Bands may be scanned individually or both bands may be scanned simultaneously.

1. Select the Main Band by pressing the VHF or UHF key twice. The purpose for pressing the band key twice is in the event you are in memory mode by mistake.

2. Press the MR key.

3. Press the SCN key. Use the Main Tuning dial to scan in a particular direction. You can also use the UP or DOWN ARROW keys to scan in a particular direction.

4. Whether you are cycling upward or downward, during scan the decimal point will flash indicating that scanning has begun.

5. When a signal is received, scanning will stop and remain on that frequency. When channel goes quiet or Main Tuning dial is rotated clockwise or counter clockwise, scanning will continue.

6. Press the Main Band key as performed in step 1 to stop this function. Pressing the SCN key will also cease this function.

8.2.1 MEMORY CHANNEL SKIP MODE

Memory Channel Skip permits unwanted memory channels to be skipped during memory scan. This step presumes that you have already programmed some/all memory channels.

1. Press the MR key.

2. Rotate the Main Tuning Dial until the memory channel that you want to skip is displayed.

3. Press the SKIP key. The decimal point will disappear from the frequency displayed, indicating this frequency will be skipped. Perform step 2 and 3 for each memory channel that you wish to skip.

4. To cancel Memory Channel Skip, press the SKIP key again. The decimal point will re-appear, and that memory channel will now be restored to scan status.

8.3 SCANNING TYPES

The DJ-580T/E offers 3 different scanning modes as shown below. The initial factory setting is the Busy Channel Scan.

Busy Scan - Stops at a busy channel or frequency until clear. Two seconds after the signal ceases, scanning resumes.

Timed Scan - Stops at busy channel or frequency, then resumes scan 5 seconds later even if the channel remains busy. Scanning will also resume when a signal received ceases.

Selecting a Scan Type:

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the TMS key. A black block with a white lettered T will appear, indicating to you that "Timed Scan" has been selected.

3. Press and hold the FUNC key, then press the TMS key again to leave "Timed Scan". The black block with a white lettered T will disappear from the LCD display.

The DJ-580 will be in "Busy Scan" when not in "Timed Scan".

8.4 OTHER SCANNING INFORMATION

This subsection talks about all other information pertinent to radio scan.

8.4.1 DUAL BAND SCAN

You may want to scan both bands at the same time. You can perform that function by following this example.

EXAMPLE: DUAL BAND SCAN

1. Press the VHF key.

2. Press the UP ARROW key for approx. 1 second.

3. Press the UHF key.

4. Press the UP ARROW key for approx. 1 second.

8.4.2 DUAL BAND SCANNING WITH MEMORY PRIORITY

If you want to activate PRIORITY on both bands while SCANNING, no problem, follow this example.

EXAMPLE: DUAL BAND SCAN WITH DUAL BAND PRIORITY

1. Press the VHF key.

2. Press the MR key and rotate Main Tuning dial for a desired memory channel.

3. Press the VHF key.

4. Press the SCN key for approx. 1 second.

5. Press the PRI key.

6. Press the UHF key.

7. Press the MR key and rotate Main Tuning dial for a desired memory channel.

8. Press the UHF key.

9. Press the SCN key for approx. 1 second.

10. Press the PRI key.

9 REPEATER OPERATIONS

Amateur radio repeaters utilize separate transmitter and receiver sections. The transmitter frequency may be offset either above or below the receive frequency according to repeater coordination conventions.

9.1 SPLIT FREQUENCY FUNCTION

When standard offsets will not satisfy an input or output frequency, a split is utilized for this purpose. Split can be configured on the DJ-580 for VFO and MEMORY modes. The split frequency function will not operate in CALL mode.

9.1.1 VFO MODE SPLIT

Perform the following for VFO MODE SPLIT.

1. Select the Main Band (VFO) by pressing the VHF or UHF key. Enter a frequency into the VFO for your output (receive) frequency.

2. Press the MR key. Program or select a frequency in any MEMORY channel for your input (transmit) frequency.

3. Enter VFO mode again. You are now in receive, while transmitting will divert to the MEMORY channel for the transmit frequency.

4. Press and hold the FUNC key, then press the SHIFT key repeatedly until the ~ appears on the display. The split setup is now complete.

9.1.2 MEMORY MODE SPLIT

Perform the following for MEMORY MODE SPLIT.

1. Press the MR key. Program or select a frequency in any MEMORY channel for your input (transmit) frequency.

2. Select the Main Band (VFO) by pressing the VHF or UHF key. Enter a frequency into a VFO for your output (receive) frequency.

3. Press the MR key again. You are now in receive, while transmitting will divert to the VFO frequency for the transmit frequency.

4. Press and hold the FUNC key, then press the SHIFT key repeatedly until the ~ appears on the display. The split setup is now complete.

9.2 REV KEY

In some areas there may be repeaters operating on repeater frequency pairs, the exact reverse of another repeater in the area. That is, the input of one repeater is the output frequency of the other and vice versa. To avoid the inconvenience of reprogramming every time both repeaters are in range, the REV key allows instant reversal of the input and output frequencies and the offset direction. The REV function is also useful to check the repeater input to determine if another station is heard directly so you can go simplex. To activate the REV function:

1. Press and hold the FUNC key, then press the REV key. The repeater input frequency and opposite SHIFT indicator will appear on the LCD display panel.

2. Press and hold the FUNC key, then press the REV key again to cancel the REV function.

9.3 RESETTING RADIO

*** NOTE ***

Resetting the radio will erase all user programmed information (frequencies,shifts,offsets etc.) Make sure that this information has been written down before proceeding.

1. Make sure radio is powered off.

2. Press and hold the FUNC key in while turning on the radio via the power knob. The LCD will display 145.00 (VHF) and 445.00 (UHF).

*** NOTE ***

If you were to hold the FUNC key in and not let it go while powering up the radio, all display segments will be shown.

9.4 CTCSS ENCODE/DECODE

CTCSS encoding allows you to select the proper tone frequency to open another operators radio receiver or repeater. CTCSS decoding enables another operator to select the tone your receiver requires enabling you to hear them. Unlike Code Squelch operation (Refer to section 11 for details), a specific tone frequency is used. Here's how to use CTCSS Encoding/Decoding.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the TONE key.

3. Rotate the Main Tuning dial to the desired tone.

4. When the tone has been selected enter the Main Band by pressing either the VHF or UHF key.

5. Press and hold the FUNC key, press the T.SQL key repeatedly. Tone settings will cycle each time the T.SQL key is pressed. It cycles as follows on the LCD display:

o The Tone Encoder is Enabled when the letter T is displayed on LCD.

o The Tone Decoder Squelch function is enabled when the letter T and SQL is displayed on the LCD. When this function is active, you would expect a particular tone to open your radio receiver.

o When the T and SQL is not displayed, the encoder/decoder is disabled.

EXAMPLE: TONE ENCODER/DECODER

Radio for Joe Radio for Linda
------------ ---------------
Tone set: 100.0 Tone set: 100.0
T displayed (ENCODE) T and SQL displayed (DECODE)

A) Radio operator "Joe" is calling "Linda". The interesting point here is that when the radio that Linda is using displays T and SQL, nothing will be heard through her radio speaker when squelch is opened up (fully counter clockwise). You will notice however that the S/RF indicator will be shown on the LCD when squelch is opened.

B) The only way that Linda will hear Joe is for Joe to send the proper tone to open Linda's radio receiver. If Joe doesn't send the right tone, Linda's radio will remain silent.

10 AUTOPATCH OPERATION (AUTOMATIC DIALER)

The DJ-580T/E offers three automatic dialer memories. A telephone number may be entered in either the VHF or the UHF frequency mode. The stored telephone number is transmitted on whichever band is selected as the Main Band.

10.1 PROGRAM AUTODIAL NUMBER

To enter a telephone number, perform the following:

1. Press and hold the FUNC key, then press the A key. The selected VFO frequency display will clear and display C1 or C2 or C3. Rotate the Main Tuning dial clockwise or counter-clockwise to obtain a desired dialer memory. The telephone symbol will display on the LCD and flash, indicating that the dialer memory is ready to accept the number to be stored. You may enter up to 16 numbers, letters and symbols, four at a time in four groups.

2. The telephone number or codes should be entered in order from the beginning. The following characters can be used:
0-9, A-D, *, #

3. Press and hold the FUNC key, then press the A key to store the entered telephone number or codes. The telephone symbol stops flashing and is on steady to show that this function is active.

Proceed to Section 10, 10.4 to transmit the dial sequence. Clear out dialer memory to enter a new sequence.

10.2 CLEAR DIALER MEMORY

1. Press and hold the FUNC key, then press the A key.

2. Rotate the Main Tuning dial to the dialer memory you wish to clear.

3. Press and hold the FUNC key, then press the C key followed by the A once again.

10.3 CORRECTING CODES IN DIALER MEMORY

1. Press and hold the FUNC key, then press the A key.

2. Rotate the Main Tuning dial to the dialer memory you wish to make a correction in.

3. Press and hold the FUNC key, then rotate the Main Tuning dial until the sequence of digits you wish to correct have just exited the display.

EXAMPLE: CORRECTING DIALER CODES

Programmed number is 123567890, but you forgot 4!

1. Press and hold the FUNC key, then press the A key.

2. Rotate the Main Tuning dial to the dialer memory you wish to make a correction in.

3. Press and hold the FUNC key, then rotate the Main Tuning until the numeral 3 is displayed.

This represents the last digit displayed on the LCD.
| These digits are hidden just right of last digit shown.
v vvvvvv
123 567890

4. Now enter 4567890. After you play with this for awhile you will see how it works.

10.4 TRANSMIT/CHANGE AUTODIAL NUMBER

After performing the steps in section 10.1, perform the following steps to transmit the programmed number.

1. Press and hold the FUNC key, then press the "A" key.

2. The telephone symbol could be blinking which represents an unprogrammed dialer memory channel. Refer to Section 10. Otherwise, rotate the main tuning knob to the desired dialer memory channel.

Verify that the blinking telephone symbol appears on the LCD display.

3. Press the PTT switch for an instant. This will return you to VFO mode.

4. To transmit dialer memory channel, Press and hold the PTT key.

** LOOK AT LCD DISPLAY **

You are now transmitting. The ON AIR symbol should display on the LCD display.

5. While transmitting press the FUNC key to send/transmit the autodial sequence.

** LISTEN **

The dialer sequence that you programmed earlier will be transmitted. You can hear the tones that are being sent through the DJ-580 speaker.

HIDDEN FUNCTIONALITY

This is where you will have to experiment a bit. You can change the dialer sequence timing. Refer to Section 10.7 for all of these new details.

10.5 MANUAL DIAL

In some instances you may want to dial a number manually. perform the following steps.

1. The telephone symbol should not appear on your display. If it does, press and hold the FUNC key, then press the A key, the C key and finally the A key again.

2. Press and hold the PTT key.

3. Now dial the number on your keypad as you would a telephone.

10.6 DISABLE AUTODIAL

Performing the following step will erase a stored number in the autodialer.

1. Press and hold the FUNC key, then press the A key, the C key and finally the A key again.

You can either clear the dialer channel or not press the FUNC key during a transmission.

10.7 DIALER RATE ADJUST

The following steps are used for changing the dialer and dsq tone rates.

1. Press and hold the FUNC key, then press the * key. The symbol FL will appear on the LCD display.

2. Press the following keys in sequence: #, 1, 2, 3. The LCD will display the letter C. If you repeat this step continiously the letters will change as follows: C,D,upside down A,H,0,1,2,3,4,5,6,7,8,9,A,B

Each of these indicators are associated with a different rate during transmission.

11 DIGITAL SQUELCH (DSQ)

DSQ stands for DTMF Squelch Control. DSQ is very versatile and will allow you to:

o Make a transmission that will specifically be heard by a particular group (of your choosing, by a code sequence).
o Place a private call to a selected person in a group.
o Call a single operator.
o Straight DSQ transmission

This feature is achieved by use of DTMF Tones that will either open (or keep closed) the DJ-580T/E. In this section you will learn how to transmit and receive the DSQ SCHEME! A radio must be DSQ compatible to take advantage of these features.

11.1 DSQ SCHEME

Before we get started let's look at the DSQ tone structure. Depending on the transmission type (Group, Private etc.), a particular tone sequence will be sent. The tone structure is broken down into the following areas:

o GROUP Code - 3 digit sequence
o OTHER'S Code - 3 digit sequence
o OWN Code - 3 digit sequence
o MISC Codes

The following explanation of each area will help you to fully understand how each is utilized.

3 DIGIT "GROUP" CODE

By programming a 3 digit group code your members of a group would receive a common transmission. Perhaps this group wouldn't want to hear a transmission meant for another group that has another 3 digit code sequence.

EXAMPLE: GROUP CODE

Lets say that you are helping the local police department find a missing child. They have split 10 radio operators into 2-five person teams. Let's call them team 1 and team 2.

Each member of team 1 has a radio with a group code of 111. Each member of team 2 has a radio with a group code of 222.

The police have just found evidence that the child is definitely located in team 2 territory. The central transmission point now needs to contact the members of team 1 and notify them that their search area must be changed. They will send out a 111 group code (tone sequence) to team 1. By virtue of the group code 111, all members of team 1 will hear the message and team 2 will hear nothing on their radios. A separate transmission to group 2 could be placed with specific updated information!

3 DIGIT "OTHER'S" CODE

This code is used as an identifier of another station. In other words, it is the other persons "own" code.

EXAMPLE: OTHERS CODE

Lets say that an individual in team 1 needs to be given some specific information. The receiving stations identifier is referred to as the other's code. We will send that person the information by virtue of their 3 digit "own" code. You must enter their "own" code into your "others" code field.

3 DIGIT "OWN" CODE

A transmitting station uses 3 digits as a personal identification number. A receiving station uses this code to identify who called them.

EXAMPLE: OWN CODE

Lets say that you will receive some specific information. The other person will need to know your "own" code before your radio will receive a private call. Your "own" code is also necessary, because the other person receiving your message will see your "own" code displayed on their radio LCD.

MISC CODES

16 numbers, letters and symbols can be used for coding. Here's what you can use; 0-9, A-D, * and #. An "H" will appear on the LCD when the * is entered and upside down A will appear when the # is entered. The # sign is used as a wild card. Refer to WILDCARD for more information.

11.2 PROGRAMMING ALL DSQ CODES

Place your radio in front of you. The following steps get your radio set for DSQ operation.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the B key. The LCD display will indicate A-000.

3. Enter 3 digits for the group that YOU want to call. In other words, a unique calling code for a specific group.

EXAMPLE: PROGRAM 1ST GROUP CODE

A-123

4. Rotate the Main Tuning dial clockwise until B-000 is displayed on the LCD.

5. Enter 3 digits for another group that YOU might call. This is an additional group calling code.

EXAMPLE: PROGRAM 2ND GROUP CODE

B-456

6. Rotate the Main Tuning dial clockwise until P-000 is displayed on the LCD.

7. Enter 3 digits for your "own" Personal code. This is your unique identification code.

EXAMPLE: PROGRAM YOUR OWN CODE

P-100

8. Rotate the Main Tuning dial clockwise until y-000 is displayed on the LCD.

9. And now you must select the "others" 3 digit code. This is the operator you're calling. Lets say you're calling operator 200, enter "200" on the keypad.

EXAMPLE: PROGRAM THE OTHERS CODE

y-200

10. Rotate the Main Tuning dial clockwise until nn-00 is displayed on the LCD.

11. Enter a two digit code that will become the Digital Signal Message.

EXAMPLE: DIGITAL SIGNAL MESSAGE

nn-07

12. Press the VHF or UHF key to end setup.

Only radios with DSQ functionality are capable of receiving and/or transmitting DSQ tasks. These tasks are described in the following sub-sections, have fun!

11.3 DSQ MODES

This section will address all functions of DSQ and describe how they should be used. Only through experimentation of DSQ will you get the hang of it. DSQ functionality comes in various flavors, and they are shown in the following table.

DSQ FUNCTION	LCD DISPLAY
Straight DSQ	D.SQ
Group Calling	G D.SQ
Private Calling In A Group	G P D.SQ
Private Call	P D.SQ

11.3.1 TRANSMITTING (CODE SQUELCH)

Coded Squelch is a unique 3 digit sequence, when sent to another unit configured only for D.SQ, will open the receiver for reception. It's always a good idea to have a cheat card that lists each units identifier (own code) and group codes.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the B key.

3. Rotate the Main Tuning dial and select either A- for GROUP A or B- for GROUP B. Each group should have a unique identifier code. If either GROUP A or B doesn't contain the desired 3 digit code, enter it in at this time via the keypad.

4. Return to the Main Band as selected in step 1.

5. Press the B key several times until "D.SQ" displays on the upper right-hand corner of the LCD.

6. When you press the PTT key, the Code Squelch is transmitted automatically. At the conclusion of the 3 digits being transmitted, the operators radio (who you are calling) receiver will accept your transmission.

11.3.2 RECEIVING (CODE SQUELCH)

If the received Code Squelch signal matches the set Code Squelch code, D.SQ will begin to flash on the LCD display. In addition, an audible alert will be heard through the speaker.

If the receiver is on receive mode by code squelch, it is possible to communicate within 1.5 seconds after a received signal is clipped.

11.3.3 TRANSMITTING (GROUP CALLING)

When you select this option, you will be able to contact many operators that collectively make up a group. If operators with compatible DSQ functionality are configured correctly, and all have the same group code programmed, their radios should open and receive your call. It's always a good idea to have a cheat card that lists each units identifier (own code) and group codes. Here's what you have to do.

1. Press the B key.

2. Rotate the Main Tuning dial and select either A- for GROUP A or B- for GROUP B. Each group should have a unique identifier code.

3. Press the B key several times until G D.SQ displays on the upper right-hand corner of the LCD.

4. When you press the PTT switch, the GROUP code selected will be transmitted to all units in the GROUP.

If you are using GROUP A in step 2 and wish to change to GROUP B, follow steps 1-4 again.

The following DSQ code is transmitted as shown:

(3 DIGIT GROUP CODE) * (3 DIGIT OWN CODE)

11.3.4 RECEIVING (GROUP CALLING)

To receive DSQ coded calls in GROUP CALLING, setup your radio for G DSQ as follows:

1. Press and hold the FUNC key, then press the B key until G DSQ appears on the LCD display.

When the received DSQ code matches the first 3 digits of your display (group code), the G DSQ indicator will begin to flash. If the BEEP is off, the squelch will open for as long as the calling operator is transmitting. If the BEEP is on, an audible beep will be emitted from the radio and the indicator will display which group is calling. Reset the display by pressing the Main Band key or PTT.

11.3.5 TRANSMITTING (PRIVATE CALLING IN A GROUP)

It's always a good idea to have a cheat card that lists
each units identifier (own code) and group codes.

1. Press the B key.

2. Rotate the Main Tuning dial and select either A- for
GROUP A or B- for GROUP B. Each group should have a
unique identifier code.

3. Press the B key several times until GPDSQ displays on
the upper right-hand corner of the LCD.

4. Press the PTT switch to transmit the DSQ code or press
the VFO key for the band you are working.

The following DSQ code is transmitted as shown:

(3 DIGIT GROUP CODE) (1 DIGIT OTHERS CODE) * (1 DIGIT OWN CODE)

11.3.6 RECEIVING (PRIVATE CALLING IN A GROUP)

To receive DSQ coded calls in PRIVATE CALL IN A GROUP,
setup your radio for GPDSQ as follows:

1. Press and hold the FUNC key, then press the B key until
GPD.SQ appears on the LCD display.

When the received DSQ code matches the first 3 digits of
your group and your own code, the DSQ GP indicator will
begin to flash. If the BEEP is off, the squelch will open
for as long as the calling operator is transmitting. If the
BEEP is on, an audible beep will be emitted from the radio
and the indicator will display which group is calling.
Reset the display by pressing the Main Band key or PTT.

11.3.7 TRANSMITTING (PRIVATE CALL)

This option would be used when someone is calling only you.
This is different from encode/decode because you determine
your own identification code and not a subaudible tone.
It's always a good idea to have a cheat card that lists
each units identifier (own code) and group codes.

1. Press the B key.

2. Press the B key several times until P D.SQ displays on
the upper right-hand corner of the LCD.

4. Press the PTT key to transmit the DSQ code or press the
VFO key for the band you are working.

The following DSQ code is transmitted as shown:

(3 DIGIT OTHERS CODE) * (3 DIGIT OWN CODE)

11.3.8 RECEIVING (PRIVATE CALL)

To receive DSQ coded calls in PRIVATE CALL, setup your radio for P D.SQ as follows:

1. Press and hold the FUNC key, then press the B key until P D.SQ appears on the LCD display.

11.4 ERROR CODE

When the "Other's" private code is not confirmed the LCD display will indicate "Er".

11.5 TIMING CONSIDERATIONS

On occasions you may find that the operation of DSQ through some older repeaters may be unpredictable. This occurs on initial transmit with your DJ-580. When you transmit, a time delay occurs before the repeater is fully transmitting. The DJ-580 will begin to transmit the DSQ tone sequence during the repeater transmit delay. The DJ-580 can delay 450 ms or 750 ms. In addition, the
| timing period for the tone burst sequence can be adjusted.
| Please refer to section 10.7 for more information.

It is possible to delay the time to transmit codes to about 750ms after the PTT key is pressed.

1. Press and hold the FUNC key, then press the * key. The LCD display will display FL.

2. Press and hold the FUNC key, then press the 4 key. The LCD display will display d-750 or d-450. Repeat this step until the desired selection is made.

3. Press and hold the FUNC key, then press the * key. Repeat this step until FL and PL is absent from the display.

11.6 DSQ WILDCARDS

The # symbol is a wildcard that may be substituted for any one digit,letter or symbols used in DSQ codes. When the # symbol is entered it appears on the LCD display as an upside down A. The wildcard allows for the combination of many groups. If the first or first and second digits of several group codes are the same, you can replace the second and third digits (or just third digit) with a # mark, and thus transmit to all those groups.

EXAMPLE: WILDCARDS

1. Enter the 2 meter frequency of 146.520.

2. Press and hold the FUNC key, then press the DSQS key. Select any code squelch memory channel.

3. Release the FUNC key now and select a 3 digit code squelch code using the keypad.

Example: Enter the 3 digit code 1#5.

4. Press the FUNC key to return the LCD display to operating frequency.

Example: Now you will see on the LCD display P45.52.

5. Press the D.SQL key repeatedly (2 times) until C appears in the 100 MHz digit location.

Example: C45.620

If the incoming coded calls are anyone with a group code as follows, the call will be received by your radio.

o 105 through 195
o 1A5 through 1D5
o 1*5
o 1#5

6. When you receive a call from another station, the C will flash on and off for as long as the other operator is transmitting. Your radio has already memorized who was calling you, so press the PTT switch and you will transmit to that station directly. When you have completed your QSO, enter the wildcard sequence again to open your radio to all other stations again.

11.7 DIGITAL SIGNAL MESSAGE

This function allows you to send or receive messages consisting of 2 digit codes.

11.7.1 TRANSMITTING DIGITAL SIGNAL MESSAGE

You can retain 1 signal message in the transmitter memory.

1. Press and hold the FUNC key, then press the B key.

2. Rotate the Main Tuning dial and select a message memory channel nn.

3. Enter a 2 digit message code. This is a code that has been predetermined and understood by the operating parties.

4. Press the VHF or UHF key to end setup.

5. Set the appropriate paging function (D.SQ, G D.SQ etc).

6. Press the PTT key to transmit the DSQ code. Continue to hold the PTT key and press the CALL key.

What the receiving operator will see on the display will be the unit number f the calling station followed by the 2 digit code. The following is the sequence sent:

(2 DIGIT SIGNAL MESSAGE)

11.7.2 RECEIVING DIGITAL SIGNAL MESSAGE

1. Set the appropriate paging function (D.SQ, G D.SQ etc).

2. When the appropriate codes are received, your receiver will open to hear the calling operator. When the digital signal message is sent shortly after the initial transmission, you will see on the LCD display the 3 digit calling station followed by a - and then the 2 digit digital signal message.

11.7.3 TRANSMITTING WITH DIGITAL SIGNAL DISPLAYED

While a digital signal message is displayed, press the PTT switch. Your signal will be transmitted back to the station calling by using the displayed DSQ settings. The frequency will return to your LCD display.

11.7.4 REVIEW DIGITAL SIGNAL MESSAGE MEMORY

You can store up to 3 previously received digital signal messages. The first two memories store the messages in received order. The third memory stores the latest message. These messages display the 3 digit calling station followed by the 2 digit message. Here's how to view digital signal message memory.

1. Press and hold the FUNC key, then press the MESS key. Select any code squelch memory channel. The latest message will be displayed on the LCD display.

2. Rotate the Main Tuning dial to review the previously sent messages in n1 through n2. You can also use the arrow keys to review these messages.

11.7.5 CLEARING MESSAGE MEMORY

If you find it necessary to clear out messages, proceed with the following steps.

1. Select the memory number and press the C key once to clear out that location.

12 CROSSBAND REPEATER

The DJ-580 is capable of crossband repeat. To simplify matters, it means that when you transmit on one band it is simultaneously heard on the other band. Ok you want to set up a crossband repeater I hear you say, right! Remember that this is not a repeater but a crossband repeater or

crossband link. Here are a few things to remember about crossband repeat:

1. When crossband repeat is active, you cannot change frequencies or utilize other functions with the exception of crossband deactivation.

2. Set squelch threshold before you activate crossband repeat.

3. No radio modification is necessary to activate this function.

4. This isn't a 100% duty cycle repeater. If the radio becomes extremly hot to the touch, the radio should be allowed a cool down time.

12.1 ACTIVATE CROSSBAND REPEATER

Here are the steps for crossband repeat.

1. Rotate the volume controls for the VHF and UHF bands fully counter-clockwise.

2. Press and hold the FUNC key, then press the FL key. The LCD should display FL.

3. Press each key once as follows: #, 5, 0 and 8. You should notice that the word oPEn displays on the LCD and the opposite band indicator will begin to blink.

4. Press the PTT switch and release it. The radio is now in crossband repeat. When a signal is received on one band, it will be retransmitted onto the other band.

12.2 DEACTIVATE CROSSBAND REPEATER

To return to original mode perform the following:

1. Press and hold the FUNC key, then you will press the FL/PL key 4 times. After you press it the first time the LCD will display CLoSE. This indicates to you that crossband repeat has been disabled. The other 3 times that you press the FL/PL key will turn off the FL and PL indicators.

13 FULL DUPLEX OPERATION

The principles of Full Duplex operation is very much like a telephone. The idea behind this is that when you are talking (let's say) on 2 meters you will hear the transmission from the other station on the 440 band. He will hear you on 2 meters.

YOUR STATION OTHER STATION

TRANSMIT ON 2 METERS ------>--------> -------> RECEIVE ON 2 METERS
RECEIVE ON 440 BAND <-----<--------<-------- TRANSMIT ON 440 BAND

13.1 ENABLE SPEAKER FULL-DUPLEX

Enabling the speaker will cause feedback unless an external earphone or headset is used.

1. Press and hold the FUNC key, then press the * key. The LCD should display FL.

2. Press and hold the FUNC key, then press the 5 key. The LCD should display Fd-on. Repeat this step until the field indicates Fd-on.

3. Press and hold the FUNC key, then press the FL/PL key repeatedly until the FL and PL indicators are absent from the LCD display.

13.2 DISABLE SPEAKER SEMI-DUPLEX

Perform the following steps:

1. Press and hold the FUNC key, then press the * key. The LCD should display FL.

2. Press and hold the FUNC key, then press the 5 key. The LCD should display Fd-oF. Repeat this step until the field indicates Fd-oF.

3. Press and hold the FUNC key, then press the FL/PL key repeatedly until the FL and PL indicators are absent from the LCD display.

14 AIRCRAFT MODIFICATION

The radio will have to be opened and modified to receive aircraft. This procedure isn't difficult if you take your time. If you are unsure of your ability to open and/or perform this mod, please find someone with this know how!

*** NOTE ***

Don't even think of performing this modification unless you have the right tools and temperment.

1. Turn the radio off and remove the battery pack.

2. CAREFULLY remove the 4 phillips screws on the bottom of the radio. These screws represent each corner of the bottom of the radio.

Front of Radio
+---------------------------------+
| * <- Remove these screws -> * |

```
| |
| * <- Remove these screws -> * |
+---------------------------------+
```

BOTTOM VIEW SHOWN

3. You are about to remove the battery connector plate. There are wires connected to this plate. When moving the plate out of the way, don't pull further then you have to in order to see into the bottom of the radio. Locate | a bright RED looped jumper wire. Remove or cut (tape exposed ends) this jumper. That's all there is folks!

4. Take your time and reassemble the radio. Make sure that during reassembly that you:

o Don't forget to place long tension arm (part of the battery connector plate) into the battery lock clip located on the same side of the radio as the PTT switch.

REMEMBER, be patient and take your time. Never force anything together! It came apart easily, it should go back together that way.

5. Reset the radio (Section 9.3) and enjoy a hot airband receiver. You will be able to enter a frequency range from 108-142.995. The receiver will actually begin to receive around 110 MHz.

```
| *** NOTE ***
|
| If you see a second decimal point blink in the frequency
| displayed, this means that the PLL circuitry isn't locked.
| Example: 108.0.0
| ^____ This decimal point will blink.
```

Gee! I hope that he is still in business. I just sent a big order with a checque. :) But more seriously, I have ordered twice this year and he has been reasonably prompt. Some time this year, around March or so, he moved from Wyoming to Logan, Utah.

Maybe, although that's an answer that is not very comforting! :=)

What you have is similar to the way TV antennas are normally connected,
so it must not be too bad. The best method is to run the coax down to
ground level and ground it right at the ground rod, before the coax
enters the house. With a long ground wire, the lightning has two
choices which way to go: Down the ground wire or down the coax shield.
Even if most of it goes to ground, there will still probably be a
large pulse down the coax shield. Lightning is unpredictable, and
as far as I know, there is no way to test an installation in advance.

I live in an area that rarely gets lightning storms, so I just grounded
the bottom of my tower and ran all the coaxes from the tower base into
the house. If I lived in a more lightning-prone area, I would mount
a thick metal plate on the house just above the foundation and run all
coaxes through bulkhead connectors mounted in the plate. The plate
would be grounded with a large-guage wire directly to a couple of
8-foot, copper-clad ground rods. To protect against differential-mode
pulses (on the center conductor), I would probably buy an antenna switch
with built-in lightning arrestor.

I download from FTP the program FAX40.ZIP to recieve fax, rtty, cw....
This program is perfect for wath I want to do but it has just a problem: it
is not in english and neither in french. I think it's Germand. Does has
somebody who have a english or french translation of this program or a
FTP site where I can find it.

Thanks 73

From: steve@carlyle.CArlyle.COM
Message-ID: <35148.steve@192.9.1.30>
Source record: 289576

On May 15, there was a posting by "auto-faq script" that listed
"informational files ... available via anonymous FTP ..."

The posting said "For those without FTP access ... there is an FTP mail
server at ftpmail@decwrl.dec.com. Send email to this address with the
word HELP for more info."

So I did that, and got back instructions. Following those instructions,
I sent a message to ftpmail@decwrl.dec.com to retrieve one of the files
as a test:

```
connect
get rfi_tips.ftp
quit
```

I got back a message saying "No such file or directory"

So I looked back at the original posting, and it also said "Questions to
bowen@cs.buffalo.edu."

So I sent a message to bowen@cs.buffalo.edu asking what I did wrong. He
sent back the following message: "I didn't post any article and I'm not
familiar with ftpmail@decwrl.dec.com. I've never even heard of it til
now ... I'd suggest looking up the original author of the article ..."

So here I am back to the list (assuming that "auto-faq script" can't
answer questions).

What did I do wrong??? (be kind ...) And can the posting be changed to
prevent others making the same mistake?

>Folks, we intentionally designed the entire radio to be as
>immune to intermod as is possible with an HT. To do this, we
>had to make the front end closed to anything but 2-meter.

I understand that it is impossible to modify the radio for weather, public service band, etc. But I have one question I haven't seen anyone ask:

How about MARS? The MARS (Military Afiliate Radio System) frequencies are just outside the ham bands. I can't believe the front end filters are so sharp that they pass 148.000 with no attenuation but completely filter out 148.020. Is it possible to modify the '202 for MARS?

>it be better to use a dipole or trappeeed dipole on the roof or
>does such a long wire have comarable performance ? How low in freq
>could I go with such an antenna with decent output ? I have a good
>little tuner for this use which has a long wire connection.

I have used such an antenna many times. It works great, especially when
you can get it up as high as 60 feet.

The one problem is "hot" grounds. With an end-fed wire, the return
current has to go somewhere -- usually where you least want it!
The solution is counterpoise wires: Make up a 1/4-wavelength wire
for each band in use. Connect each wire to the ground lug on your
antenna tuner. Where you run the counterpoise wires is not too
critical: The short ones I just ran around the baseboard of the room.
The long ones I ran out the window, down to the ground, and then
around the outside of the house, behind the bushes so they wouldn't
show.

By the way, a 100+ foot wire should work fine on all the ham bands,
160 meters and above.

I've read that the reason NiCads are used in aircraft is that they can
produce greater current than a lead-acid battery (of equivalent weight)
into a low-resistance load. This particularly matters when starting
turbine engines - apparently there is a certain RPM range in which
you have to start feeding fuel to a turbine engine to get it to light,
but there isn't much airflow at that point, and there is a danger of
damaging parts through overtemperature. The higher current output
of NiCads causes the starter motor to accelerate the turbine faster,
so it spends less time in the danger zone and gets into the cooler
operating region sooner. Since the cost of the battery is peanuts
compared to the cost of rebuilding a turbine engine, it's worth it.

However, I don't know how they handle parked-aircraft temperatures.
The battery *is* likely to be somewhere low on the aircraft.

2572. EMAIL To Paul Opitz Radio Shack

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-22 21:55:00 UTC
From: rpo@trsvax.tandy.com
Message-ID: <1787700003@trsvax>
Source record: 289507

My email is bouncing along today. Sorry to those who emailed me direct for not giving you a 'personal' reply. As soon as I figure out my email problem, I'll start replying privately. However, the questions were, for the most part, the same from everyone:

1) Who makes the HTX-202?

Yes, I know. No, I cannot tell you (and keep my job). However, the USA division of the manufacturer doesn't even know that they make the radio for us. You cannot get technical info from anyone but us. If I could answer your question (perhaps someday the policy will change) all it would gain anyone is the satisfaction of a 'curiosity itch.' No practical value.

2) Are there plans for a softcase?

Radio Shack stores can now order a softcase from our Consumer Mail Center. The CMC catalog number is T19-1120, and it costs about $10. (As with the HT, availability might be limited at first.) My experience is that you get a better response to this type of 'special request' if you talk only to the Manager or Ass't Manager, and specifically refer to this as a Consumer Mail item.

3) Do I know Paul Schreiber?

Only by name...have surely met him at some point in the last 10 1/2 years, but can't place the face right now. 'Infamous?' :^)

I think that this answers everyone. Again, sorry for the lack of a direct reply...

Paul Opitz, Radio Shack Publications N5TPQ

>now ... I'd suggest looking up the original author of the article ..."

>So here I am back to the list (assuming that "auto-faq script" can't
>answer questions).

Hi Steve,

The "auto-faq script" part concerns the Perl script that I use to post
my FAQ's. The poster is a real person (i.e. me). An E-mail reply to
the message would have been promptly mailed to Devon and me.

The help message for the decwrl.dec.com ftp mail server, which I have
read, pretty much explains that it goes out and ftp's files
from other sites. You have to use the CONNECT command to specify
another host. I've appended the help file to the end of this message to
illustrate.

I suppose I could rewrite my document, but as experience with FAQ
maintenance has shown, trying to explain in too great a detail makes the
document ungainly, starts to look like the "do not drive with
Sun-Shade(TM) in place, remove from windshield before engaging ignition"
variety of documentation, and some people (present company excepted, of
course :-) will *STILL* miss the boat.

This is the first time I've gotten any complaints or feedback about the index. If the rest of the "silent-majority" have strong feelings one way or the other, I suppose I could make the requested changes.

>>> $Id: help-text,v 1.2 1992/05/15 23:47:22 vixie Exp $
>>>
>>> commands are:

reply <MAILADDR> set reply addr, since headers are usually wrong
connect [HOST [USER [PASS]]] defaults to gatekeeper.dec.com, anonymous
ascii files grabbed are printable ascii
binary files grabbed are compressed or tar or both
chdir PLACE "get" and "ls" commands are relative to PLACE
(only one CHDIR per ftpmail session)
compress compress binaries using Lempel-Ziv encoding
compact compress binaries using Huffman encoding
uuencode binary files will be mailed in uuencode format
btoa binary files will be mailed in btoa format
chunksize SIZE split files into SIZE-byte chunks (def: 64000)
ls (or dir) PLACE short (long) directory listing
get FILE get a file and have it mailed to you
(max 10 GET's per ftpmail session)
quit terminate script, ignore rest of mail message
(use if you have a .signature or
are a VMSMAIL user)

>>> notes:

-> you must give a "connect" command, default host is
gatekeeper.dec.com, default user is anonymous, default
password is your mail address.

-> binary files will not be compressed unless 'compress' or 'compact'
command is given; use this if at all possible, it helps a lot.
note that many files are already compressed.

-> binary files will always be formatted into printable ASCII
with "btoa" or "uuencode" (default is "btoa").

-> all retrieved files will be split into chunks and mailed. the
size of the chunk is 64000 characters unless you change it with
the "chunksize" command. CompuServe users will need to set this
to 49000.

-> VMS/DOS/Mac versions of uudecode, atob, compress and compact
are available, ask your LOCAL wizard about them if you can't
locate them (but try gatekeeper.dec.com in /archive/pub/VMS
if you're still using a VMS system.)

-> several mail unsplitters are hiding on gatekeeper.dec.com in
/pub/mail/ua/misc/unsplit. includes one in c, one in perl,
```

and one in VMS DCL.

>>> examples:

-> connect to gatekeeper.dec.com and get a root directory listing:
connect
ls
quit

-> connect to gatekeeper.dec.com and get the README.ftp file:
connect
get README.ftp
quit

-> connect to gatekeeper.dec.com and get the gnuemacs sources:
connect

^^^^^^^^^^^^^
I believe that this should have been "velocities" -------------^

The Doppler shift for freeway speeds at 2 meters is around 30 Hz; the
Doppler shift will change very rapidly as the path changes due to hills,
signs, buildings, etc. You could be looking at dF/dT of about 1 kHz/sec
or more.

If you are using CTCSS (as many amateur and commercial users are) then
you need to hold the demodulation accuracy to roughly 1 Hz.

And let's not forget the impulse noise cancellation benefit associated
with FM.

> MATT tna@mentor.cc.purdue.edu

This is not a solution, but I can share some light in my experience.
When I used to live in Hong Kong, my friend modified a handheld amateur-radio
transceiver for me (a Kenwood TH-21AT walkie-talkie), it originally had
only a red LED for transmit, but he added a dual color LED to get green
light when squelch is open (audio is coming out). There are two types of
dual color LED: common anode, and common cathode. At that time, about
9 years ago, the rectangle version is but the wrong type for my radio, so
he bought a round one, and file it to a rectangle shape, with a file!
He did some other frequency expansion mod for me also.

[A side note: when I went back to Hong Kong this February, I was told by
some friend that he was murdered two years ago, I was too busy to find
some of our other friends to find out the whole story, but this posting
has triggered me to pay tribute to him, as a friend, and his contribution
to the radio/electronics/computer/RC-modelling hobby circle. I wish he
he passed the last part of the amateur-radio exam, before he passed away,
which he wanted so much (majority of difficulty was only barrier in the
English language: which the exam in only avail. in)]

now, back to the normal traffic here.

Apparently the original article must have had some problem propogating.
I know I never saw it, though I cannot rule out just missing it in the
menu. However the large number of posted responses seem to suggest that
the original article must have hit the ground at some backbone site or
the gateway between the digest mailing list and USENET (I'm reading from
USENET).

Actually the current capacity is about the same. However NiCads can
sustain that high current level for a longer period of time and not
as likely be damaged as a lead-acid.

>into a low-resistance load. This particularly matters when starting

Just how long does the aircraft need that high current to roll the
turbine out of the danger zone?

Source record: 289519

In rec.radio.amateur.misc, benjamin@ee.tut.fi (Gr|nlund Pentti) writes:

BTW. I wonder where the original poster did get his information. I have
yet to see a -6dB cellphone antenna. On 2m and 70 cm yes (most rubber loads
are even worse) but on 800 MHz (or 900 MHz here in Europe) even the
shortest stubs in portable phones are at least quarterwave.

I got that information from three cell phone dealers in northern Colorado.
But I've thought of calling the manufacturers and asking them; they may know
more than dealers and techs working at dealer service shops. I'm beginning
to think that some dealers don't know too much about their products. But
then that's true of a lot of businesses.

BTW, thanks to all who have responded; both email and direct. I've got a much
better handle on the cell phone antenna situation.

Msgid : $RACESBUL.223

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.223 DATE: May 25, 1992
CATEGORY: MGT
SUBJECT: Skill categories for communications volunteers

First comes the management category: that of your Radio Officer, the assistant Radio Officers, shift supervisors, and administrative people of any level or skill.
Then there is the technical group, such as installers, maintenance, engineers, consultants, technicians, who range from advice to hands-on work.
Most importantly, there is the operations group: those who actually operate the equipment. Not all operators operate all equipment. Some have highly specialized skills. Operating VHF and HF radios are quite different and utilize varying skills and experience. An excellent VHF Net Control Operator may not grasp the subtle, but critical, nuances of HF nets. A digital communications operator may have little or no voice operations experience. Obviously, not all volunteers can do the same thing, nor should they. The "cookie cutter syndrome" has killed more than one organization, so don't let it do that to you. Recognize and utilize the unique interests and talents of the volunteers. Don't expect all of them to possess the same skills or the same interests. That's why it is important to staff the three major levels: management, technical and operations.

2598. Antennas vs homeowner covenants

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-23 17:31:43 UTC
From: johnp@hpgrla.gr.hp.com
Message-ID: <14780002@hpgrla.gr.hp.com>
Source record: 289289

My neighborhood's covenants and restrictions prohibit all outdoor antennas and masts. I can live with that, at least I don't have to look at a bunch of satellite TV dishes.

But since there is no cable TV service here, several of the homeowners want to amend the covenants to specifically allow satellite TV dishes. Someday I would like to become an amateur operator, so I want to make sure that the definitions are general enough to allow other types of antennas, yet not arouse fears in other homeowners of towering masts or bristling antenna "farms".

I'm not real familiar with the antenna types commonly used by amateurs today. So I'm asking the net for help in drafting an amendment that would allow useful external antenna types, yet would not impact residential aesthetics any more than would a typical TV dish. I'm sure some of you live in snooty developments and have been through this before.

Thanks for any suggestions,

John Parsons johnp@hpgrla.gr.hp.com

2599. Wanted: Utility line voltage cooling thermostat (keep my rigs cool)

Newsgroup: rec.radio.amateur.misc

>>moving around very fast. This is unlikely under under normal scenerios
>>with xtal references for sythesizers and normal vehicle accelerations.
> ^^^^^^^^^^^^^
>I believe that this should have been "velocities" -------------^

No, the original was right...

A relative velocity between transmitter and receiver merely
produces a constant doppler shift which appears as a fixed frequency
offset - delay between a pilot IF channel and an information IF channel has
no effect on such a shifted signal as the pilot frequency remains
constant and pilot signal microseconds or milliseconds earlier (e.g. as with
real high group delay narrow band filters) will still be in the correct
frequency relationship to the presumably less delayed information
sidebands because the pilot frequency is not changing.

Relative acceleration, on the other hand, produces changes in
the pilot (and effective carrier) frequencies. If the pilot IF channel
delays the pilot relative to the information there will be an instantanteous
frequency error between the older pilot and newer information that can produce
garbled information when the old pilot is used as a reference for detection.

>
>The Doppler shift for freeway speeds at 2 meters is around 30 Hz; the
>Doppler shift will change very rapidly as the path changes due to hills,
>signs, buildings, etc. You could be looking at dF/dT of about 1 kHz/sec
>or more.

Gary Coffman also made the same point about the phase
instability (incoherence) of mobile paths due to multipath. This may be
a problem for effective ACSSB systems, especially those that depend
on PLL recovery of the pilot tone.

This would tend to make me think that recovering pilot with a
moderately narrow band (gaussian) filter and a hard limiter with gross
frequency errors taken care of with some kind of frequency locked loop
would be superior to using a PLL. The hard limiter would allow rapid
(as determined by the bandpass of the filter) phase jumps, which narrow
band PLL's tend to be allergic to.

I am sure the dynamics of pilot recovery in a mobile environment would introduce certain distortions into the recovered signal - but as we all know, so does multipath for FM. Without some attempt at measurement or simulation it is hard to be sure apriori that this distortion is going to be perceived as worse than the various pops and distorted sylables that FM sometimes experiances. I have no particular involvement with ACSSB so I have not had experiance with the results in practice - there are computer programs that will simulate a mobile path (and at least one DSP based commercial instrument that will do this to actual IF frequency signals - HP makes it I believe) so it ought to be possible to completely simulate the environment and see... In the end, however, assessing the impact is a problem in psychoacoustics and human factors analysis and whether a particular distortion is bad or not has to be decided by listeners and speaker articulation testing and not by speculation based on what it might do to the waveform of the audio.

>
>If you are using CTCSS (as many amateur and commercial users are) then
>you need to hold the demodulation accuracy to roughly 1 Hz.
>
This is true for the long term frequency error. However most CTCSS detectors use long integration times and would not be sensitive to short term frequency errors. It is true that an ACSSB system that produced picket fence phase jumps in the phase of the CTCSS tone might not work as well as an FM system that merely corrupted the audio with wideband click noise or distortion due to mangled sideband phase depending on the detector used for the CTCSS tones.

>And let's not forget the impulse noise cancellation benefit associated
>with FM.

There is no question about this, though there are noise limiter and blanker techniques that would help ACSSB considerably.

2607. HELP! MISSING PERSON

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-24 07:51:07 UTC
From: djk@TASP.NET
Message-ID: <777zYkB7TASPz@TASP.NET>
Source record: 289380

Hi:

This certainly does not have too much to do with ham radio... But I am a ham.. So.....

I certainly can use a hand with some of your prayers - and a little bit from some open and observant eyes as well!

My wife has been missing since 5/4/92 somewhere in the USA - and I do not know where she is or how she is doing.

She is 5' 7" about 175 lbs, dark brown hair, brown eyes, and normally dresses kind of 'New Englandish'. Her name is Anne Louise Velesta Karnes, and she may also be going as Anne Karnes, or Velesta Karnes. Velesta does wear glasses. She is 34 years old.

She would be driving a 1987 Chevy Malibu wagon with a New Hampshire plate of ADH479. (I think!) The car has dark gray sides with light gray top and hood and has a luggage rack.

She is fond of arts and crafts and things like that and has a large authentic spinning wheel with her in the car and may be visiting arts and crafts or textiles demos and fairs etc.

Possible destinations include Boxford Mass. (vicinity of 6 Valley road or RTE 133 near the 95), Anchorage Alaska, Upstate NY, Northern Cal, Denver CO, Nashville TN or ?

She disappeared after some bad news from the family, and an argument with her husband (me) and since her disappearance, no-one has seen her. A lot of people are very concerned, most of all myself.

I would appreciate having this message propagated as far and as wide as possible via the radio, postings - whatever.

If she is seen, please ask her to call her husband or family, and PLEASE let me know where she is.

PLEASE tell her that I love her dearly.

I can be reached here at this email address or preferably at:

(714)734-9487 24 hrs. Please call collect if you have information.

-djk

Please forgive this odd use of the net, but I am frantic and trying all available resources.

John,
A thermostat that would prevent overheating usually is not found as
part of a home-improvement idea. Most thermostats, if not all, are to
prevent underheating. The options you have, as I see them are:

1) Obtain a heating/cooling thermostat. Most of these operate in the
30 volt range, and you can use a spare 24-30v relay to operate your
fan(s). The heating portion would not be used.

2) Obtain a thermostat, schmitt trigger, FET, and relay, and build your
own. This is about the only way to get a small, reliable unit, which
could then be fitted into a plug-in type unit of your choice.

3) Obtain a heating thermostat and power a relay with it. When your
equipment gets too hot, the thermostat shuts off, CLOSING the relay
contacts and powering the fans.

4) Radio Shack offers a panel-mount digital thermometer which can be
configured as a thermal-controlled switch. I don't remember the price of
this unit, but if your station ends up in a luggable box, this might be a
nice addition to your array of panel meters. It is apparently able to
close a contact (unknown specs) at whatever temperature you designate,
and should be selecatable for cooling or heating.

Just my $1.50 worth of $.02 gathering dust.

>clubs? It's available via the Bitnet listserv network. Send me E-mail
>if you need assistance. The mailing list has about 100 subscribers from
>all over the world.

Whoops, looks like I spoke a little too soon! As it turns out, the host school for the mailing list (University of Illinois at Urbana-Champlaign) is cleaning up its listservs, due to labor and disk-space burdens. Prime targets for removal are lists that are primarily of off-campus interest (only 1 out of 179 subscribers is a UIUC'er), have no sponsor (KA9WGN left a while ago), and are excessive burdens (the ham-univ mailing list, unfortunately, has a lot of problems with bounced mail and obsolete accounts because people don't properly sign off). As a result, Ham-Univ is going QRT in about 3-4 weeks.

With the administrative burdens of maintaining such a list fully in mind, would anyone be interested in taking it over, either as a Bitnet Listserv or an Internet mail-reflector? Interested parties are encouraged to contact the UIUC postmaster responsible for the list, Mark Zinzow, at markz@vmd.cso.uiuc.edu. He would be more than happy to provide technical assistance in moving the list and the message archives to your site.

To: alanb@hpnmdla.sr.hp.com (Alan Bloom)

AB:)The one problem is "hot" grounds. With an end-fed wire, the return
:)current has to go somewhere -- usually where you least want it!
:)The solution is counterpoise wires: Make up a 1/4-wavelength wire
:)for each band in use. Connect each wire to the ground lug on your
:)antenna tuner. Where you run the counterpoise wires is not too
:)critical: The short ones I just ran around the baseboard of the room.
:)The long ones I ran out the window, down to the ground, and then
:)around the outside of the house, behind the bushes so they wouldn't
:)show.

AB:)By the way, a 100+ foot wire should work fine on all the ham bands,
:)160 meters and above.

AB:)AL N1AL

Curious Al, if you can get out the window and around the bushes, why not
just pound a 8 foot grounding rod into the ground outside your window
and run one ground wire attached to your tuner to the ground rod
outside? I would think it would be a lot less noticable. 8-)

Are you comparing two batteries of equal amp-hour capacity, or equal
weight?

>>The higher current output
>>of NiCads causes the starter motor to accelerate the turbine faster,
>>so it spends less time in the danger zone and gets into the cooler
>>operating region sooner. Since the cost of the battery is peanuts
>>compared to the cost of rebuilding a turbine engine, it's worth it.
>
>Just how long does the aircraft need that high current to roll the
>turbine out of the danger zone?

I've never started a turbine engine, so I don't know. My guess
would be something in the 5-10 second range. However, it's not like
starting a piston engine, where heavy currents are needed for only
a few seconds to turn the engine over. A turbine draws lots of
current for a while (maybe 30 seconds) before it gets up to the speed
where the fuel can be turned on, and the battery has to keep accelerating
the engine until the RPM (and airflow) reaches the point that the
engine is self-powering. Then, on multi-engine airplanes, the
running engine is used to recharge the battery for a couple of
minutes, before the combination of battery plus running generator
are used to start the other engine.

So a turbine starter battery may be called on to deliver a sizeable
fraction of its charge in a period of 1 minute or so, then accept
charge at a high rate, then be discharged again, all in the space
of a few minutes.

RTTY DX Notes 17 April
RTTY DX notes for week ending 17 April, 1992 (BID RTDX0417)

This weekend is the 2nd SARTG AMTOR DX contest. We expect lots of
AMTOR on the bands and we wish everyone lots contacts. Don't forget
to call in FEC and pass your message on ARQ. Bands 3.5, 7, 14, 21 and
28 MHz. Time 0000-0800 UTC, 18th April, 1600-2400 UTC 18th April, and
0800-1600 UTC 19th April. Exchange RST, Name and QSO number.

Our thanks this week go to I5ICY, I5IGQ, TG9VT, VK2SG, VK2EG, W2JGR
and the Twin Cities DX Packet Cluster network, WB2CJL, N5PSI, UT5RP,
DJ3IW and the DB0SPC Central Europe DX Packet Cluster. Thank you all
for your assistance in putting these notes together.

Notes of interest:

Bangladesh (S2). With great surprise S2/HA5BUS showed up on RTTY doing a marvelous job on the air. The operator Imi (HA5HO) is transmitting from Dhaka and states they will be active till April 21 or 22nd. We all hope the DXAC Desk will accept this operation as done earlier for EP/HA5BUS . QSL goes to GLOBEX Foundation, Box 49, 1131 Budapest, Hungary. Their next stop will be Malaysia.

N5PSI, Mike, informs us that he became the QSL manager for 5N3ZIP. Prior to this, the Nigeria station didn't have a QSL route or QSL's. Mike will attempt to get past logs for contacts prior to April 92'. N5PSI is good in 91' and 92 callbooks. Pse QSL direct only.

ST. Kitts (V44). A Japanese group plans to be active from this Island from April 29th til May 3rd on CW, SSB and RTTY.

>From Friday April 24th Syd, (VK2SG) will take back the notes. Many people, TG9VT among others, will be in Dayton and for that he cannot distribute as normal the notes. So those interested must pick it up themselves from TG9VT APlink. VK2SG will see that it is in TG9VT box. Be welcome and the next week everything be normalized.

Thank you all for the help during Syd's absence and let me end by wishing the readers, Happy Easter.

SB SAT @ AMSAT $ANS-144.01
DOVE TESTING PRODUCES WORDS!

HR AMSAT NEWS SERVICE BULLETIN 144.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 23, 1992 BID:$ANS-144.01
TO ALL RADIO AMATEURS BT

DOVE (DO-17) Speech Testing Reaches Milestone

DOVE is currently on 2M and is running a small engineering test of the
speech module. This is DOVE's first voice from space.

The purpose of this test is to exercise the control and data lines of the
DOVE module. The actual speech was kept as simple as possible, it is un-
inflected speech from the phoneme generator - "You are listening to DOVE
Microsat." Three minutes of 1200 bps telemetry alternates with one minute
of voice. MUCH BETTER SPEECH IS EXPECTED ONCE THE FINAL CHECK-OUT'S ARE
COMPLETED.

This test is just part of a recent intensive period of engineering activity
on DOVE, designed to find the cause of the control difficulties and to for-
mulate a viable work around. This activity will continue, the current test
is just the first milestone. The DOVE recovery team currently consists of
Bob McGwier (N4HY), Harold Price (NK6K), Jim White (WD0E), and the satel-
lite's owner, Junior Torres de Castro, (PY2BJO). The first DOVE voice from
space began at approximately 05:15 UTC 24 MAY 92, while N4HY, NK6K, and
WD0E were engaged in a conference call.

According to NK6K: "We don't think we have all the answers yet, and much
remains to be done on DOVE before it is ready for its intended educational
mission. DOVE may leave two meters from time to time as we continue the
check-out process."

[The AMSAT News Service (ANS) would like to thank Harold Price (NK6K) for
the information which went into this bulletin item.]

AMSAT-NA "Address Book" Avilable For The Asking

In last week's AMSAT News Service (ANS) bulletin, ANS-137.01, Tom Clark's INTERNET address was erroneously given as the place to request the AMSAT "address book." The correct address to send your request to is to: listserv@amsat.org or to kb5mu@amsat.org. You will receive a list of almost 300 calls that can be reached via INTERNET or CompuSeve Information Service (CIS). Also, there is a list of the current "special interests groups" within the AMSAT "address book" of groups that perform a variety of functions from AMSAT Area Coordinators to those that generate keplerian elements. You can sign up to receive timely information from any of these groups by requesting that your CIS or INTERNET address be added to the list. The AMSAT Board-of-Directors (BOD) hopes that his new INTERNET utilization will allow even greater disemenation of news concerning OSCAR satellites.

For those who are on CompuServe and have never sent a message to a anyone on INTERNET, it is quite easy. To request your list, send your request either to Paul Williamson (KB5MU) or to listserv@amsat.org. When you compose your "mail" message on CompuServe and it "prompts" you for the address, in the case of Paul Williamson (KB5MU) for example, you would type his INTERNET address as follows:

>INTERNET:kb5mu@amsat.org (NOTE the UPPER & lower case letters
or and the ">" symbol)
>INTERNET:listserv@amst.org

and on if you are on INTERNET and you want to send Paul a message, you address it to him by typing: kb5mu@amsat.org.

DB20S Provides Good News About AO-21/RUDAK Status

The "RESET" procedure performed by the Ground Command station in coordination with AMSAT-U was successful and the AO-21/RUDAK Beacon returned again to operation. Gerhard (DG2CV) reloaded the RUDAK software, which includes the "watch-and-bite" routines to avoid self-switching of the beacon modes. If all goes well, RUDAK will operate for the next few days according to the following message. There will be no commanding from Sunday May 24 to Friday May 29, since all AMSAT-DL team members will be at the P3D Design Meeting in Marburg, Germany. Please send any reports terrestrially to:

DB2OS @DB0FAU.DEU.EU
DG2CV @DK0MWX.DEU.EU

or to DB2OS,DG2CV via UO-22 after Thursday May28.

73s de Peter DB2OS

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 144.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 23, 1992 BID:$ANS-144.04
TO ALL RADIO AMATEURS BT

AO-13 ZRO Test Schedule: May 1992

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a new schedule for May, 1992, via AO-13. This activity is a test of operating skill and equipment performance.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero." The control operator will send and repeat a random five-digit number, then lower the uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine").

A participating listener monitors the downlink signals until they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve home-station performance to a point where the lower-level downlink signals can be copied (levels 6 through 9).

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can

be heard on 145.840 MHz and the "JL" test on 435.945 MHz. Ed (N5EM) will run the "JL" tests while Andy (WA5ZIB) will continue with "B" runs.

Saturday May 30, 1992 at 1745 UTC "B"
Saturday May 30, 1992 at 2000 UTC "JL"

Note that the dates and days are shown in "UTC." Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure characterizes test procedures, means for obtaining certificates and gives some historical background about the program. A few certificate requests from the previous round of ZRO tests are still pending but should be shipped by May 9th.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception.

AO-13 Operations Jun-Dec
SB AMSAT @ WWW < G3RUH $A920508

Calendar of events for Oscar-13 to the end of 1992

Suns Position
Date Event Modes Sun Angle SEL/SAZ

1992 Jun 08 [Mon] Move to 210/0 B JL S 5 -24/126
1992 Jun 29 [Mon] L OFF B -- - 4 -33/149
1992 Jul 20 [Mon] Move to 150/0* B -- - 3 to 44 -34/176
1992 Aug 17 [Mon] L ON B JL S 28 -26/208
1992 Sep 21 [Mon] Move to 180/0 B JL S -1 to 29 -2/241
1992 Nov 23 [Mon] Move to 210/0 B JL S -29 to -4 33/305
1992 Dec 14 [Mon] L OFF B -- - -27 33/333
1992 Dec 28 [Mon] t.b.a. 43 29/351

Notes:
1. * via Alon/Alat 180/15; expect poor performance for a few days.
2. Illumination = 100*Cos(Sun_Angle) % and needs to be better than
70%, i.e. Sun angle within +/- 45 deg.

3. SEL/SAZ is Sun's position in orbit plane (like ALAT/ALON). Move on
Jul 20 to 150/0 is because Sun is at SAZ=176 i.e. apogee direction
so the antennas cannot point there as the solar panels would not
be illuminated. The Sun then gradually moves to SAZ around 208 so
we cannot use attitude 210/0 as has been customary.

AO-13 Transponder Schedule Jun 10 - Jul 20

Mode-B : MA 000 to MA 165 ! Mode-JL on Mon, Wed
Mode-JL : MA 165 to MA 200 ! Fri and Sat UTC.
Mode-LS : MA 200 to MA 215 ! S Beacon on "L" days

Mode-B : MA 215 to MA 256 ! S Transp on "B" days
Omnis : MA 250 to MA 060 ! ALON/ALAT 210/0

Mode L OFF after Jun 29 until Aug 17. Next attitude change Jul 20,
to 150/0 until Sep 21.

Note that modes will only change at the above MAs. So if Mode-L has
hung over through midnight utc into a non-L day, it will switch off
at any subsequent scheduled MA change point.

Similarly if midnight UTC begins a Mode-L day, the L transponder will
switch on at any subsequent scheduled MA change point, if appropriate.

INFORMATION

Don't rely on gossip and rumour! Up to date information about AO-13
operations is always available on the beacons, 145.812 MHz or 435.658 MHz
in CW, RTTY and 400 bps PSK. The active command stations are listed
below, and constructive feedback about operations is always welcome.

AO-16 EXPERIMENTER'S DAY

HR AMSAT NEWS SERVICE BULLETIN 144.07 FROM AMSAT HQ
SILVER SPRING, MD MAY 22, 1992 BID:$ANS-144.07
TO ALL RADIO AMATEURS BT

AO-16 Experimenter's Day Schedule

The AO-16 Command Team has announced the following PACSAT Experimenter's
Day schedule for April and May:

DATE START TIME END TIME MODE

27 May 0625 UTC - 27 May 0600 UTC - 28 May RCO

RCO: Raised Cosine Only, No S-Band.

QRP operations are encouraged on Experimenter's Day. Uplink power should
be limited to 20 watts EIRP. If you are using your AO-10/13 beams, this
means you must crank your power back to about as low as it will probably
go, no more than 2 watts. And don't forget to turn off your amplifier!

While Experimenter's Day operations are scheduled to be conducted weekly,
users are reminded that these operations may be shortened or canceled to
allow uploading of improved spacecraft software. Watch for bulletins on
the AO-16 BBS and/or the telemetry text frame for changes to the schedule.

[ANS thanks Bruce Rahn (WB9ANQ) for this bulletin item.]

ddodell@stjhmc.fidonet.org (David Dodell) writes:
: I have just purchased the TM741 TriBand radio. Need the following mods:
...
: (2) How to get radio to extend receiver / transmit ... need to move it to some

Be careful about doing the Kenwood recommended mod. I did it to a TM741
and the 440 receiver became unusable. It was being "desensed" by an FM
broadcast station. Two other TM741's around here behaved the same way
after the modification. The dealer replaced the control heads with
unmodified ones, but Kenwood has not told the dealer how to get the
extended frequencies without the overload problem.

Also I have found the aircraft frequency reception to be very very poor.
The receiver overloads on strong signals and can't hear weak signals.
The Alinco 580 handy-talky is very good at receiving strong and weak
aircraft band signals.

Several users of the local repeater have complained that their Kenwood
TM741's have frequency stability problems on 440MHZ. Please send me
any info about your experiences, good or bad, with the Kenwood.

I am ready to buy two more VHF/UHF rigs. Unless Kenwood will fix the
problems with the TM741, those rigs will not be Kenwoods. I am strongly
considering selling mine and buying three of the Alinco 599. If the
599 is as good a mobile rig as the 580 is a talkie, I would be very
pleased. The Kenwood TM741 is a disappointment and according to the
dealer Kenwood will do nothing to fix the deficiencies of the TM741.

2631. Re: Aircraft batteries

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-25 03:48:18 UTC
From: brian@ucsd.edu
Message-ID: <vpo22INN7rp@network.ucsd.edu>
Source record: 289414

The only turbine-start system I've ever studied used an APU (Auxiliary Power Unit) to generate compressed air to start the main engines. After one main was turning over, the compressed air it produced was used (along with APU air) to start subsequent turbines.

Is it no longer done this way?
- Brian

2632. nicads and turbines

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-25 04:49:05 UTC
From: kfeeney@helios.TN.CORNELL.EDU
Message-ID: <9205250448.AA01744@helios.TN.CORNELL.EDU>
Source record: 289406

Someone asked how long the nicads had to deliver power to the turbine engine during startup. I earned the procedure once on a Beech 18 with twin garrets. Start the engine spooling, which draws about 800 amps from the battery. After it hits 12-15 percent of N1 speed (several thousand RPM) you turn on the igniters and fuel. If all goes well, the RPM's start to climb quickly, along with the Exhaust Gas Temperature (EGT) and the battery comes off line. Call it about 30 seconds. Then you charge the battery at 100-150 amps for a minute and repeat for number 2, but of course you have the help of the running engine's generator.

If things don't go well, you can get what is called a 'hot start'. In that case the fuel doesn't burn properly in the airflow, and things get hot in the wrong places, and you don't get any RPM's. When that happens you have to chop the fuel flow, but keep the engine spinning on batteries to 'blow out' the combustion that is occuring.

There is a limit to how much you can get out of the batteries. If you pull too much current too long, their internal resistance goes down from the heat and you can get thermal runaway in the battery. This is a bad thing. A helicopter crew chief friend has seen the results when a set of nicads were run for 90 seconds, 30 more than the max they were rated for. It blew a hole out the front of the helicopter nosepiece where they were housed.

The Nicads are usually mounted low in the aircraft, sometimes have their own cooling, and some are on removable trays to facilitate getting a set swapped in when you've had a hot start or whatever. Whenever possible it's desirable to use an external start cart to supply the power. This is also why the turbine commuters often don't shut off the outboard engine while taking on or discharging passengers. (also each start/stop cycle costs engine life)

Nicads can dump a lot of juice in a hurry. You can get a peak current of about 50 amps momentarily from a set of 500 ma nicads. I've used it to start a fire by turning a wire (twist tie from a sandwich bag) red hot when stuck in the wods once.

More than you wanted to know about nicads :-)

ARLB043 FCC grants K3VOA

The FCC has granted the Voice of America Amateur Radio Club station
in Washington, D.C. the call sign K3VOA. Although specific call
signs for amateur stations have not been available for more than a
decade (FCC RULE 97.17 F), FCC Chairman Alfred Sikes made an
exception for the Voice of America Club in this, the 50th
anniversary year of the VOA. The license was issued May 7, replacing
K3EKA as the club's call sign.

In granting the special request, Sikes noted that several other
countries, including Belize and the Philippines, have granted
special VOA-suffix call signs to amateur club stations connected
with VOA transmitter sites. The club had lobbied for the call for
more than a decade.

Andy Anderson, K0NL, died May 4, 1992 at age 82. He was a former
ARRL Midwest Division Vice Director and Director and was a Director
of the ARRL Foundation. He was the founder of auto-call, a
publication bringing together many radio clubs in the Washington
D.C. area, and he was associated with the Bulletin of the Amateur
Radio News Service for more than 20 years.

After World War 2 he worked for the U.S. Department of State and the
Naval Reserves in Washington, D.C. During that time he formed the
Maritime Mobile Amateur Radio Club, and began writing a column for
the new CQ Magazine.

After serving several years as Midwest Division Vice Director he
succeeded Sumner Foster, W0GQ, as Director in January 1972, running
unopposed. His Vice Director was Paul Grauer, W0FIR. Anderson
served one term as Director, whereupon Grauer ran unopposed for the
spot, which he still holds today.

QST de W1AW
DX Bulletin 28 ARLD028
From ARRL Headquarters Newington CT
MAY 22, 1992
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB DX ARL ARLD028
ARLD028 DX news

Thanks to Paul, KB1BE, and the Connecticut DX Association for the
following DX information.

DXCC DESK. The recent S2/HA5BUS operation from Bangladesh has been
accredited for DXCC purposes.

COMOROS, D68. Baldur, DJ6SI, and Willie, DJ8CR, concluded their
operation from FR/G, Glorioso Island, on the 20th of May, and stated
that their next stop would be D6, also in the Indian Ocean.

ITU GENEVA, 4U. DF1SD and others will be active from 4U7ITU, May 28
to 31, including the WPX CW Contest. QSL to DF1SD.

MALYJ VYSOTSKIJ ISLAND, 4J. Another major DXpedition by 22 Finnish
and Russian operators will use 4J1FS, as did previous operations in
1988, 1989 and 1991. The dates are May 26 to June 9. They will be
on all bands and modes, including the WARC bands.

MICRONESIA, V6. V63DX by JA7HMZ and V63CW by JH7IOS will feature 80
through 10 meters, CW and RTTY from May 22 through 28. QSL both
stations via JA7HMZ.

WAKE ISLAND, KH9. Jim, VK9NS, is planning a late June operation.
Mellish Reef, Willis Island and Canton Island are being considered
for the future.

SRI LANKA, 4S. Four British hams will sign 4S0UK from June 11 to
July 4. Operators Doug, G0LUH, Dave, G0MRF, Jan, G0OHW and Paul,
G0ONA will feature SSB, RTTY, AMTOR and some CW on 10, 15, 20 and 6
meters. Some 80 and 40 meter activity will also be offered. QSL
via G8PDW or the RSGB Bureau.
NNNN
```

Good Luck on DX de KB8NW/OBS

SB QST ARL ARLB044
ARLB044 SM election results

Ballots have been counted in Section Manager elections for Indiana
and Maine. Terms of office begin July 1, 1992.

In Indiana,
Peggy Coulter, W9JUJ, 813.
Bruce Woodward, W9UMH, 370.
Coulter was declared elected.

In Maine,
Michelle Noel, WM1C, 493.
Jeff Weinstein, K1JW, 105.
Noel was declared elected.

Six other sections were not contested. The following were declared
elected.

In Illinois, Sharon Harlan, WB9SFT.
In Northern Florida, Rudy Hubbard, WA4PUP.
In Oregon, Randy Stimson, KZ7T.
In Santa Clara Valley, Steve Wilson, KA6S.
In Vermont, Mitchell Stern, WB2JSJ.
In Wisconsin, Richard Regent, K9GDF.

SB SPCL ARL ARLX018
ARLX018 Congrats to WD0FPY

Congratulations to WD0FPY, John Young, who was recently named 1992
"Lifesaver of the Year" by the St. Louis Bi-State Chapter of the
American Red Cross. Young, of Kirkwood, Missouri, was credited in
saving the life of a store customer who had suffered cardiac arrest.

Young is a salesman for Gateway Electronics in St. Louis. The
incident took place on the Friday of the 1991 Dayton Hamvention.
Young had postponed his trip to Dayton that day in order to man the
Gateway store. Young, 41, has been a ham for 17 years, and is a
member of the St. Louis Amateur Radio Club.

The lifesaving award is sponsored by the Red Cross, by KMOV-TV, and
by local businesses. The program was initiated in 1985. Young's
award was publicized in local papers as well as on KMOV.

SB QST ARL ARLB042
ARLB042 HR73 News

H.R. 73, the U.S. House of Representatives Amateur Radio Spectrum
Protection Act, now has 176 co-sponsors. The bill's sponsor,
Representative Jim Cooper of Tennessee, said recently that he and
Senator Al Gore, also of Tennessee and sponsor of the companion
Senate bill, are working together to obtain passage of the bills
this year.

Cooper, in a recent letter to a constituent who had voiced concern
about another amateur's complaint about the bill's potential for
encroaching on the FCC's authority to assign spectrum, said that
the American people don't elect the FCC to set telecommunications
policy. They elect the Congress to do that. The FCC was set up by
Congress, Cooper wrote, to carry out the policies that the
American people enact through their elected representatives. H.R.
73 would contribute an important policy to out telecommunications
law by setting aside the existing "Ham" bands as a sort of "Public
Park" for average citizens to enjoy.

ZCZC AP28
QST de W1AW
Propagation Forecast Bulletin 20 ARLP020
From Tad Cook, KT7H, Seattle, WA
May 16, 1992
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB PROP ARL ARLP020
ARLP020 Propagation de KT7H

Solar flares and profoundly disturbed radio conditions
dominated the propagation news last week, as a series of
strong flares blasted Earth with powerful interplanetary
shocks. The effect on radio conditions peaked at 1200z on
May 10 with a high Boulder K index of 8 and an A index of
99. At the same time, the solar flux on that day was the
lowest it has been in over two years, since the first
few days of May, 1990.

The solar flux is expected to increase slightly, to 160 on
May 19. Then it should drop down to a low near 120 around
the end of the month, where it could remain for a week.
There is a chance of another flare from region 7154 before
it rotates off the solar disk on May 16. Active
geomagnetic conditions could result from coronal hole
activity around May 16 and 17, but conditions are expected
to be quiet to unsettled again by May 18.

Propagation on 6 and 10 meters will be dominated
increasingly over the next couple of months by sporadic E
layer ionization, which reaches its peak late in June. E
skip distances are commonly 600 to 1200 miles, but
multiple hops can increase the range to several thousand
miles.

Beginning this week, the report in the last paragraph will
end with data for Wednesday rather than Thursday.

Sunspot numbers from May 8 through 13 were 139, 112, 81,
75, 123 and 118, with a mean of 108. 10.7 cm solar flux
```

for the same period was 142.6, 126.7, 124.4, 126.2, 125.1
and 125.6, with a mean of 128.4.

DX BULLETIN 25 ARLD025
FROM ARRL HEADQUARTERS
NEWINGTON CT MAY 15, 1992
TO ALL RADIO AMATEURS

SB DX ARL ARLD025
ARLD025 DX NEWS

THANKS TO TOM, N1AJO, AND THE YANKEE CLIPPER CTNTEST CLUB FOR THE FOLLOWING DX INFORMATION.

HW CONDX? THE PAST WEEK HAS BEEN SLOW AT BEST, WITH NEXT TO NO PROPAGATION EXCEPT FOR ON 10 METERS TOWARDS AFRICA AND 6 METER SPORATIC E. THERE WAS A PHENOMENAL E SKIP OPENING WHICH STARTED MAY 12 AT AROUND 1530Z, LASTING UNTIL 0300Z ON THE 13TH.

THERE WERE THREE MAJOR OPENINGS LAST WEEK. BRITISH OPERATORS FROM ZC4 LAND REPORTED HEARING THE CAPE COD BEACON ON 50.110 MHZ. BOTH THE OX AND ZD8 BEACONS ROLLED INTO NEW ENGLAND WITH VERY STRONG SIGNALS.

MV ISLAND. THE BIG OPERATION OF 4J1FS IS SLATED TO KICK OFF ON JUNE 1. THIS ONE IS TO INCLUDE AMTOR, RTTY, AND WARC BAND ACTIVITY.

MOZAMBIQUE. C9TDM AND C9RDM TRY 10 METERS EVERY SATURDAY BETWEEN 1200 AND 1500Z. C9RDM CAN SOMETIMES BE SNAGGED ON 20 METERS AROUND 0400Z.

MAIL DELIVERY WOES. UA9MA HAS RECEIVED ONLY 40 QSL CARDS TO DATE FOR HIS XV9MA OPERATION. PLEASE BE PATIENT.

WAIT FOR KUWAIT. THE NEW QSL MANAGER FOR 9K2GS IS WB6JMS, WHO ONLY HAS THE MOST RECENT LOGS OF 9K2GS. OLDER LOGS ARE TO BE DELIVERED SOOM, SO PLEASE BE PATIENT.

THE REIGN IN SPAIN. SPECIAL CALLSIGN AM0JC WAS HEARD ON THE AIR LAST SUNDAY. THIS IS NO OTHER THAN JUAN CARLOS, EA0JC, THE KING OF SPAIN.

EQUATORIAL GUIEA. 3C1EA IS ACTIVE AGAIN. CHECK BETAEEN 21340 AND 21350 KHZ FROM 1500 TO 1600Z.

RTTY MILESTONE. JA1ACB HAS JOINED THE MIXED DXCC HONOR ROLL WITH EVERY CONTACT MADE BY RTTY, THE FIRST AMATEUR TO DO SO. HIS MOST RECENT SUBMISSION OF QSLS BROUGT HIM TO THE 315 CURRENT DXCC COUNTRY LEVEL, AND HE HAS WORKED MORE SINCE. HE HAS BEEN A MAJOR PROMOTER OF RTTY OPERATION FOR MORE THAN 20 YEARS, HELPING AMATEURS IN MANY COUNTRIES TO OPERATE RTTY AS WELL AS ENCOURAGING A NUMBER OF DXPEDITIONS TO OPERATE RTTY. HE IS AN ACTIVE MEMBER OF THE INTERNATIONAL RTTY DX ASSOCIATION. ON THE MOST RECENT, 1991, DXCC ANNUAL LISTING, HIS TOTAL WAS 315, INCLUDING DELETIONS. HIS CLOSEST COMPETITORS AT THAT TIME WERE I5FLN WITH 311 AND I8AA WITH 293.

SB DX @ ALLBBS $OPDX.062
Ohio/Penn DX Bulletin No. 62

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 062 (OPDX.062)
May 25, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, ARRL, DXNL, DF4RD, OD5ZZ, KE2LJ, WK3N, WB3LHD, KP4BJD, N8HUR, WA8MEM, W0CG and UB4WZA for the following DX information.

9X, RWANDA. Michel, F1MXQ (ex J28NU) will be active for 2 months (beginning June) as 9X5KM. His operation will be mainly CW.

A2, BOTSWANA. Dave (ex-9L1US) is now signing A22MN and was active this past weekend on 28469 kHz around 1300z and 21327 kHz around 1600z. QSL via WA8JOC.

AP, PAKISTAN. John, AP/WA2WYR, can usually be found on the low end of the 20 meter CW band around 0100z. Look for him in the CQ WPX CW Contest this coming weekend. He will stay in Pakistan until August, and he plans to operate some RTTY. QSL via KK6TX (92 CB only). Also AP2MC has been active on 14206 kHz around 0130z.

FR/G, GLORIOSO ISLANDS. The four stations that were active from here are now QRT. QSL via to their home address. DJ6SI was active on CW, while DJ8CR was on SSB. DJ3OS was active on 6 meters, RTTY and digital modes and DG4FCD was active on the satellites. Their next stop will be Comoros (D6).

GB6SIX, U.K. SPECIAL CALLSIGN. This station will be active from June 1 thru September 30 to celebrate the 10th anniversay of the the UK Six Meter Group. They will be active from various counties throughout the U.K.

GB1RS, U.K. SPECIAL CALLSIGN. Activity from this station will be during the CQ WPX CW Contest from the RSGB National Convention. Operations will be limited to 0800-1700z. QSL viv G3MCX.

KH9, WAKE ISLAND. Jim Smith, VK9NS, states he will be active from Wake in late June. He is also considering being active from Willis, Mellish and Canton Islands.

OD5, LEBANON. NODXA member, Walid, OD5ZZ, informed OPDX that the OD5 stations that were listed in various DX bulletins last week as being the only legal stations were false. Walid (who was not listed) says he has a legal registration number of 310/91 from the Ministry of the PTT. The calls listed in the various DX bulletins are only members of the Radio-Amateur Libanais (RAL), which Walid is not a member. Walid states he will help answer any questions if you write to: Walid Karami, P.O. Box 782, Tripoli, Lebanon.
The official date and callsign has been released for the special event station mentioned last week to commemorate President Karami. The Karami Radio Amateur Society will operate as OD5RAK from 0000z May 30th thru 2359z May 31st. OD5RAK will operate all bands and SSB/CW/RTTY. Special QSL card will be issued.

S2, BANGLADESH. Eric, WZ6C, has announced he will be returning to the states for a 6 week vacation. He has been "PROMISED" that when he returns to Bangladesh on July 1, he will be given operating permission. He has also stated that the HA5BUS boys have taken a boat to Singapore with the intent to operate from 9M2.

SV9, CRETE. Geoff, W0CG, will be active as SV9/W0CG May 30th to June 12th from Gourves, Crete. Activity will be on 10/15/20 meters on CW/SSB. QSL to KQ8M.

T5, SOMALIA. Kent, WB8HWO (also 5B4AAL), from, Ohio is signing T53UN and will be active from here for about two months. For those who need T5, Kent shows up regularly on the 14256 DX net about 0100z. It was mentioned that the 14256 group will be sending him a vertical antenna. QSL to: Kent Phillips, Box 1642, Nicosia, Cyprus.

TA, TURKEY. Norm, KF7IK, will be active in Turkey May 21 thru 31. He will be signing /TA1 and /TA3 on 10/15/20 meters CW/SSB and RTTY. QSL to his home callbook address (CBA).

TK, CORSICA. Dieter, DF4RD, will be going the 27th of May to TK (Corse Island) and he will stay there until the 8th of June. Most of his activity will be CW and he plans to be active in the RSGB Field Day June 6-7.

TT8, CHAD. European sources say Henri, F6BAZ, is signing TT8ZH and will be active thru the end of June. There have not been any QSN reports on the OHIO/PENN Network as of yet, but frequencies mentioned are 18135 and 24940 between 0800 and 0900z. QSL via FF6KSE.

V4, ST. KITTS. Craig, WB7RFA, will be active in the CQ WPX CW Contest as V47ITU or V40X.

V63, MICRONESIA. Sho, JA7HMZ, and Masa, JH7IOS, are now active as V63DX and V63CW until May 28. They will be operating 6 thru 160 meters CW/SSB. Last heard, they were active on 7005 kHz around 1000z and 14025 kHz, around 1200z and again at 0730z. QSL via JA7HMZ: Shoji Igawa, Yokobori, Ogachi, Akita 019-02, Japan.

VA8A, CANADA. Remember to look for VA8A during the CQ WPX CW Contest (May 30-31). Tim, KQ8M, may opt to do an all band effort instead of a

40 meters only effort as first mentioned. QSL via KQ8M.

FROM THE DXCC DESK. It was announced by the DXCC Desk that S2/HA5BUS has been accredited for DXCC purposes.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

VIDEO MONITORS

Efi, 4Z4TI, who lives down the block succeeded in liberating some high quality video monitors, which we hope will prove useful in aiming and aligning his set of dishes on the various com-sats, etc.

TWO QUESTIONS:

1. Can anyone recommend a good book on basic video technology - something which can guide us through the various wave-forms, give a solid grounding in basic principles etc. (Sure we all fixed the TV and replaced that little rubber band in the VCR - but how many of us can align a TV or computer monitor from scratch?)

2. How do we get schematics for a:

Tektronix 632 B + W picture monitor
Tektronix 651 color picture monitor

Please reply to Bitnet%"rafi@bguvms"

Thanks and 73,

Earl, 4Z4TJ
Beer-Sheva Israel

>
>Is it no longer done this way?

Perhaps large aircraft do it this way. But small jet and turboprop
aircraft have no APU, and can't depend on having ground compressed
air for starting their engines. So they have a DC starter/generator
as part of the engine assembly - during normal operation it acts
as a generator, but during engine start it acts as a DC motor to
spin the turbine up to a speed where it will run on its own.

2653. Re: 2m vs 70cm in DC?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-25 19:12:42 UTC
From: ron@pilot.njin.net
Message-ID: <May.25.15.12.41.1992.26714@pilot.njin.net>
Source record: 289427

The repeater scene in DC is very fragmented by area. If you are flying into Dulles, the N4TXE (146.715) is the first one you'll find and generally pretty friendly. As for broad coverage the 146.76 (Jessup) handles the MD side pretty well.

Feel free to use any of the K4HTA machines (146.685, 448.375) from the VWS. They're sort of sleepy little machines, but again very friendly.

2654. ARRL HQ email

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-25 19:52:18 UTC
From: jbloom@arrl.org
Message-ID: <112@arrl.org>
Source record: 289429

Because of a change in the ARRL HQ email access, new email addresses
are now in force for ARRL HQ. (The old addresses will remain viable
for a short period, but you should stop using them right away.)

The access change is that ARRL HQ is now using a dial-up Internet
connection rather than a UUCP connection. This should make our
net access more reliable and timely.

Here is a list of ARRL email addresses (including some non-arrl.org
addresses). This list supercedes all earlier lists.

The following ARRL HQ staffers AND ONLY THESE STAFFERS can be
contacted directly via the net at the addresses shown. I've also
included a brief mention, where appropriate, of some of the specific
duties of the staff member so that you'll know who to contact.

Staff member, call, title address

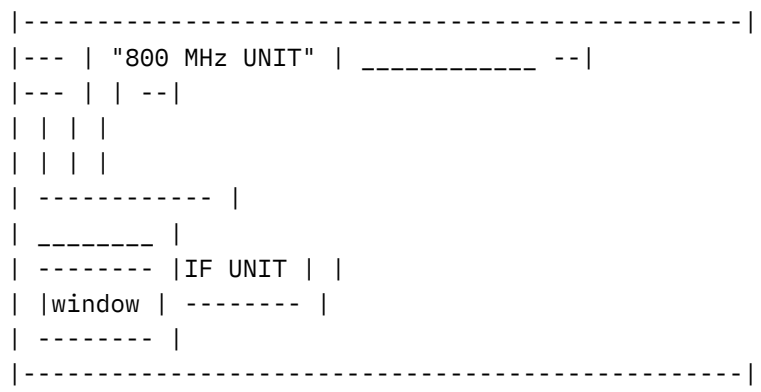
Okay, I will be more specific.
I have a nifty Uniden Bearcat BC100XLT
It only have 100 channels
It only have lo-hi-uhfI want 800 MHz capability.

The PC board is totally simple.



There is no 800 MHz unit there. Just a silkscreened place for it on the board. Is it totally inconceivable to modify the window unit and get an 800MHz unit and turn this thing into a 200 XLT?

>just pound a 8 foot grounding rod into the ground outside your window
>and run one ground wire attached to your tuner to the ground rod
>outside? I would think it would be a lot less noticable. 8-)

Because it probably wouldn't work as well, or at all.

F'r instance: if the ground wire happened to be a quarter wave at the
operating frequency, the low-impedance ground would reflect to a high
impedance at the other end of the wire -- almost no current would flow
in the "ground" wire.

A quarter-wave radial is guaranteed to have a reasonably low impedance,
so it should do a good job of decoupling stray RF currents from the
chassis and cables in the shack.

2661. Diamond X-200 antenna question

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-26 03:44:43 UTC
From: gkd@wpi.WPI.EDU
Message-ID: <1992May26.034443.248@wpi.WPI.EDU>
Source record: 289434

I recently installed a Diamond X-200 2 meter/70 cm base station antenna.
The instructions that came with it include charts which show the SWR cruve
centered at 146 MHz on 2 meters, but I find that the SWR is actually lowest
at 147 MHz. A friend who bought his X-200 well before I did reports similar
results. Does anyone know if this is normal behavior for this antenna?
It still performs quite well across the whole band. The SWR at 144 MHz gets
up to about 2:1, which is higher than I would have liked to see but is still
acceptable. The instructions said that the antenna was the U.S. version,
but I'm wondering whether Diamond just sets them all for 146-148 MHz.

>many of us can align a TV or computer monitor from scratch?)

An old Howard Sams title, "Television Systems Maintenance" by
Harold Ennes is still the most accessable complete reference
on television systems. Another book, "Technical Television"
by A.V.J. Martin is also a good primer on television fundamentals.
Both of these books are rather old and their examples deal mainly
with tube circuits, but the principles remain the same with today's
solid state circuitry.

>2. How do we get schematics for a:
>
> Tektronix 632 B + W picture monitor
> Tektronix 651 color picture monitor

Tektronix still stocks manuals for these monitors. Tek manuals are
extraordinarily through with the 651 manual running nearly 200 pages.
Cost is around $70, but is a short course on broadcast monitors in
itself.

From: a3272@mindlink.bc.CA
Message-ID: <m0lpxw5-0004jCC@rsoft.rsoft.bc.ca>
Source record: 289440

Yesterday I got a phone call from the Department of Communications whereby it was claimed that I was coming out of two telephones in the apartment complex. I agreed to work with BC Telephone toward a solution, rather than work with the tenants themselves.

In my opinion, the telephones are at fault and need to be fixed. Am I correct? What are my legal rights in Canada, as the telephone is not a transmitting or a receiving apparatus? One reason I went along with the phone company was that I did not wish to modify their equipment. Another reason was to fix any non-telco phones that may be inadequately protected. (BC Telephone will charge a hefty sum if they are called to fix a non-telco phone). Apparently BC telephone has had this problem before. I remember them having to fix my own phone in Victoria, B.C. which they did for no charge.

This problem only occurs on 80 meters (which is all I operate on), with approximately 100 watts RF output into a Butternut HF6V vertical mounted on the roof (125 feet away from my ham shack).

It may have been, but Larsen does sell one. It works decently well.
It sings when the coil is uncovered and it whistles above 65 still..
maybe taping the base would make it quiet down.

>Glass-mount antennas are usually halfwave (or collinear wit a halfwave
>bottom section) since there is no ground plane available. Normal 2m/70cm
>antennas do need a ground plane and do not work when installed on a
>glass-mount (even if the mount was designed for 2m/70cm).

The Larsen does quite well without the ground plane.

>complex. I agreed to work with BC Telephone toward a solution, rather than
>work with the tenants themselves.

>In my opinion, the telephones are at fault and need to be fixed. Am I
>correct?

I am not familiar with Canadian law, or the policies of your DOC, but
here in the USA, the FCC maintains the position that telephones or other
audio devices that receive radio signals are improperly functioning as
radio receivers (p. 18 of the FCC Interference Handbook - available from
ARRL HQ Regulatory Information Branch - call or write, they don't have
email). IMO, this position is technically correct.

Commercially available telephone EMI filters may help. I have done a recent
posting of our "EMI Resources List." If anyone missed it, send me email. I
am sending you a private email copy.

>This problem only occurs on 80 meters (which is all I operate on), with
>approximately 100 watts RF output into a Butternut HF6V vertical mounted
>on the roof (125 feet away from my ham shack).

The telephone companies (AT&T) Z-100 or Z-101 filter may work on 80 meters.
(The Z-100/101 are virtually useless at the upper HF or VHF ranges.)

If you email me your postal address, and ask for our "RFI Package" and
"RFI Telephone" packages, I will send them out. They also include the
"EMI Resources List" and our new Consumer Pamplet. (This offer applies to
all.) I will also point out that our new publication "Radio Frequency
Interference - How to Find It and Fix It" has a chapter devoted to telephone
EMI.

Good luck, and let me know if I can help. 73, Ed.

2674. Need Permanent UK license applying from USA

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-26 14:33:46 UTC
From: kwmc@cbnewsj.cb.att.com
Message-ID: <1992May26.143346.25151@cbnewsj.cb.att.com>
Source record: 289448

I am a British citizen living in the USA at the moment.

On my numerous trips home, I'd like to be able to use
2m FM, but apparently my Technician license is not adequate
for a reciprocal license, and even If I upgrade to a General
(13 wpm code ... no way) the license would only be valid for
a year and not renewable.

Is there some way I can study for, and take the exam for a British
B-class license, while here in the USA.

I can provide a UK permanent address if needed.

Failing that can I at least order study materials and take the test
on my next trip home ?

Any advice will be gratefully received.

73s,

Ken Cochran kwmc@usl.com

2675. List of University Ham Stations - REVISED

Newsgroup: rec.radio.amateur.misc

>>70cm was best to get onto in the area.

> The repeater scene in DC is very fragmented by area. If you

> are flying into Dulles, the N4TXE (146.715) is the first one
^^^^^^^^^^^^^^^^
> you'll find and generally pretty friendly.

That repeater call is WA4TXE, and Ron is right: it's real friendly and

casual... come on up and join us. The machine is privately run by Dave,

WA4TXE, and he very generously opens it to all commers. Generally speaking,

there is a *lot* more activity on 2 meters than on 70cm in the DC area, but

there is 440

coverage almost everywhere; just not all that much activity. With a 2

meter rig, you're virtually always sure of finding someone to talk to,

although during morning and evening drive times, it may be hard to get a

word in edgewise. If I had to choose, and didn't want to spring for a

dual-bander, I get a 2 meter rig for the DC area. Good luck and 73...

2679. Will the RS HTX-202 take 13.2v?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-26 16:17:16 UTC
From: jbs@rti.rti.org
Message-ID: <1992May26.161716.21585@rti.rti.org>
Source record: 289260
Cross-posted to: rec.radio.amateur.misc,triangle.radio

I am trying to sell the battery pack and rapid charger I bought for use with my ICOM 02AT. I have been told by several people that the battery pack, which is the Periphex BP-7S (1200mah @ 13.2v), will work fine on the Radio Shack HTX-202. I have been told by other people, however, that 13.2v is too much for the HTX-202 to handle.

Can anybody who has actually tried 13.2v on the HTX-202 clue me in?

Thanks.

> vendor and are they still in existence?

I use one of these. It covers 20, 15, 10, and 6 m. On 20 it has SOME gain, but more like a dipole for direction. I don't remember the specifications but if you want I might be able to dig them up at home. The antenna uses an end loaded setup for both the driver and reflector plus, the reflector has, as you said, a small quad. If you have a limited space, it is a good compromise. I don't know how it compares to the Butternut but I think they were about the same.

As far as I know, the company is no longer in business.

>after the modification. The dealer replaced the control heads with
>unmodified ones, but Kenwood has not told the dealer how to get the
>extended frequencies without the overload problem.

My experience was that Kenwood's mod information was WRONG! The
original kenwood mod sheet said that when you enable extended RX/TX
that you must not cut the "green wire", and if it is cut you should
mend it back together. I did the mod on my radio exactly as indicated
and the UHF intermod was dreadfuL! Later, I decided to heck with
kenwood's info and I cut the green wire just to see what happened.
Well, cutting the green wire took care of the intermod problems!

Here's why:

The radio's front end has electronically switchable active filters which
are either in or out depending on the frequency selected. With the
green wire in (not cut) the active filter for the ham portion of the
band is never activated and as such its UHF sensitivity is poor in
the ham bands.

After I cut the wire, I saw the S-Meter jump 5 units from one of the
local repeaters!

Don't blame the radio, it's just bad mod info.

I've not had any frequency stability problems, and the air band receive
is, well, acceptable. Not great but usable.

Thought for the day: IT IS NOT FEASIBLE TO HAVE GREAT AIR BAND / OUT
OF BAND PERFORMANCE IN A RECEIVER WHICH WAS DESIGNED FOR THE HAM
BANDS. To do so would make it horribly expensive, much too large, and
probably less-than-stellar on the ham bands. If you want a good
scanner, then buy one! Some radios, like the IC-2SRA and the IC-901
are exceptions, but they have separate, DEDICATED, wide band receivers.

Why completely discharge the nicad? This isn't to prevent the mythical
nicad "memory" effect, is it?
?

> Do not fully discharge serially mounted nicads (e.g. 7.2V battery pack):

This is good advice. Often misguided attempts to prevent "memory" in
nicads does serious damage.

2684. University Ham Stations - NET!

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-26 17:23:21 UTC
From: giasij@rs6217.ecs.rpi.edu
Message-ID: <cn_w8kd@rpi.edu>
Source record: 289456

Well since it seems there are not-a-few individuals with some
interest/concern about college clubs and for those you know
about the HAM-UNIV mailing list (a fairly inactive - soon to be deleted
mailing group). There has been a little discussion (mostly by me)
about a possible on-the-air net. I have decided (I know, I know
there is mucho work involved in a net... so just read on about
how I am going to try and get out of that!) to hold a NET
tonight! Yes folks thats 0100z-?? (no later that 0200z) Wednesday
May 27, 1992 (UTC date.. meaning Tuesday evening for the USA)
Look for me calling (W2SZ) 14246 +/- (probably +) now if that is a net
frequency (or near one), it will be my goal to find a spot somewhere
between the 256 and 236 dx groups, with enough room so they can do their
thing...

Again thats 0100z Wednesday 27 May (9pm/8pm/7pm/6pm Tuesday 26 May E/C/M/PDST)
on 14.246 +/-

No I haven't decided whether this will be a bi-weekly, weekly or one-time
thing.. so If you have any college club interest whether you are/were in a
college club, your alma mater has a college club, if you are interested in
helping a nearby college get the ball rolling, or just want to
see if any USENET-types stop by.. give a listen!

TNX es 73 de Luigi, AA1AA
jlgiasi@umassmed.ummed.edu
giasij@rpi.edu

PS: This is not endorsed by anybody but me.. meaning the school/the rest
of the W2SZ club doesn't know/hasn't been asked/probably doesn't care/
is not responsible/totally deviod of concern/probably out raising tuition/
but I can use the call so they have to deal! See you at 0100z!

I have (actually my wife - ka9kdy - has) a p2at and we can't get it to tune in the aircraft band. I followed the directions we received with the unit but no go (I don't have the instructions here but I did it several times to no avail). Could someone send me what they did to turn on the receive below 138mhz capability. Also, does this unit handle odd split repeaters? I know you can change the offset, but I just want to do that for one memory channel not for every repeater!

Also, does anyone know of any rumors of coming out with a dual band version of the P series? I have contemplated getting an IC-W2AT but am holding back in case there is a new model. BTW - the drop in charger for the P series also handles the W2A batteries. I can't believe ICOM actually did this considering they seem to like making things obsolete (power chords, batteries...).

>

My pal K7TTZ has a great MiniQuad story. He had one for awhile before he got up the guts to put up a "real" HF beam antenna. These things are quite small, operate from 20-6 meters, and can be mounted like TV antennas with lightweight hardware.

One day he was on 20 meters here in Seattle and chanced to chat with a fellow back east who was also using a MiniQuad. They were comparing notes on the antenna, when at the same time they each noticed that the antennas were pointed in the wrong direction....K7TTZ's antenna was pointed west, and the guy back east was pointed east.

They noted this fact, and were eager to compare signal reports with the antennas now beaming front-to-front, instead of back-to-back.

There was NO DETECTABLE DIFFERENCE in the signals.

Now pay close attention. Note that we are not talking about poor front-to-back ratio here. This is far worse!

Your mileage may vary. Maybe they worked better on 10 meters.

Before putting up a TH3, Jay tried a 1/2 wave dipole, and got a great improvement in performance. I did know one local ham who liked them, though. Dick Aspenwall, W7PV, who used to own Amateur Radio Supply in Seattle had one at his house, and swore by it. He loved to sell them to hams whose wives wouldn't let them put up antennas.

I think they were made by the Mini Products Co.

I bought one for my wife. There is a mode in the setup that you set
for keyboard entry. It might be PR, but I am not sure. It is in the
manual somewhere. We recieve AM aircraft on it all the time. The unit
will handle odd split repeaters. In setup, you do this too. Read the
manual carefully. It fully documents everything.

My UHF sensitivity is extremely good. Get rid of the stubby antenna!!

>The scan speed is horrendously slow when compared to radios like the

>I don't know if the 580 has improved in this area.

Agreed. The scan rate is (I'm guessing) probably about 2 or 3 channels
per second. TERRIBLE!!! I hear the 580 is pretty slow too.

Still, I like the 560 but would opt for the 580 if I were buying now.

This is not a solution, but I can share some light in my experience.
When I used to live in Hong Kong, my friend modified a handheld amateur-radio
transceiver for me (a Kenwood TH-21AT walkie-talkie), it originally had
only a red LED for transmit, but he added a dual color LED to get green
light when squelch is open (audio is coming out). There are two types of
dual color LED: common anode, and common cathode. At that time, about

For the "three-legged" LEDs. There are also the 2 legged variety
where the anode of one color is atached to the cathode of the other.

Someone asked about the xmit mod for the W2A, specifically about the need to remove a diode (in addition to adding two.) What does the diode do that needs to be removed? Does it have to be removed?

The diode that is removed enables the cross-band repeat option. Adding the diodes enables out of band TX on each band.

My Question: Which diode is for which band?

I removed and added and got out of band on VHF but not UHF, where it is more useful (and legal) for me. The soldering looks good on both so I don't want to risk lifting an etch until I know which one really needs it. BTW, I have two different versions of the mod and neither distinguish between the diodes.

>

I've never used one for a long period at that power level, but I have done it on a few occasions. I do have considerable experience running at lower power levels (5 to 50 watts output, hf or vhf, typically transmitting a lot less than half the time). If you think about it, the 15 to 20 amp level you are considering isn't too much in excess of what you might draw with headlights on and engine off in a car, and a good battery isn't damaged by a few hours of that.

You won't generate a significant amount of heat while discharging a car battery at 15 to 20 amps. The danger of explosion is primarily during rapid charging, when hydrogen gas is generated, and yes, if you try to replace the charge at a 15 to 20 amp rate you ought to be sure you have good ventilation.

The real disadvantage of using a car battery is that you'll probably have low voltage unless you are simultaneously charging. Most radios are rated to work between 13 and 14 volts, which is the normal level in an automobile with the engine running. A fully charged battery that has been sitting for a few hours since last being charged will show about 12.8 volts. Under a moderate current draw this may fall to somewhat below 12 volts. The power output of many r.f. amplifiers falls off dramatically as the voltage is reduced from a nominal 13.8 down to 11.8 or so volts. Most equipment I have used regulates the voltage for low power and receiving circuits well enough that operation is satisfactory down to close to 11 volts, but if a rig is not well designed in this respect you may see other problems, such as low audio or frequency instability with low supply voltages.

You may find that the problems of low voltage will not bother you if you can keep charging the battery at a level more-or-less the same as the current draw during receive periods. This is essentially how I operate my ham station, with a photovoltaic panel or 2.5 amp charger connected through a controller that automatically disconnects when the battery voltage reaches 15.25 volts and reconnects at 14.25 volts. Even though the peak current draw while transmitting is much more than the charger delivers, the voltage remains high enough so my rig operates efficiently.

>be plenty high enough to eat your radio.

Gary makes some good points about lightning protection, but his suggestion that passing the coaxial cable through buried metal conduit will act as a waveguide beyond (below) cuttoff is quite wrong. This myth was published several years ago by Bill Orr (W6SAI) in Ham Radio Magazine and it seems to have spread rapidly since.

The cable within the conduit simply becomes another coaxial cable. As such it operates in the transverse electric and magnetic mode (TEM) or regular transmission line mode. Transmission lines operating in the TEM mode have no lower cutoff frequency. Their transmission properties extend to DC. Thus the lightning stroke can pass down the shield of the cable within the conduit quite well. As Gary has pointed out, the velocity factor of the coaxial cable can delay the pulse riding on the center conductor of the coax. Likewise the velocity factor of the new coaxial cable formed from the shield of the coax within the conduit will retard the arrival of the common-mode pulse.

Waveguide below cutoff opening are what allow you to have small holes in a ventilated cabinet but not let the RF out the holes. If the holes are extended in length to form waveguides, their diameter can sometimes be appreciable while providing extreme attenuation of relatively low frequencies through the opening. However, the waveguides must operate in the TM or TE modes for cutoff to exist. As soon as you place an insulated conductor within the waveguide, it can now propagate a TEM mode with no low frequency cutoff.

Source record: 289466

What's the advantage of the P series? Should I be waiting for a dual-band P series radio rather than saving my pennies for a W2A? The only options I'd like the W2A to have that are missing are simultaneous same band Rx (like the 2410 mobile), and Motorola compatable DPL. Oh, and maybe a lower cost. ;-) The only info I've seen on the P series handhelds was posted here, and the info showed that it had built in tutorials and games (this doesn't interest me) and some kind of digital squelch, but I'm not sure what it's compatable with.

I sure wish they'd go back to the 02AT style case (batteries, etc) and put a W2A with my improvements in one of those. Oh well...

>for a reciprocal license,

I keep bringing this up and the ARRL keeps hoping I will shut up and go away. I will shut up and go away when the ARRL fixes this stupidity caused by outdated reciprocal agreements that they are not willing to get updated.

How outdated? Well, you can't get a recip as a technician. But you can if you hold a Conditional licence. Hands up all those with Conditional licences.

I wrote to Larry Price of the ARRL about this cos I was told he was "International Affairs Vice President". Well he wrote back a letter explaining it was not up to him but the U.K. Gummint.

Of course it is, I may be pretty cabbagey looking, but I am not green. His job I assume is to chat to the Brits and get them into the 90s. He seems unwilling to do this. In fact, judging by his letter, I get the feeling he did not read my letter and was trying to fob me off. Bad move, it only serves to annoy.

Ok, I will do this if I see no action. I will stir up the the Brits and get them to fix it. I know how to do this, I have idle U.K. lawyers and agitators at my disposal. Do the ARRL seriously want me to do their job for them?

Of course, I have a U.S. Technician licence, so you assume I have some interest. Well, that is sort of true, I also hold a U.K. licence - G8LUK.

What tweaks me is that for years and years, U.K. amateurs with the "hateful" no-code B licenecs have been able to get U.S. recip permits yet U.S. amateurs, yes even with 5 WPM, have been unable to operate in the U.K. Now both countries have a no-code licence, the damn agreement is still broken.

Either get the ARRL to fix it, or I will fix it and if I cock it up and queer the pitch for the ARRL, I am sure few will weep.

I believe your analysis is correct. Without ID capability, this
mode of operation is illegal. I am guessing that the next generation
of crossband rigs will have CW ID. (It always seems like the mfgs
never get a feature quite right the first time.)

Many hams use the crossband repeat function to monitor a frequency
via their 'home' rig while out in the yard with the HT. (Wouldn't
wanna be away from the radio, you know.) Although they are not
at the control point of the radio, from a practical point of view,
they can shut the thing down in a very short time. Of course, this
argument doesn't address the case where the ham leaves the crossband
repeat on all of the time.

Last night (Tues) I had the good fortune of a nice QSO with Virgil aboard the AES Beachcraft Starship as it traveled back to Wisconsin. He said they had the potential for 6 ham operating stations and were making contacts during the flight. Nothing like 33,000' to give you a nice strong signal. He said the Starship is outfitted with external antennas. To clear up any confusion about the craft, its a canard wing airplane built by Beachcraft of composite materials and has PW turbines.
The part I find interesting is the fact it has "a glass panel" (ie computer controlled panel) and the 6 operating hams onboard did not interfere with it. As a pilot myself I know my own HT has never interfered with my conventional nav/comm equip during my PIC flights.
My QSO with them was on 446.0 simplex. Did anyone else hear or make contact with them? 73, Andy N1FOD

If the battery exploded, they were doing something wrong. Lead acid batteries can be used for station power, but there are several caveats. *Car* batteries have changed over the years and are no longer suitable for station power, but *marine* batteries, or *traction* batteries are just fine if proper care is observed.

The problem with *car* batteries is that the manufacturers have changed the design to make them smaller and "maintenance free" in recent years. A car battery is designed to deliver high peak current for a *short* time. The plates are made very thin and calcium is added. The cells don't have ordinary vent holes. If you draw large *sustained* currents from a car battery, the plates can warp and short. If you charge the battery too much, too quickly, it can build up considerable internal pressure and get quite hot. Even relatively low current draws that *fully* discharge the battery can damage it as the thin plates come apart due to chemical action. Most of the batteries use plastic cases and thin plastic separators for the plates. Many of the newer batteries can't recover from a full discharge.

Now marine and traction batteries are built even heavier than *old* style car batteries. They use very heavy pure lead plates on wooden supports in a rubber case. They fully vent the case. You can repeatedly draw such a battery down fully and recharge it fully without harm. You do have to take care not to charge it too rapidly and you need to pay attention to the water levels in the cells. And you need to arrange to vent the gases outdoors.

The gas produced during the charging of a lead acid battery is hydrogen. It can explode in the presence of a spark or open flame. Reasonable care needs to be exercised to vent the gas away from such sources. The acid, sulphuric acid, is corrosive, and some vapors may enter the room if the battery is allowed to get hot. What you want to do is use a *marine* battery case and venting arrangement. These cases are normally made of a plastic that is not attacked by sulphuric acid and have a vent hose that you can route out a window or other opening. A homemade *wooden* case is also suitable provided it is sealed with caulk and a

vent hose is attached.

Lead acid batteries should be charged with a constant *voltage* source. For a 12 volt system, actually 13.8 volts, you want a charger voltage that does not exceed 14.5 volts. For batteries you intend to fully discharge, some form of current limiting is a good idea to prevent excessive gassing. Keep an eye on your water levels and take a hydrometer reading on the cells occasionaly to make sure they are being equally charged.

2711. R/C flying in Fort Collins, CO?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-27 11:17:32 UTC
From: gary@hpbbrd.bbn.hp.com
Message-ID: <56280003@hpbbrd.bbn.hp.com>
Source record: 289350

Hello All,

I hope this is the correct notes group :-).

I have a few questions regarding flying radio controlled model airplanes, sailplanes (glider) and gas power airplanes in the Fort Collins, CO area.

- Are there any clubs and/or flying sites in the Fort Collins area for both gas powered and sailplanes ?

- Can these sites be used without being a member of a club?

- What type of launching methods can be used for sailplanes (rubber histart, winch, etc.)

- Is there a site for slope-soaring in the greater Ft. Collins area?

- What type of license and insurance are required/recommended for sailplanes, for electric sailplanes, for gas powered planes?

- What frequencies are legal and recommended?

- Which services own the 35 MHz band?

- What other conditions exist?

Please email any replies.

Thanks in advance,

This technique is also described in FEMA bulletins for EMP hardening broadcast stations and command bunkers as well as in the NAB Engineering Handbook. If it is myth, Bill Orr didn't originate it.

>The cable within the conduit simply becomes another coaxial cable. As such

>through the opening. However, the waveguides must operate in the TM or TE
>modes for cutoff to exist. As soon as you place an insulated conductor within
>the waveguide, it can now propagate a TEM mode with no low frequency cutoff.

According to the FEMA bulletin, the conduit must be grounded only in one place, where it passes through the shielding wall. There is no continous shield connection formed. This is supposed to prevent currents from flowing on the inside of the conduit and thus preventing the assembly from behaving like an ordinary coax cable. Whether this actually works, I don't know, never having had an H-bomb go off over my station. :-)

The magnetic shielding effect is real, however, and does prevent much induced coupling to the cable shield. *That* I have practical experience to prove. I also know that grounding *both* ends of the conduit is a no-no that will allow induced currents to flow on the *conduit* and be coupled to the cable.

I live in Columbus Ohio and want to talk to someone in Canfield Oh by radio. Distance driving is only 172 miles, so straight line distance should not be to much. I live in an apartment and can't mount an outdoor antenna. The other person lives in a house and can mount an outdoor antenna. The best I could do for an antenna might be to run a coax cable from a tree outside my bedroom window or only when I transmit, stick an antenna outside? Anyway, I want to know exactly what radio set up each of us would have to use to be able to talk to each other?

Any suggestions will be a big help!!

Thanks!

As to the "Mini-Quad" antenna; I believe it was made about 10-15 years ago by the Mini-Products Company (since deceased or absorbed). A friend of mine in Princeton NJ had one, which he called " a rotatable dummy load on the tower." He was not enamored of its 20 meter performance. It DID seem to have gain and directivity on 10 and 6, though, which is reasonable, considering its size.

It looked to us like a highly-loaded, very short almost-yagi. We didn't do any tests, alas -- just put up some dipoles as replacements.

Oh arf! If you are just floating the battery with a charger, a car battery, the cheaper the better, works fine. Be sure to get a low resistance connection to your rig so the battery acts like a filter, and just clip an "automatic" charger across it. There will be very little hydrogen given off and the cells will almost never need water. The rig may pull a few more amps than the charger on transmit, but it refills quite quickly. I have done this for years with no ill effects and I leave everything on 24 hours a day.

In 1977, when I visited the RSGB station in the London Science Museum (GB2SM?) on a fine Sunday afternoon, it was active and a crowd was gathered around to see it in operation.

In 1983, there was one operator on duty and he seemed a bit annoyed at my visit. I was the only visitor at the time.

In 1988, the station was unattended, dusty, and had a sign on the counter telling interested people where they could write for information.

I wonder if the station will even be there when I return next year.

|> mode of operation is illegal. I am guessing that the next generation
|> of crossband rigs will have CW ID. (It always seems like the mfgs
|> never get a feature quite right the first time.)

I disagree, all you need to do to keep it legal is to say every 10 minutes or less "KJ6NN auxilary" and you have just sent the "ID" for the remote link... This does not have to be done right at the repeater.

I agree that a CW ID might be nice, but not necessary.

Also most of the newer rigs have the ability to have "time out timer", so that if a transmission lasts for than a preset time the cross band repeater turns off. This is consistant with FCC rules if the timer is set to 3 minutes or less.

The only real problem is to find some frequencies to put the cross band repeater. In this area the 2 meter and 70 cm bands are full. What I suggest is 1.2 GHz... I have two repeaters and a packet cluster node on this band and they all work great. There is plenty of frequency space and it is perfect for this type of operation.

Source record: 289345

I've now had trouble with *TWO* Ramsay kits. The first one was the stereo FM broadcaster. With parts as supplied the stereo pilot oscillator trimmed from 21 to 23 KHz. Not good for something that has to be 19 KHz to work. Padded with capacitor.

The second one was the infamous synthesized 2 meter rig. There were two missing parts in the kit (a trimmer capacitor and a potentiometer) which to Ramsay's credit they supplied quickly with no questions asked.

The crystals as supplied were *way* off. I have 450 PF of padding on one of the tx oscillators to get it within spec. That's a lot more than the few pf mentioned in the manual (and not, as claimed in the manual, supplied with the kit). I just don't buy "lead length" as an explanation for something this far off...

I may have actually had it working briefly. Then I accidently shorted one of the final coils to the ground plane with a screwdriver. There was a brief spark and I've not been able to get any power from the final since (though there does seem to be signal at the exciter). Probably smoked the final transistor.

Is there any ham in the Washington DC area who would be willing to give me a hand getting this beast working? I'd spring for a 6-pack or a bottle of their favorite wine...

rdewan@casbah.acns.nwu.edu (Rajiv Dewan) writes:

+The transmitter tuned up fine right away and puts out reasonably clean
+6.5W. My observation has been that the tank coils are critical. In
+the manual they recommend using a 3/8 18 bolt to use as a form for
+winding the coils. I did that and the coils looked like perfect helixes.
+On first try the transmitter put out about five watts. A little tweaking
+moved it up to over 6W. Then I noticed that my receiver wasn't doing to
+well and so worked on it a bit. The next time I tested the TX, it was
+putting out only 3W. So I guessed that I had disturbed the coils. Tried
+tweaking them. I spread them out just a teeny bit - in fact it seemed
+to spring back to the previous shape but I was back to 6.5W. The change
+in the coil was almost imperceptible. The moral of this story is that
+the coils have to be *perfect*. If you did not use a bolt as a coil form,
+it might be good to replace your current ones with new ones.

An idea just came to mind: it would probably be good to wind the coils
on nylon bolts and just leave them in [I'm assuming that you wind the
coil on the form, then unscrew the form from the new coil], perhaps taping
them down or outright shrink-wrapping it.

2727. Should I use non-ICOM batteries on my R1?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-27 17:22:59 UTC
From: rja@batcomfs.Eng.Sun.COM
Message-ID: <l27hbjINN15m@exodus.Eng.Sun.COM>
Source record: 289343
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc,alt.radio.scanner

I have an ICOM R1, and I'm planning on purchasing
some accessories for it soon. I plan on getting
one BP-84 battery for mobile operation, one BP-90
(?) AA-battery pack adaptor for emergency use,
a 12 volt DC adaptor cable, a 12 volt DC cig.
lighter adaptor, and a desktop rapid charger for
the BP-84.

Now, if I buy all the above from Grove, EEB, or
Universal, I'm looking at over $200.00 if I buy
all ICOM products. However, EEB has a BP-84
equivalent battery pack and BC-72 equivalent
rapid charger, for significantly cheaper than
the ICOM stuff. The desk charger is made by
Novex, and Peripherex makes the battery replacement.
The battery matches the ICOM part in volts,
amps, and Watt/hrs.

My question is then, is it `safe' to go with
none ICOM parts in general, and these brands in
particular? Is the ICOM stuff worth the additional
bucks?

Thanks,

Robert

2728. ? Alinco DR599 MOD ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-27 17:34:27 UTC
From: wejones@crdec7.apgea.army.mil
Message-ID: <9205271334.aa07231@crdec7.apgea.army.mil>
Source record: 289346

Several months ago, someone (Jay Appell I beleive) posted a mod to
enable aircraft band receive (and another mod for general transmit).
??? Has anyone tried this mod??? I tried the aircraft (and 800) mod,
and it doesn't appear to work, unless I'm doing something wrong. The
mod involved cutting a blue jumper and resetting the radio. I did both.
I did not cut the red jumper (ie for the general transmit). I was
wondering if the mod only works if both jumpers are cut, although the
original post seemed quite clear that they were independent of each other.
I was also wondering if there was some other way to reset the radio other
than turning it on with the FUNC button pushed (ie perhaps removing the
internal battery, which I was obviously nervous about trying in light
of all the people who complained about some radios {ICOMS} losing their
memory when the battery dies). A final possibility is that I mis-understood
how to activate the mod, but pushing the VHF key twice seems fairly simple.
Any ideas?

Thanks in advance. B.J. N3JLQ

Wow. I've always wondered just how profitable ham radio retailing is, and I guess now I know. Those Starships are beautiful planes, but cost a fortune; $2M+, I think. They also cost an arm and a leg to operate, probably around $1k/hr. Even it they're leasing it, it still amounts to a very major expense. I'm in the wrong business!

>computer controlled panel) and the 6 operating hams onboard did not
>interfere with it.

This isn't as big a surprise as you would think... the Starship had to be completely hardened against high-energy RF fields during the certification process. It was a tough job, but one side effect I'd expect would be to make it pretty immune to onboard RFI.

2733. Re: Diamond X-200 antenna question

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-27 18:24:57 UTC
From: pturner@eng.auburn.edu
Message-ID: <1992May27.132458.2851@ducvax.auburn.edu>
Source record: 289355

I recentaly installed a X-500 on our repeater (147.24) , and found the reflected power to be <.1 W (on a 5 watt bird slug) for a forward power of 14 watts, this corresponds to a SWR <1.18. I don't think this would be possable if the antenna was cut for 146, given it's high gain (8.3 dB @ 2 meters). I'll check the SWR tonight on 146 and let you know if it is any lower.

Maybe illegal according to a strict interpretation, but the capability
didn't exist when the rules were written (I'm talking about dual-band
rigs with microprocessor control). I'd have to say that it must be OK
because: 1) the FCC hasn't said NO, 2), They continue to approve radios
which do it (the TM-732), and 3) it's quickly becoming a common
practice. It's a clear case of the rules not being up to date with
the times. I don't use the capability often, but when I do I use
the following "common sense" rules:

1. Make sure that the local (car to HT for example) link frequency is
a simplex one
2. Suffix my spoken ID with "Remote Base"
3. Make sure the time-out-timer (TOT) is enabled
4. Use PL on the local link
5. Be careful to stay in band!

Does he have a U.S. Technician licence? If so, he has no legal
U.K. Reciprocal licence. If he has a General, Advanced or Extra then
he is kosher.

> etc. Is this chap American? No, he is not.

Also, during the 1970ss, I learned that if you were a U.K. National,
you could not have a reciprocal in the U.K. You had to have a U.K. licence.
This may have changed.

>

2740. Power Supply Help/NiCads

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-27 21:14:27 UTC
From: eeiswh@eeiua.ericsson.SE
Message-ID: <9205272113.AA10388@eeiua>
Source record: 289362

Being both a sailor and SWL, I might have something useful to offer on batteries. I seem to remember
reading in a yachting publication recently that traction batteries are generally regarded as the best option
as an equipment power source. I think it was Yachting World and they had an article on how to rig
refrigeration units in sailing cruisers. I don't have the exact figures in front of me but I do know DC
refrigeration units draw a lot of power and they were recommending traction batteries to handle the load.
As for NiCads. I have heard the "charge memory" story too. I *never* heard that fully discharging
NiCads was dangerous but then you learn something new each day. These new NiMH (Nickel-Metal-Hydride) cells
are *supposed* to be free of the charge-memory problem and can withstand a fast(ish) charging but the only
place I've seen 'em is on the back of a Toshiba notebook computer.
Best wishes,
Simon Woodworth.

>is there a successor to the IC-901 planned? The answer: no.

No manufacturer that wants to stay in business is going to tell you about a successor to a current model. It makes the current model rather hard to sell.

The exception is when there is an upgrade from the old model to the new model, in which case the manufacturer will go out of his way to tell you about the new model in order to sell you the old model today. In either case, they will do whatever it takes to sell you what they have to sell today.

Anyone out there tried uaing the pre-built 7.2V, 1.5AH Ni-Cad packs
which are typically used in R/C models for HT power?
I am looking into them because:
* Cheep (<$20/pack)
* Can be used as 7.2V, or use 2 for 14V for 5+W output on HT
* Will also power bicycle light system with voltage droping resistor
(system is 6V, 4.2W headlight)
* Good size/weight compramise for bicycle mobile operations
(often needed to power radio for ~2 days w/o recharging)

Under no circumstances buy the NOVEX charger. These will fry
the battery packs. I lost several Periphex batteries to the ICOM
version of it. I suspect worse problems from the YAESU style one.
After several trips back and forth with EEB, they finally confessed
to this being a known problem as the are the ones responsible for the
design and manufacture of the NOVEX.

I generally avoid EEB now, they don't give any attention to the ham
business anymore, there commercial sales being far more important and
profitable to them. They seem to take in enough money ripping off the
SWL-ers to keep the retail business alive.

A gel-cell is just a lead-acid battery with a contained electrolyte - they don't slosh. If you charge it upside-down, it will squirt liquid out the vents and eat up the steel it's sitting on.

Also, because the electrolyte doesn't penetrate the plates in the same way as a immersed-liquid lead-acid cell does, you can't push as much current into them to rapid-charge them. Standard charge rates of 5 to 7% of Ah capacity are supposed to be fine.

What precisely are the limits of the commercial bands that are adjacent to the ham 2m and 70cm bands? Is there anything else of interest in the neighborhood? What's a good reference for this kind of information?

Also, i'm looking for somewhere (a magazine, presumably) that's tabulated the features and list prices of dual band HT's, hopefully including things like out-of-band capabilities. Any pointers?

Thanks for any information...

andrew

I don't have a yard. However I do this with the repeater in the next
room and another dualband rig using an earphone or headset so I can hear
the repeater output without dense. I occaisionally use this when one
of the bigfooted lids starts trashing the repeater.

This reminds me of an event I witnessed a few years ago: I was
at an offsite job where we were using a large Motorola base
station to communicate with the mobile units. We had a large
wooden case full of, oh, about 4, heavy duty car batteries
for backup power. They were wired together for duration, by
heavy guage insulated solid copper wire.

At the end of the job, someone went to disassemble the setup.
They dropped something, or stumbled over the box, and caused
a short. Almost instantly the room was filled with the stench
of electricity and burning insulation, as the 4, 600 Amp Hour,
batteries discharged, first vaporizing the insulation on the
wires, and then melting the thick copper wire. Fortunately no
one was killed. All in all a very interesting event to see.

| 3. Make sure the time-out-timer (TOT) is enabled
| 4. Use PL on the local link
| 5. Be careful to stay in band!
+---------------
```

6. Use as vacant a frequency as you can manage.
7. If you don't have a time-out timer (e.g. IC-901, as far as I can tell), make sure you can get to the crossband repeater and shut it off within the 3-minute FCC-mandated period.

I limit my own crossbanding to 220 or 1200 simplex, with PL and tone squelch. (1200 preferred, but sometimes it's not feasible or I don't have my 1200 HT with me). I also don't do it unless I have a good reason... which almost invariably means I'm at a customer site, Skywarn is active, and I can't pick up or hit 146.76- with my HT and the halfwave. (Usually caused by computer RFI on 146.76, sometimes by too much metal between me and the inputs.) And the car is just outside so I can kill the crossband if necessary.

I suspect the FCC will continue to permit cross-band repeating as long as it's not abused/misused. As Fred said: use common sense.

Source record: 289373

I just had to put in my two-cents worth! ;-)

Out here in Southern California, there are a number of CBR's up
most of the time (illegally and uncoordinated). I've checked with
several repeater owners/trustees and asked them regarding this
issue. Some frequencies were given and I use them when someone
s not using the frequency.

Here's the practice I follow:

1. I use a 2m HT for a hot-tub which is out in my back yard.
2m set at 147.570 with CTCSS on 173.8 PL, BUT before
setting up CBR, I FIRST send out a query if the frequency
is in use; if it is, I move to another; if it isn't,
I issued a general QST notifying the PL, the CBR freq's
and what repeater will be used (generally on 440 MHz).

2. I NEVER tie up a 2m repeater and a 70cm repeater. It's
generally 2m simplex at 0.5W to 70cm repeater or 2m simplex
at 0.5W to 23cm repeater.

3. When the repeater ID's, I ID as "KC6ONL TWO METER REMOTE".
I've asked enough repeater owners/trustees 'bout this, and
this is the generalized version of that.

4. When finished with the CBR, I issued a general QST on the
2m simplex frequency that I am finished.

That's it!

Now... if there are agreed upon freq's for CBR and you do not
use too high of power (more than 5W in my book), I see nothing
illegal 'bout this operation as long as (1) there ain't anybody
already there, (2) a CBR has already been setup for this sort
of thing, and (3) the freq chosen isn't the INPUT or OUTPUT
to a repeater *OR* isn't a voice (FM) freq, i.e. AMTOR, NAVTEX,
etc.

Personally, I think that I am well within the statutes of the law.

> to Canada I wonder if they use the same electrical outlets that
> will fit the Icom nicad charger?

No. You will require the track assembly from a snowmobile and a small generator, plus a DC rectifier and some filter capacitors. To homebrew up a charger that will work, attach the generator to the snowmobile track using a pulley. The output from the generator runs through the rectifier bridge and filter cap's, then to the battery pack. Current regulation is accomplished by running a lead from the positive terminal of the rectifier, via a variable resistor, to a suitable attachment point on the sled dog. Decreasing the resistance will cause the sled dog to run faster, thus increasing the charging current.

Don't forget your parka and a toque - it's gets down to 5-10 degrees at night in Calgary this time of year.

I just picked up a National HRO500 in real nice shape, and apparently working well (I havent read the entire manual yet, just the 'quick start' instructions!)

Anyone have any experiences with this radio? The HRO dial is a gem.

From the paperwork included, this was one REAL expensive receiver in the mid seventies.

>>for a reciprocal license,

So, both of us are wrong and N1KPL is right? I was told this by
The Radiocommunications Division of the Department of Trade and
Industry.

> Is this chap American? No, he is not.

He isn't in the call book either. Certainly not the server I
use.

> Either you have your facts wrong, or this guy is operating quite illegally in
> Britain.

Two of us posting here are wrong? Plus the ARRL concedes that I
am right but won't fix it. Plus the U.K. Dept of Trade and Industry?
Kinda stacks the evidence doesn't it?

Oh, well, have to get busy and start "meaningful discussions"
with the DTI so we can clear up this mess.

Hopefully soon no-code U.S. Technicians will be able to operate
in the U.K., just as U.K. no-code Class B licence holders can operate
as Technicians over here.

I saw an ad for the new Cincinatti Microwave optical
LIDAR detector...$99 bucks!

Has anybody got one of these beasties? what's inside?
not much I presume if the infamous makers of the ESCORT
only want $99 for it.

I would guess it has a visible light filter, a GAS photodetector,
and a high gain transimpedance amp w/signal strength indicator.

What's the scoop? anybody know?

When I worked for the Telephone Co., I heard a story of a painter, unfamiliar with the way of telephone exchanges, painting the battery room (48 V batteries, essentially unlimited current available). While painting near the cieling, he placed his paint can on the nice heavy copper bars. The paint was rapidly distriubuted through the room....

I had a chance to play with one back when they were new....

Nice receiver, closer to a lab receiver or monitor receiver. The dial
nice, but the tuning scheme isn't the handiest for scanning the bands.

It actually came out a bit earlier than the 70's (like around 1964).
How much did it cost? (1992 dollars....)

From: crisp@netcom.com
Message-ID: <sn4km8f.crisp@netcom.com>
Source record: 289295

I saw an ad in CQ-Ham Radio (THE Japanese ham magazine) for
an Icom X2 radio a while back when I was in Tokyo (approx December).
The specs that were printed indicated that it was a 1.2GHz-440MHz rig
that sounded a lot like a W2A that was on 1.2gig and 440. Well I haven't
seen one in any of the Akihabara Ham shops as recently as two weeks ago
and yet the X2 continues to be advertised. Has anyone seen one and are
familiar with its features? WIll a deluxe version like the "X2A" be
offered in the US? If so when?
Any information would be appreciated.

I've had an IC-2SRA and an IC-W2A for a while now and I just purchased
an IC-R100. On the 2SRA and W2A I noticed that while scanning if you come
across a frequency and want to resume the scan you can rotate the tuning knob
clockwise to resume scanning. I've noticed that the R100 does not have this
feature. I find this extremely annoying. Could this be another one of Icom's
undocumented features? Anyone else noticed this?

i would say go all the way on the TV issue and not just allow dishes but conventional yagis and log periodics also -- if your place is like here there are enough broadcasters around that a good antenna up 30 feet can give you as much of a choice as cable does and it only costs you in maintenance. One point might be to allow TVRO/broadcast a low limit and licensed stations a higher limit....this disparity may not be legally supportable in court tho. certainly you need relief from a rule that unfairly denies you the ability to receive TVRO and broadcast signals.

i would recommend touching base with the American Radio Relay League (225 Main St., Newington, CT 06111 - believe e-mail is 2155052@mcimail.com for the "front office" but jbloom@arrl.org is the postmaster). they have a kit that contains information that contains information about other antenna rules around the country and information on FCC PRB-1. They can also supply information on antenna height and communications effectiveness and information showing that permitting the amateur enough height to get the antenna in the clear will work to reduce possible interference problems be increasing the distance between the transmitter and the receivers (overload is a common interference problem).

locally, most look to the Cocoa Beach, Fl, rules as a compromise between the rights of the ham and the public with regard to how much you can construct before you have to start getting involved with the zoning guys. again, this is if you feel you have to have rules.

most high frequency vertical antennas are no more noticeable than a flagpole would be. these tend to be about 25-30 feet tall at most. some designs include pulleys and a rope so you can also use the antenna as a flagpole if the antenna needed to be in the front yard due to space constraints. most VHF and higher verticals are about the same as a lightning rod as far as appearence - not that they are working as a lightning rod 8-).

single VHF yagis would appear like a VHF-TV antenna to an observer.

Re: wanting to get licensed. certainly since the code test was removed from the Technician class on 2/14/91 it's never been easier to get started. what can we do to help get you over the hump and into an exam session near you?

Greetings,

A while back I asked about shielding a new building that we are building next to a commercial AM/FM broadcasting facility, and many of you were kind enough to respond. And now I'm back for more...

We are putting chicken wire, er, excuse me, close-mesh wire net, in all the exterior walls and ceiling, and running 4 inch Cu strap in the foundation of the building. These will be tied to XIT electrolytic ground rods, hopefully giving us a good earth ground net. The chicken wire Faraday cage-like system will be soldered to this ground net.

The problem is that there are lots of Large Windows and Glass doors in the building, particularly in the main auditorium. My guess is that these look like Big Holes in our RF cage. My question is, as you may guess, how do we 'plug' these RF holes? (I have already suggested "get rid of the windows". That was not well received 8^))

We thought of the regular impact glass that is used in gyms that have wire embedded in them, but there is no easy way to attach to the wire (It's generally flush with the edge of the pane), and there is no guarantee that the individual wires are in electrical contact with each other within the pane.

That was my bright idea. I'm now soliciting others.

Any ideas?

Thanks in advance.

Lee

2769. Nicads, charging, and memory

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-28 12:19:04 UTC
From: Mahan_Stephen@lanmail.ncsc.navy.MIL
Message-ID: <9205281205.AA00956@lanmail.ncsc.navy.mil>
Source record: 289282

The memory effect in Nicad batteries was first observed on earth orbiting spacecraft which repeated a very precise discharge/charge cycle as the craft passed through earth's shadow. Later investigation revealed that the memory effect only appeared when the discharge cycle was repeated exactly, within one or two percent, over a fairly large number of cycles. It is not a factor in general HT use, unless you are precise to this degree in your usage of the unit.

There are two failure paths for the small consumer type nicad batteries. The first is the growth of dendrites that eventually create a short circuit path between anode and cathode. This can sometimes be reversed by shocking the battery; i.e. by pulsing about 5-10 A dc into a completely discharged cell. It seems to work about 1/2 the time.

The second method of failure is depletion of the water in the electrolyte in the cell. Cells are generally set up with a catalytic recombiner for hydrogen which is capable of dealing with most of the H2 evolved during a trickle charge after the cell is fully charged. Overcharging at a high rate will result in venting of the excess H2, with corresponding electrolyte loss. On discharge, at the end of discharge (cell reversal) when current is forced through the cell it again breaks down water in the electrolyte solution. However, in this case the cell tends to evolve O2 first, and this is lost through the vent. As the amount of electrolyte diminishes the cell capacity also diminishes. Discharging a NiCad CELL to 0V does not harm it, however, discharging a NiCad Battery (cells in series) will result in cell reversal with corresponding loss of cell capacity.

My recommendations (for what it's worth) for cell maintenance for maximum life: Estimate how much you use the HT and then charge at a slow rate (C/10) for long enough to bring the battery back up. Occasionally leave it on the charger for 12-14 hours to account for errors and assure yourself that it is at full charge. If you have a special event coming up then go for a 14 hour charge. NEVER fully discharge the battery.

Gates Energy Products has announced the availability of Ni-MH cells in various consumer sizes (AA, etc..). They also have high capacity NiCad cells and various sizes of lead-acid gel cells.

How have you determined that the output of the radio is "reasonably
clean" ? With a spectrum analyzer? Using an HF receiver? Scanner? Scope?

From the symptoms you describe, TX power dropping and then suddenly
increasing when the matching coils are disturbed, I'd *highly* suspect
spurious oscillation in the output. Most wattmeters will tell you the
total power output of the radio regardless of frequency; what you need
to know is how much of the output is at frequencies other than the desired
one. One technique is to use a tuned detector to determine the amount of
power at the desired frequency and subtract that from the total power
output. With the miniscule amount of spurious output allowed by Part 97
(-60 dB down, no greater than 25 uW), a calibrated spectrum analyzer is
really required.

Keep in mind that VHF power transistors tend to have gobs of gain at
HF frequencies and can quite happily oscillate all day. Just ask anyone
who's ever bothered to check out a Heath HA-202 broadband signal source.

I have put the original antenna (aka dummy load duck) in it's final resting place, back in the DJ580T's box where it shall remain forever. It has been replaced by the Larsen dual-band rubber duck (Kulduckie) that showed an immediate improvement in performance and adds to the asthetic value of the 580.

I also included a soft case on my order to Ham Radio Outlet, and am somewhat underwhelmed though it is definitely better than nothing. Alinco should have included this cheap piece of vinyl with the unit!

73s,
Dan

>These new NiMH (Nickel-Metal-Hydride) cells
>are *supposed* to be free of the charge-memory problem and can
>withstand a fast(ish) charging but the only
>place I've seen 'em is on the back of a Toshiba notebook computer.

I am using these cells on a product I am working on. They have
a few advantages:

Cadmium Free. This will interest the Swedes who are very anti
cadmium and will not allow plastic using cadmium dyes or metal with
cadmium plating into the country. They are described in marketing hype
as "The Green Battery". They are certainly less toxic than Nicads.

Charging is the same as Nicads 1/10 of Amp Hour capacity for
14-16 hours.

Size and shape same as regular NiCads. So can be a drop in
replacement - just remember to double the charging current.

Double the Amp Hour capacity compared to NiCads. So an AA cell
is typically 1 Amp hour, a regular NiCad is about 0.5 Amp Hour. This is
the big plus.

The BIG disadvantage. They cost 4 times more than NiCads. So in
reality, the Amp Hour cost is twice that of NiCads. Worth it for
laptops and medical eqpt etc.

I expect the price to fall as more are produced. They are hard
to find right now.

Hello,

I would like to modify my Radio Shack Pro-2006 Scanner for
bank-specific CTCSS decoding and frequency lockout. Details
are appended below. Any pointers on how to do this or
where to look are appreciated. I would also appreciate
any comments from users of computer interfaces to their
Pro-2006 and how the interface might help make the modifications
possible.

One of the mods below was in a recent post of mine. I did
not get any replies. Hopefully better luck this time. For
those of you who remember my last post, I was also complaining
of a high pitched tone when listening to cellular phones. I
learnt that this is part of the cellular system protocol,
specifically, one of 5970, 6000 or 6030 Khz SAT tones used
to assist base stations to differentiate mobiles.

Thanks in advance for any advice on the mods below,
Peter Stokes

Modification 1:

I would like to add CTCSS tone decoding (PL tones) to the
radio. This is no problem if you want ALL channels to only
break squelch on reception of the proper PL tone: just buy a
$59 board from Communications Specialists and install it. I
did this to my old Pro-2003 and it works great. Now I would
like CTCSS/PL tone decoding on my Pro-2006 but ONLY on one of
the ten 40-channel banks... So what I need is some signal from
somewhere in the radio that indicates it is scanning in say
bank 361-400, for example. I could then use this signal to
enable the CTCSS card for that bank. The big question is:
from where in the radio can I tap a signal which indicates it
is scanning in the 361-400 bank? I've thought of two
options, neither very attractive:

a) watch the address bus of the RAM chip and trigger
on the starting address of the stored channels
of the bank. This means finding out the memory
map of the CPU and how frequencies and their
attributes (delay, NFM, WFM, AM etc) are stored.
Probably not easy.

b) programming channel 361 and 400 to some quiet
frequency and in WFM (wide FM) mode. Then I
could watch the WFM output pin of the CPU to toggle
my CTCSS card on/off. Problems: can't use WFM for
anything else and it's possible the WFM pin changes
for other reasons.

Modification 2:

It would be nice to be able to lock out specific frequencies
when searching with the Pro-2006. For example, when
searching the trunked systems band around 850Mhz, there are
several data channels which the Pro-2006 stops on every
time through the search range. It would be nice to be able
to hit a button to tell the Pro-2006 to skip this frequency
if it ever encounters it again. I believe this is a feature
available on the AOR1000.

Well, the [relatively] new NSA buildings used a metallic tint on the windows --
the kind that you can see through from the inside but looks reflective from
the outside. You might try something like that.

2781. Portable vs. Mobile Question

George:

While this is a very interesting theoretical excersise, I think
it has little importance in real life. I think there is not
a dividing line between mobile and portable, ie., ther are times
that is appropriate to do either one.

I never use portable, except if I have crossed state lines and even then,
I live in CA, but have a 2 call and will not spend the next 5 years of
medical school signing portable or /6. So, the moral.... Don't worry
about it, unless you are seeking the answer to a theoretical question,

Mike, WB2TBQ

>them down or outright shrink-wrapping it.
>

An interesting idea. That would stiffen it up and prevent it from getting distorted. There are a couple of caveats: The coil inductance will change a little and at these frequencies it may be critical. For these small inductance coils, the stray capacitance between turns and between turns and ground are significant and these would change with a change in dielectric. The other caveat is that you would have to saw off a piece of the bolt no bigger than the coil as there is no extra place in the pc board.

If you are successful at this do tell us as there are many Ramsey kit builders on this net.

>It actually came out a bit earlier than the 70's (like around 1964).
>How much did it cost? (1992 dollars....)

Yes, it was certainly before the '70s. I played with one (lab at
NRAO, Green Bank) in 1968. The HRO dial is defintely something to
die for; well, at least to drool at.

The tuning scheme is not really *that* bad. The first L.O. is locked
to a 1 MHz comb, if I remember correctly. You turn a knob until the
"lock" light comes on. The main dial then acts as a 1 MHz bandspread.
(Some Racal receivers and HP spectrum analyser front-ends of that
generation worked in similar fashion.)

Any OFs want to tell us about the HRO-50? From pictures, the
main dial looked similar to the HRO-500's (small rectangular windows
on a 5" or so diameter dial where the 100 kc/s markings show
through; the circumference of the dial is marked every 1 kc/s).
The OFs probably don't even consider the '500 to be a "real" HRO
:-).

Whatever happened to National, anyway? And, speaking of old receivers,
why is it that I have never stumbled over a single RCA AR-88 receiver
in this country?

Message-ID: <BoyzM4.FsI@acsu.buffalo.edu>
Source record: 289308

We've shuffled a number of machines around here the last few days and some of these changes might be noticable to you guys.

First, the ham archives that are publically ftpable have been moved from "armstrong" to "talos". If you were using the absolute name or IP address to get to these archives it isn't going to work much longer. If you use the alias "ftp.cs.buffalo.edu" as recommended, you should notice no difference at all and this entire change should be transparent to you.

Also changed is the callsign server commonly referred to as "marvin". Well, marvin is getting really old and since I am not going to be around this summer to baby him, I moved the server to a machine that will be more solid. This machine is "electra". Again, though, if you use the alias "callsign.cs.buffalo.edu" to access the callsign server you won't notice the change.

A README file will be left in the ftp server directory to direct people to the new site and a help message will be printed for those that try to access marvin for callsign service.

We now return you to your regularly scheduled newsgroup.

Devon

I have a couple of questions regarding the difference between signing
portable or mobile. The theory books I studied to pass my
tests don't seem to explain that very well.

1. WHAT is the difference between the two?

2. Suppose that I have an HF QSO in mycar, WHILE driving. I sign
"N2OWO mobile," right?

3. Now, what if I have a QSO in my car, WHILE PARKED somewhere.
How do I sign then?

4. I now take my setup to Pennsylvania and set the stuff up in
a friend's house. How do I sign NOW? "N2OWO stroke 3?"
"N2OWO portable stroke 3?" "N2OWO portable 3?"

5. How do these IDs work in CW? Like, if I'm driving in PA, how
do I sign? "N2OWO/M/3 ?"

This can get quite complicated :-) I'd appreciate any help.

> available on the AOR1000.

As far as skipping trunked system data channels with a PRO-2006,
perhaps you could "discover" some characteristic about the distribution
of audio frequencies in the data signal. Using this information,
augment the filtering in the squelch circuitry so the squelch would
think data channels are "noise," and skip to the next frequency.
Or, you could alter the window detector circuit so the 2006 thinks
the signal is not center tuned and skips to the next frequency.
The first option would make the 2006 skip data channels when
scanning memories or searching. The second option is only useful
when searching.

If the squelch is set above a certain threshhold, my 2006 will
skip over the cellular control channels which transmit data.

>complex. I agreed to work with BC Telephone toward a solution, rather than
>work with the tenants themselves.

>In my opinion, the telephones are at fault and need to be fixed. Am I
>correct?

I don't know the law in Canada, but from a technological standpoint, it
is the phone that is at fault.

On the other hand, "discression is the better part of valor" -- if you
can make some change at your end that improves the situation, you stand
to gain in neighbor relations.

The idea is to keep from radiating RF into the phone lines. Do any
phone lines run near your antenna? If so, try moving the ant. to another
location. Is there RF flowing on the outside of the coax shield? If
so, try adding one or two 80 meter radials (1/4 wave long) connected to
the antenna base. Also try a 1:1 current-type balun between antenna
and feedline. You can make one by wrapping many turns of the coax
through a large ferrite toroid. Or just coil up a dozen turns of
coax (with no toroid) and tape them together. Sometimes this is enough.

For test purposes, borrow a cheap telephone with lots of "bells and
whistle" features (the kind most susceptible to interference.) If you
can get a phone in your apartment to act up, then you can use it to
tell whether any changes you make are improving things.

I've been doing some research on lead-acid batteries with an eye towards using them to provide power for our ham radio repeater site.

Our site is difficult to get to, and the commercial AC mains power goes away at times. Everything in the site runs off a nominal 12 volts DC. During idle periods, the equipment may only draw a few amperes, but most of the transmitters can draw up to 10 to 15 amps each. A maximum drain of 100 amps isn't out of the question, although it would probably be only for a few minutes at a time. Some systems (such as the digital communications equipment) key on and off quite regularly, with perhaps as much as a 50% duty cycle, whilst others may not key for hours and then stay on for as long as an hour or two (voice repeaters during drivetime). We do not want there to be any interruption of power when the mains fail. We don't believe that most of the outages are of a duration that a generator will be necessary - a few hours is sufficient.

It is clear that a good solution to our problem is a bank of lead-acid batteries capable of supplying the peak current, floating across a supply that can recharge them and supply the standby and perhaps one or two transmitter's demand.

Ok, that's the problem. Here's what I've found.

Lead-Acid batteries commonly available today can be roughly grouped into three categories by construction and intended use:
1. Automotive starting
2. Traction
3. Stationary

Automotive starting batteries are formulated with thin pasted plates and are designed to supply high peak currents for brief periods of time whilst cranking an engine. They are not expected to be discharged to more than perhaps 75% of capacity, and are expected to be recharged immediately after discharge. If used in deep-discharge or float service they will not last long. (I.e., the capacity of the battery will diminish fairly quickly. While it will still act as a battery, it will not be able to supply its rated capacity soon after being placed in the wrong kind of service.)

Traction batteries are made with thick pasted plates and have very rugged separators between the plates to make the battery more immune to physical shock and vibration, and to reduce the chance of failure due to dendritic growth during recharging. These batteries are sold for use in electric forklifts, golf carts, marine trolling motors, and RV power. They are designed to be discharged nearly fully each day, and

recharged each night. Because there is some tradeoff in battery life by using the pasted plate construction to keep the size and weight of the battery down, they are not used in applications where extremely long life is required. The commonly-available Deep Cycle Marine batteries are of this general type.

Stationary batteries are made with thick solid plates. They are designed to be used as standby power, supplying minimal power and kept in a state of nearly full charge until needed. They can take deep discharge. Because of the solid plate structure, they are bigger and heavier, but their lifetime is much longer. One source suggests that 10 years is not unusual. Some photovoltaic storage batteries (for solar-powered homes and such) are of this type.

The best battery for our application is the Stationary battery, but they are not commonly available. Much more readily obtained are the Marine/RV batteries, at about $50 apiece.

Charging and discharging these batteries is a big question. I posted a query to the net and received about a dozen replies, most of which contradicted each other in one or more points. However, there is some consistency in the information available in our library, and I'll try to summarize it below.

Note that all the voltages given below are for batteries at working temperature - typically 80F (27C).

DISCHARGE:

Batteries are rated at an Amp-Hour capacity at a specific rate. For traction type batteries, this is typically a five hour rate, so a fully-charged 100 Ah traction battery in good condition can supply 20 amps for 5 hours before it is exhausted. Stationary batteries are usually rated at a 10 hour rate, and automotive (if rated in Ah at all) are given for a 20 hour rate. The discharge curve is NOT linear; if you double the current drain, you will get less than half the time. Similarly, if you halve the drain, you will get more than twice the time.

Each type of battery has a specified voltage at which it is considered completely discharged. If discharge continues below this voltage, the battery life may be considerably shortened, and repeated abuse of this kind can result in a battery which cannot practically be recharged. Each battery manufacturer specifies this voltage; in general, the final voltage for the three general types of batteries are

automotive 1.75 v per cell
traction 1.70
stationary 1.85

Thus a typical 12 volt marine battery with 6 cells should not be discharged below about 10.2 volts.

Another way of looking at it is that no cell should be discharged more than about .3 v below its full-charge rest voltage.

A typical cell will show the following voltages:

fully charged, open circuit, at rest with no
charge/discharge for at least 12 hours 2.12 v/cell

As soon as load is applied (internal v-drop) 2.00

fully discharged, under load 1.70

fully discharged, open circuit 1.99

beginning of charging 2.10

70% to 80% charge (gassing begins) 2.35

full charge 2.65

CHARGING:

Liquid-electrolyte lead-acid batteries can be recharged at any rate that exceeds internal and surface discharge rates, and which does not cause excessive gassing (liberation of oxygen, hydrogen, and steam).

In non-float service, there are several simple chargers.

A single-rate (constant-current) charger limits its charge rate to about 7% of the Ah capacity of the battery; for a 100 Ah battery, it would charge at a rate of 7 amperes. Since the battery will start at about 2.1 v per cell, and finish at about 2.7 v per cell, the charger must be able to vary its voltage over this range. For a "12 volt" battery with 6 cells, the charger will need to supply between 12.6 and 16 volts over the duration of the charge. Charging is complete when the battery reaches 2.65 to 2.7 volts per cell.

A simple taper charger is a constant-voltage source set to 2.8 volts per cell with a series ballast (typically a resistor, but a choke or the internal resistance of the supply can be used) that limits the output current to 7%C when the battery is started charging at 2.1 v/cell. Again, charging is complete when 2.7v/cell is reached.

Trickle-charging of a fully-charged battery can be done to keep it charged. This is done by supplying .5 to 1 mA per Ah capacity. Trickle charging should be discontinued when it has continued for at least 24 hours and the battery has reached 2.25 v/cell. Typically, trickle chargers are set to run perhaps once a week. Because of their thin plate construction, automotive-type batteries will deteriorate if trickle-charged for more than perhaps six months.

An interesting research result was that using pulsating rectified AC or superimposing a small AC current on pure DC charging current increased battery life by up to 30%. Apparently the mechanism is that is reduces gassing and leads to a more porous lower-resistance plate, and lessens the tendency to form dendrites during charging.

In float service, where the battery is in parallel with the mains supply, the supply voltage must be set to 2.15 to 2.20 v/cell. This will charge the battery, and avoids excessive gassing, but does not serve to "freshen" the cells - there is not enough gassing activity to move electrolyte around and clear the beginning of deposits from the surfaces of the plates. It is recommended that batteries in float service occasionally (perhaps once a month) be charged to 2.65 v/cell to freshen and equalize the charges. In large installations, this is done by switching parts of the battery banks out of service in rotation. In smaller systems that can tolerate the voltage excursion, it can be done by simply boosting the output of the mains supply.

Charging inevitably leads to some water loss due to gassing; 100Ah of a gassing charge (2.4v or more per cell) will yield about 1.2 oz of water loss. Hydrocap Corp [975 NW 95th St, Miami Fla, (305)696-2504] makes a replacement filler cap that contains a catalytic material that recondenses emitted steam, and recombines the hydrogen and oxygen gasses into pure water that then dibbles back into the cell, greatly reducing the required maintenance. With the available flame arrestor option, they sound ideal for unattended battery systems, and should greatly reduce the danger of fire and explosion from liberated hydrogen. They're about $5-$10 per cell.

A few months back some one posted the process and people to contact in Mexico to get an amateur license for operation with-in that country.

Could someone who has a copy of this posting please repost or send me a copy. I am planning a trip there an would like to take some radios to keep in contact.

Thanks in advance
Don WB6LFC

2793. Nye Viking tuner = Johnson matchbox???

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-28 19:04:48 UTC
From: keith@radio.nusc.navy.MIL
Message-ID: <167@radio.nusc.navy.mil>
Source record: 289312

I recently purchased a Nye Viking 275 watt antenna tuner at a hamfest. I'm told that this is basically a clone of the small Johnson matchbox that was made some time ago. I've seen the Johnson matchbox at various hamfests, but never actually looked inside of one. Is this clone story true?

The name "Viking" seems to be connected to Johnson also, since they made the Viking Valiant, Viking Ranger, etc. A quick check lists them as being located on Viking Drive in Minneapolis.

Was there some connection between these companies?

I realize this isn't of earth-shaking importance , but I'm curious as to what gives here.

Regards,
Keith (WA2Q)

UoSAT Report 0528.92

UoSAT Status Report 0528.92

*** UoSAT Bulletin 0528.92 28 May 1992 ***

UoSAT Mission Control Center
University of Surrey, Guildford, Surrey, GU2 5XH, England

As part of the British International Space Year, the University
of Surrey is proud to announce its 'UoSAT Educational Challenge'.

The UoSAT Educational Challenge is open to any school or college
and simply consists of submitting a project report of any length which
includes some aspect of using the UoSAT satellites. The University
of Surrey has two satellites of its own which can be used in the classroom
providing 'hands-on' experience in satellites and information technology.
Communicating with the satellites is simple and fun and opens up the
world through receiving its images of the Earth and data from the
science experiments on-board as well as communicating between radio
amateurs around the world using the satellite's 'flying mail-box'.

Every group that enters will receive an award, with the top three
reports receiving a special limited edition hologram which is
the same as the one unveiled by H.M the Queen when she visited Surrey
on 20th March 1992!

The closing date for the challenge is 30th November 1992 and
the prizes will be awarded by the UK astronaut Helen Sharman at a
special schools lecture to be held on 9th December 1992 at the University
of Surrey.

If you would like to receive the UoSAT Educational Challenge
Information Packet please write to the UoSAT Educational
Challenge, Centre for Satellite Engineering Research, University of
Surrey, Guildford, GU2 5XH, UK or telephone Mrs Brooks on 0483 509143 (UK).

*** End of UoSAT Status Report - 0528.92 28 May 1992 ***

>in all the exterior walls and ceiling, ...

>The problem is that there are lots of Large Windows and Glass
>doors in the building, particularly in the main auditorium. My
>guess is that these look like Big Holes in our RF cage. My
>question is, as you may guess, how do we 'plug' these RF holes?

If the primary problem is the AM transmitter, then you don't need
to plug the holes. A door or window is much less than a half
wavelength at the highest AM band frequency (1500 kHz ==> 100 meters),
so the shielding should be excellent.

On the FM band, 1/2 wavelength is only about 1.5 meters. You need
to keep the max dimension of any opening to less than about 6 inches
or so to get decent shielding.

Will the doors and windows have screens? If so, perhaps you could
somehow bond the aluminum screens to the "chicken wire".

If that happens, you aren't using a "gel-cell"!

Gel-cells get their name because the sulfuric acid electrolyte has been combined with a substance to form a jelly. The gelled electrolyte is then soaked into a coarse gauze-like blotter (to further immobilize it) that goes between the lead and the lead oxide plates.

The reason that gel-cells have slightly more conservative charging and discharging characteristics, than liquid cell batteries, is they have less liquid electrolyte to work with. If you cause them to outgas too much, you will dry the cells out. This is what usually ends the life of "float-charged" gel-cells used in standby power supplies.

It is not required that you sign portable or mobile in the US.
It is not necessary to sign /<call_sign_area>, either.

People do so:
1. Because their old farts and too set in their ways to
change now.
2. Force of habit.
3. They think that they have a better chance of working DX
(I'm still for WO2L/cruddy dipole).
4. They wish to inform people that they are not where there
call signs make the appear to be, (KH6's, KL7's esp.).

Anyway, on CW, you signed /<call_sign_area> regardless of whether you
were portable or mobile or in your own area or not. The rules say
that you can put anything you want after a call as long as it doesn't
appear to be a valid prefix.

>-Rich
>WB2JBS
>rharel%fab8@sc.intel.com

this could be fun. can just imagine Cato and the ProdGods trying to censor the internet mail. I sure would think that an Internet/Prodigy tie isn't all that likely given how they've treated their subscribers in the past.

Compuserve has a mail gateway and GEnie is supposed to have one in the near future (someone picked up on the test account names accidentally.). So does MCImail.

but that's not the question is it?

How to Send Mail from Internet to Prodigy (volume 1).

If you have a Prodigy Account:

1) Print it out and reenter it online.
2) Use one of those utilities to be able to read a mail message into a mail screen. This may require you to to manually break the file into P* sized chunks

If you don't have a Prodigy account, you would have to find someone who does.

Gary, I found this posting for you:

Article 15023 of rec.ham-radio:
From: gopstein@helix.squibb.com (Rich Gopstein)
Newsgroups: rec.ham-radio
Subject: FT736 2m RX mod!
Date: 15 Jan 91 15:17:09 GMT
Sender: news@soleil.UUCP
Organization: Bristol-Myers Squibb PRI, Lawrenceville, NJ
Lines: 37

I found this on Compuserve. I tried it on my FT736, and it works! I wonder
what the other diodes do? Does anyone have a service manual for the FT736?

Fm: Chuck Scott N8DNX 76556,3335

You can modify the 2 Meter section for 141-154 MHZ by adding D27
(not installed in USA version). This is normally soldered to the
board but you can easily install it by simply shoving the leads into
the connector. The 2 Meter section is the middle board looking into
the radio from the top. The connector (J09) is the large one on the
right side of the board, half way back. You want the cathode (striped
end) of a small signal diode in pin 7 and the anode in pin 4. Pin 1
is toward the front of the radio.
To receive over a slightly wider range, place the SAT switch in RX mode,
press ENT[D] then enter a desired frequency and press ENT[D] again. You can
enter any frequency from 100 to 200 MHz this way. Unfortunately, the
synthesizer does not actually cover that range. As far as I can tell the
bottom end is about 138.5 (not quite the 136.5 needed for the weather sats).
The top end is about 155.6. You can't perform this stunt with the normal
(non-satellite) VFO's. Also, once a frequency is entered in this way, it is
possible to tune toward the normal range but tuning away will place you back
in the 141-154 range. Using the same method yields aprox 220.0-229.5 &
423.0-454. You may store these frequencies in the SAT Memories.

>>Whatever happened to National, anyway? And, speaking of old receivers,
>>why is it that I have never stumbled over a single RCA AR-88 receiver
>>in this country?

National finally went out of business last August. They were doing some
government stuff, but under the chapter mumble. The IRS finally
took possesion and auctioned it off. The VP of production bought the
rights to the company from the IRS, and then sold off the old warehouse
stock, so they could move to a small building. I knew the guy, so a few
of us Hams went down and rumaged and grabbed stuff and paid him some money
for the stuff. I got alot of parts to restore some old National stuff
I had hanging around. They had one HRO500 there that was missing
pieces, and I didn't take it. I should have. THere was also about
5 uncomplete NCL2000 amps and 10 uncomplete NCX1000 xmitters. (Plus
one of those atomic time keepers.)

lot of history there, but it's all gone. It's too bad. National was one
of the best, in my opinion. It has sentimental value. My first novice
setup in 1970 was a National NC57 and a 6L6 xmitter. SIgh...

>Any OFs want to tell us about the HRO-50? From pictures, the
>main dial looked similar to the HRO-500's (small rectangular windows
>on a 5" or so diameter dial where the 100 kc/s markings show
>through; the circumference of the dial is marked every 1 kc/s).
>The OFs probably don't even consider the '500 to be a "real" HRO

I used an HRO-60 as my first receiver in the 1958-62 time frame.
It was a fine receiver for it's time. Remember, this was when
phone meant AM, and SSB was something only a few wierdos used.
It had the famous National dial with the little windows which
contained numbers that incremented from 0 to 500 as the knob
rotated. This was all mechanical, of course. With gears, for
those of you who've never seen pre-LCD equiptment. The readout,
however, was not in KC/s -- the linearity of the tuning cap wasn't
nearly good enough for that - but rather just a "logging" number.
The HRO 50 and 60 had plug in tuned circuits which were large
boxes (2"x6"x10") which were sild into the chassis from the front.
Each coil box was one band of frequencies - eg 2 -7 Mhz. There
were also some with expanded ranges for the ham bands, as I
recall. With each coil, one got a clever plastic scale with
frequency markings which was to be mounted on a rotating turret
visable one scale at a time from the front, There was a pointer
driven off the big tuning knob, and this was the frequency indication.
As I recall, I had about 8-10 coils for mine. The high-Q coils
made possible by all the space in the plug in coil drawers made for
excellent (again, re 1960) performance. Now that I think about it
one of the differences between the 50 and 60 was the plastic scale
and dial pointer. The 50 just had a frequency vs main dial reading
graph hand drawn on each coil drawer.

Subsequently, I used an HRO 500 for a period of time. I was never
impressed with either its performance, which was very medioacre, nor
its reliability, which in the current vernacular, sucked. Remember
this was one of the first synthesised radios. I recall major problems
keeping the plo alignment close enough so that it would lock up. Also,
the transistors (this was also one of the first solid state radios)
were socketed, leading to constant poor contact problems.

I haven't even thought about those radios in 25 yrs, so my memories
may be a little hazy.

Message-ID: <9205290015.AA24714@ucsd.edu>
Source record: 289231

Hello Kit Builders,

A previous post noted that the tuning of the coils in the FTR-146 were very touchy. A follow-post noted that this could be caused by oscillations in the final stage. The only way to tell was to do a tune-up with a spectrum analyzer.

I did just that. I noted that imperceptible movements in the coils would cause large changes in the output power. However, it did not have a great effect on the spurious and harmonic emissions. The tuning of the final is not effected by the tuning of L26 and L27 in the receiver front end. It is effected by the tuning of L15 in the output pi network. However, adjusting L15 has little effect on the receiver sensitivity.

For tuning the receiver, tweaking L26 and L27 appears to work best. On the transmitter, L14, L15 and L17 have the most effect. Tweaking L16 doesn't seem to have much effect.

On another issue, putting a 5pf capacitor across the tuning diodes in the oscillator circuits seemed to cure any off frequency problems. However, this swamped out the tuning required for the 5 kHz offset. I would appreciate it if anyone has a mod that will fix this problem.

If anyone has any component modifications to the transmit section, I would also be interesting in hearing about it. All in all, I enjoyed putting the kit together. It works well and I think it is a good value especially when it comes to being able to modify the radio.

> they can shut the thing down in a very short time. Of course, this
> argument doesn't address the case where the ham leaves the crossband
> repeat on all of the time.

Many hams do use remote operations such as mentioned above. They
often have a mobile or base crossband out to a handheld or another radio.
From what I have HEARD, it is legal IF the remote base is either physically
monitored (ie sitting there by it) or if you can access the remote base via
radio above 220 MHz (ie it is illegal to control a remote base by 2m but it
is legal to control a remote base by 220 MHz or by 70cm).

DISCLAIMER: This is only what I've heard... These are not hard, concrete
facts... :-)

DON`T GUESS> MEASURE TWICE THEN BUILD ONCE.
I would use a portable radio/TV to measure the RF level in the building
and confirm your suspection. Your Faraday cage, must be done properly so
that you don't create what I like to call a FARADAY ANTENNA. You can get
RF leakage thru the edge of a metal door with a 1 mm gap. But you are
correct in thinking the window will allow RF in, depending on the
wavelength (or 1/4 wavelength).
Once you measure the hot spots, and by the way expect to get standing

waves where the level peaks and dips as you move around, so get an average reading... THen you may be able to use "Chicken wire" on the outside or inside of the building connected to ground via braided wire. Consider it like Mosquito screen except the "bugs" are bigger so large mesh is alright.
If you know the frequency, you can be even more effective my making the shield a notch filter. ..but never mind...

What are they trying to protect in this building?? Electronic equipment? or electronic sensors?

Hi Dick... You will not have any problems, we have the same type of electrical system as you do.

Have a nice trip... 73 de Doug! VE2URA/VE2VMS

2813. Re: Cross Band repeaters, Legal?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-29 04:25:17 UTC
From: bobw@col.hp.com
Message-ID: <1992May29.042517.20431@col.hp.com>
Source record: 289237

[I am cross-posting this to rec.radio.policy since its likely to
turn into the usual legalistic argument. Enjoy.]

>From: n9gbj@n9gbj.ampr.ORG (Bryan QRV Biggers)
>Newsgroups: rec.radio.amateur.misc
>Subject: Cross Band repeaters, Legal?
>Date: 22 May 1992 09:59:17 -0700
>
Let's see. N9GBJ started all this crossband repeat discussion with:
>
>All this talk about cross band repeater mods lately, aren't they, er,
>well you know, technically illegal to use unless you ID them? Its a
>transmitter, right? And isn't it uncool to control them on the 2M side?
>I suppose its like out of band mods; none except the MARS mods could
>actually be used. (no type acceptance).
>
I innocently agreed with:

> I believe your analysis is correct. Without ID capability, this
> mode of operation is illegal. I am guessing that the next generation
> of crossband rigs will have CW ID. (It always seems like the mfgs
> never get a feature quite right the first time.)

And Phil Graham says:

>I disagree, all you need to do to keep it legal is to say every 10 minutes or less "KJ6NN
auxilary" and you have just sent the "ID" for the remote link... This does not have to be
done right at the repeater.
>
As Bryan already pointed out, this method only IDs one side of the crossband
repeat. The other side is not IDed. Therefore, in the strict interpretation,
its not legal.

>The only real problem is to find some frequencies to put the cross
>band repeater. In this area the 2 meter and 70 cm bands are full.
>What I suggest is 1.2 GHz...
>
I basically agree with this. Prudent use of crossband repeat should not
be a problem. Stupid use is a problem.

Bob KB0CY

P.S. Don't ask the FCC.

VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)
```

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair, P=Poor, VP=Very Poor, EP=Extremely Poor.
VHF Sig. Quality rated as: AN=Above Normal, N=Normal, BN=Below Normal, D=Disturbed (ex. associated with polar blackouts).
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active, 5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active, 30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High, VH=Very High.

PEAK PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (29 MAY - 07 JUN)

EXTREMELY SEVERE									HIGH
VERY SEVERE STORM									HIGH
SEVERE STORM									MODERATE
MAJOR STORM									LOW - MOD.
MINOR STORM									LOW
VERY ACTIVE									NONE
ACTIVE	*	*			*	*	*			NONE
UNSETTLED	***	***	***	***	***	***	***	***	**	**	NONE
QUIET	***	***	***	***	***	***	***	***	***	***	NONE
VERY QUIET	***	***	***	***	***	***	***	***	***	***	NONE
Geomagnetic Field	Fri	Sat	Sun	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Anomaly
Conditions	Given in 8-hour UT intervals										Intensity

CONFIDENCE LEVEL: 75%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:
The 10.7 cm solar radio flux is plotted from data reported
by the Penticton Radio Observatory (formerly the ARO from
Ottawa). High solar flux levels denote higher levels of
activity and a greater number of sunspot groups on the Sun.
The 90-day mean solar flux graph is charted from the 90-day
mean of the 10.7 cm solar radio flux.

> its not legal.
>
> Bob KB0CY

This is only a problem for those people who do not have a dual band walkie to go along with their radio, and can't switch to the other band to ID the other side of the remote. But then, who's going to take the time to do that every ten minutes? Every thirty minutes is more reasonable, and every hour even better... But then, I think the FCC is gone overboard with their ID requirements.

Brent

2816. New England Field Day *** Your QTH Wanted ***

Subject Field Day Publicity YOUR QTH INFO WANTED

Send me your FD QTH

I am working at getting an article on Field Day (and Ham Radio in general) published in the Boston Globe. The draft is close to done and I think there is a good chance to get it in the Sunday Globe the week before FD. The article invites the reader to visit the local club operation, I hope to have a box after the article listing FD sites thruout the area. If you would like visitors please send me your club name, field site and town. I will try to fit in as many a we can.

I think clubs from NH EMA and RI would be appropriate.

Remember NO Guarantees; there is only a good chance the article will get published and I have no idea how many clubs will fit if they do take it :-(

>tests don't seem to explain that very well.

>1. WHAT is the difference between the two?

As I understand from my readings, MOBILE is when your station is on a
a transportation device. PORTABLE is a station that can be easily
moved and setup for operation in another area, but not operated while
being transported. The example of portable I remember is a station
that is brought to and used at a summer home.

However, the new meaning of PORTABLE seems to be operation of a
handheld radio.

The distinction is academic now since such pro-signs are no longer
required.

George,

In all cases, you sign N2OWO. The FCC dropped all requirements for signing moble or portable a long time ago.

Kok Chen, AA6TY asks:-
>
> And, speaking of old receivers, why is it that I have never stumbled
> over a single RCA AR-88 receiver in this country?
>

Well, i think us Brits bought them all..... I have two in my shack
and three in my attic. The AR88 was used extensively as a surveillance
receiver during WWII (Together with the National HRO-5 series). I have
a photograph of an Intelligence-service listening-post which has a number
of consoles, each with four HRO-5's and a pair of AR88's and what looks
like a brace of Hallicrafters S27 (photo not clear enough for a positive
identification).
One of my AR88s came complete in its original packing-case with an official
Military requisition-form dated 1944. Several thousand AR88s were bought
from RCA by the British forces; radio gear of all types came over by the
ship-full. Then after WWII, all this stuff hit the government-surplus
market. AR88s are still popular over here, despite their size and
weight. Spare parts supply is the only problem; you can get new tubes
off-the-shelf (genuine RCA-branded JAN-series tubes, not spurious copies)
for a few dollars apiece, but a supply of new power-transformers or the
Sprague triple-decoupling capacitors would be worth their weight in silver.

Sure John, if you just want to *float* a battery across a power supply
that's almost big enough, and if your duty cycle of transmit to receive
is low enough, a car battery is fine. Though it is a rather ungainly
filter capacitor. What our poster wanted was information on *running*
a radio off a battery.

2828. TM-741 IDer for crossband

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-29 13:24:22 UTC
From: dbushong@wang.com
Message-ID: <bp0l8n.cra@wang.com>
Source record: 289252

I'm working on a design that will allow the TM741 to partially
ID legally during crossband operation. I'm curious to know
how many people might be interested in duplicating the circuit.
If there are enough, I'll make a PC board design.

This would plug in between the mic and the mic jack. It will
ID on the output freq (the one that you are remotely listening
on) and requires you to ID vocally in the other direction. It
should be around 10 or 20 bucks for parts.

*** NOTE *** I'm not offering to supply kits for this, only
the design and possibly a list of sources for parts!!!

Please reply via e-mail; I'll summarize and followup when the design
is complete. Design suggestions are certainly welcome, by the way.

Regards, 73,
Dave

Usually. One out of two, avoid the charger. Sometimes.

Most aftermarket battery packs are fine, few aftermarket chargers are good, though some are very good and very expensive. Duckies, mics, earphones, charging cables, etc are usually *better* from the aftermarket, though not always.

Some Icom parts may be overpriced, like DC cables, or not of the highest performance standard, like duckies, but they *are* generally *reliable*.

>them down or outright shrink-wrapping it.

Bad idea. The nylon has a different dielectric constant than air. You will be guarranteed to have a coil with the wrong inductance. Even if you wind the coil differently to compensate for the different dielectric constant, nylon isn't a particularly good material to use in a transmitter tank circuit. Like many plastics, it gets hot when exposed to RF.

A quick way to check materials to see if they are suitable for use in an RF field is to chunk them in the microwave oven. If they don't get warm after a couple of minutes, they'll do fine. If they make a nasty mess in the bottom of the oven, you didn't want to use them anyway. :-)

That is really good to know. I am curious as to what you think
of the following procedure for using simple equipment to determine
if your amplifier is plagued with parasitic oscillations.

*** Please note that the following remarks are not about ensuring whether
*** emissions meet FCC criteria for purity of emission but instead to judge if
*** the parasitic osillations are significantly affecting the amplification
*** stages.

I have built hf qrp rigs and the issue of parasitic oscillations
always comes up. I do not have a spectrum analyzer or a high enough
frequency oscilloscope and so I use the following heuristic procedure
to determine the presence of significant parasitic oscillations.
Essentially I use a RF probe (a circuit for an RF probe is in Section 25 of
the ARRL Handbook) to measure rf voltages directly and through
a hi-Q filter tuned to the frequency of interest. In this fashion I
contruct my own frequency selective voltmeter. Large differences in voltages
measured thru the filter and directly (no filter - just rf probe) indicate
the presence of rf energy at undesired frequencies. Do note that you
can make the measurement fairly accurate by calibrating the
filter by use of a clean signal source (my stn rig).

Other clues to existence of parasitic oscillations:
- efficiency of the stage estimated by measuring the power output and
dc power in (of course the class of the amp matters here)
- temperature of the final transistor
- if you are examining the final stage, the rf voltage at the either end of
the filter (do note that you have to take into account any differences

in input and output impedances of the filter.)

I also had a problem with getting the tx oscillators to the correct
frequencies. After much analysis and a call to Ramsey it became clear
that the crystals had wrong load capacitances. Ramsey recommended
changing the feedback in the colpitts oscillator by adding a 10pf cap in
parallel with the cap at the emitter of the oscillator transistor. That
fixed the problem for both the basic and the 5Khz offset oscillator.

2835. Radio System - Columbus/Canfield

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-29 14:55:09 UTC
From: NELSON_M%athena@leia.polaroid.COM
Message-ID: <9205291454.AA23539@ucsd.edu>
Source record: 289256

On Wed. the 27th there was a posting here from a gentleman named Tom who was looking for a reliable radio link method for the 172 mile distance between Columbus and Canfield, OH. I have some comments for him -- having done a slightly longer link, and being a former resident of Canfield -- but don't want to tie up the net. How can I reach him? The "From:" line at the top of the message was not helpful (it read "cis.ohio-state.edu!magnus.acs.ohio-state.edu!tsquicqu@uunet.uu.net").

Thanks.

From: mostler@omega.sim.es.com
Message-ID: <1992May29.152744.25741@javelin.sim.es.com>
Source record: 289258

Could someone please post the internet address for the new callserver that
replaced Marvin. Our machine is not able to resolve
callsiogn.cs.buffalo.edu. , so
I need the actual address.

Thanks.

2838. cross-band repeaters, legal?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-29 15:56:51 UTC
From: n9gbj@n9gbj.ampr.ORG
Message-ID: <35698@n9gbj.ampr.org>
Source record: 289259

I still don't think that the cross-band repeater can be effectively IDed by keying up on one of your output frequencies and IDing. That only IDs one of the frequencies being used by your radio. Its the dual-bandedness of the thing that is confusing people. 2 frequencies are being used, so 2 frequencies have to be IDed. What if this was a single 2M HT and I key up and ID on 145.46, for a QSO on 145.52. (And don't worry, I'm not about to call up the FCC and ask them about all this! I already know what the answer to every question is going to be ;).

Consider a hypothetical cross band repeater linking a 2 meter repeater to a UHF frequency. The owner is out in the yard (if applicable), sitting in a hot tub shaped like a giant 2M HT, listening to the frequency on a UHF handheld, the cross band repeater is in the house. Every 10 minutes, the owner keys up, and "IDs" the cross band when it has operated in the last 10 minutes (does this bother the users of the repeater who are chatting away about where they are in their cars, by the way?). The owner is close enough to the cross band repeater itself so that we don't have to worry about the "control" or 10 minute transmitter timeout problems at all; its right there! Sure, they would have to get out of the tub, but they could run inside and shut the thing off if needed.

Meanwhile, 10 miles away, people are hearing the UHF side of the link. It is never IDed. This, I think, is the problem. They can't hear your HT even if you do use it to ID. (I don't want to deal with the "is it legal to ID a transmitter with another transmitter of much lower power on the same frequency"; makes my head hurt to think about it).

On another note, maybe there is a way to use these cross band machines legally. (how about this?) If you are trustee of a repeater, or if you get the trustees permission, couldn't you add your crossband machine to the repeaters "network diagram" as a remote base or something? Then the repeaters ID itself would take care of the pesky ID problem; it would just be running under the license of the repeater trustee; just like a remote base or link would. If one ever used the cross-band repeater to talk through the real repeater, one could ID the thing properly "this is N9GBJ on the KA9ABC remote base" and take care of the other side of the link. Maybe just asking the repeater owner(s) if it is OK for you to set up your remote base when you want to, and having them accept the responsibility for that transmitter might be the solution to the problem. You would be a "dep-u-tized control op", responsible for that transmitter; making sure it didn't lock up or transmit indecencies or be used by criminal elements to order pizzas or some such. It certainly isn't OK to just add the transmitter without asking and assume that it will fall under the repeater owners license,

of course.

2839. Questions about RX mixer problems

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-29 16:29:00 UTC
From: news@gvl.unisys.com
Message-ID: <1992May29.162900.25084@gvl.unisys.com>
Source record: 289265

How do I cure receiver mixer crossmod/intermod problems?

I am experimenting with a simple superhet receiver design to become part of a QRP transceiver for 20 meters.

Basically the receiver is working pretty good but when the band is "wide open" the mixer seems to be suffering from severe overload and/or intermod. I get a lot of "crud" in the background -- especially if the antenna coil is not tuned exactly to 14 MHz. If I tune it to either side of 14 MHz, the 20 meter signals go way down and the crud comes way up.

I am using aprox 3.5 Mhz IF. The crud is not IF feedthrough. I noticed if I disable the LO I can hear lots of crud (TTY, CW, misc garbage) in the background. It seems worse if the antenna coil is tuned to around 15-16 MHz or 9-11 Mhz. I figure that most of this "crud" is from the strong broadcast stations in these bands.

The mixer is a single 40673 MOSFET using a standard circuit in the handbook/QRP articles. LO level is about 3V pk-to-pk. My theory is that any two signals in the 9-18 MHz range that are 3.5 MHz apart are mixing to produce the crud I hear in the background. Depending on where exactly the RF/antenna coil is tuned determines which "band" of crud I hear. When the bands are not all that 'hot' these out of band signals are reduced in strength enough that the crud is gone.

The antenna coil is a single tuned toroid (T-50-2) transformer. The antenna side is a 2 turn link. The secondary is about 30 turns with 50 pf variable cap. It is connected directly to G1 of the MOSFET mixer. It seems to tune fairly sharp and I would think it should provide enough out of band rejection. I tried using 2 tuned circuits (loosely coupled) and it did not make all that much difference.

The only other thing I can see is somehow signals are getting from the antenna into G2 of the MOSFET. If I touch my finger to G2 the crud gets real loud -- especially when I have the LO turned off.

I would think that a simple MOSFET mixer with no RF amp should be able to handle the kind of signal levels that we are talking about coming from a 20 meter dipole. A 20 dB attenuator seems to cure the problem but most of the weak 20 meter signals go away too :-(

One night I got really desperate, and I tried replacing the mixer with a NE602. Signal strength was down considerably but the same background crud was still there.

Any ideas on what I am doing wrong? Am I expecting too much from
this kind of mixer?

2840. TS140S => homemade mic

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-29 16:39:01 UTC
From: jeffh@ludwig.uoregon.edu
Message-ID: <1992May29.163901.8648@nntp.uoregon.edu>
Source record: 289261

Netters,
I built a simple electret boom mike as articled in 73 about a year ago. The problem I have is that after the audio drops out the xmitter keeps keying on and off at approx .5 sec intervals. I've disassembled the standard hand mic and can't see any differences in the wiring. No matter how I adjust the vox the problem continues. Any ideas?

Thanks in advance,
Jeff Hite KF7SZ

I recently obtained a KENWOOD TH27A 2 meter HT.
When using the KENWOOD filtered Cig. lighter cord with the HT in the high power mode (5 W), the back of the HT is noticably warm to the touch.

Is this a normal condition?

Thanks in advance.

Source record: 289268

Hello,

I know that there are millions of these babies out there! You may not know that you have one because of their appearance. It looks like a large 5 gang condenser with coil(s) mounted on top. It appears like it would have come out of an old WWII vintage receiver but it has the marking MB40 on it.

Please check your junk boxes.

I would like to use one in the grid circuit of my 4-400 RF deck. Prefer it in a useable condx and by no means need it be mint or even nice looking.

Would like to trade for it, if possible.

Thanks,

Russ Ochsner, KA2KFH
ROCH000@SLUMUS.BITNET

Users will discover that many radios with cross-band repeat capability have their PL decode feature implemented at the audio output stages and will not prevent the cross-band repeater from being keyed by non-PL signals on the local link frequency or even intermod. The current Yaesu and Kenwood models are in that category, I believe.

Can anyone give examples of radios which they are sure (I think or It should type answers need not apply) will use PL decode to prevent the actual keying of the cross-band repeater (not just supress the audio output)?

> Can somebody tell this newcomer how the callsign server works and how to
> access it, or how to get this information?

Attached is the description from this group's FAQ. It's a bit out of date
(my copy, I mean) but it should get you started.

> Thanks!

No problem. I should know better than to post something about the server
without explaining it!

Devon

If you are at an Internet site you can connect using telnet to one
of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.2)
ham.njit.edu (currently 128.235.1.10) (alias plan9.njit.edu)

The servers sit on port number 2000 which is a different port number
than what telnet usually defaults to. So if you just telnet to these
machines, you will get a login prompt instead of the server. How you
tell your telnet program to connect to port 2000 instead of the
default port is operating system dependent but it is usually done
with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, consult your local systems guru for the proper
command string.

The interactive servers are designed to be somewhat self-explanatory
and they support fairly detailed help facilities. The first command
you should execute when connecting to one of these servers is "info".
This will list general info about that server and how to use it. You
should then type "help" to list the various commands available.
Typing "help" followed by a command name will give you a little more
detail about that command. Servers allow searches by call, last name,
zip code or city and also provide regular expression filters to trim
your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty
Carruth, N7IKQ. This database currently contains US and Canadian
callsigns and it does not contain club calls. A new version of the
database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com.
In the body of the text, say "lookup" followed by callsigns you want
to look up. If your mailer appends signature files, you should put
a line "quit" at the end of your request (before the signature file).
If you want help, put the word "help" on a line by itself. Here is
what a request might look like:

```
help
lookup kc1sp wn4bbj
lookup n0fzd
quit
```

If you are a packet radio station, callserver data is available from
REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns,
separated by spaces. Body of message is ignored. The server is an
OS interface to the MBL packet BBS using the Buckmaster CD-ROM
callsign database.

2858. Modulating a PLL.

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-02 21:38:15 UTC
From: andyw@aspen32.cray.com
Message-ID: <1992Jun2.163815.1645@hemlock.cray.com>
Source record: 289135

I am about to design & build a small FM transmitter. It will consist
of a PLL, locked to a crystal. I wish to use FM modulation. It appears
to me that I have 2 alternatives :-

1. Modulate the frequency reference (eg the crystal).

2. Modulate the feedback signal, after the LPF & before the VCO.

It would seem that my choice of modulating technique will determine
what the response of my LPF needs to look like (ie what damping
factor to select). Choice 1 seems to imply that the VCO needs to
track the crystal closely, choice 2 seems to imply the opposite.
Am I thinking along the right lines ?

Is there a good rule of thumb for the response of the LPF, given
a maximum modulating frequency ?

I wish I'd paid more attention at college now :-) :-)

We lost 2 of the 5 MHz that we used to *share* with Land Mobile.
Now we have the other 3 MHz all to ourselves. IMHO, *all* of 3 MHz is
better than *1/2* of 5 MHz. Remember: Use it or lose it.

>
>73 de oh2mbm

From the April 1992 issue of TAPR Packet Status Register:

TAPR/JAMSAT TrakBox Kit $185.00

The TrakBox is a self-contained, standalone accessory for use with satellite stations. You simply select the satellite you wish to track from a front panel control, and the TrakBox will steer your antennas in both azimuth and elevation to track the selected satellite when it is near or above your horizon.

In addition, if you have a radio with a computer interface, the TrakBox will tune your transmitter and receiver and correct them for doppler shift.

TrakBox includes a serial port to allow you to set the real-time clock (which is battery backed), your station location (latitude, longitude, and elevation) and the keplerian elements for the satellites you are interested in (up to 40 satellites may be loaded, and the elements may be uploaded in ASCII in either the AMSAT or NASA formats). Once set up, TrakBox no longer needs to be connected to any other computer to operate.

TrakBox includes a two-line LCD display showing the azimuth and elevation of a satellite, along with the satellite ID and GMT. The display is updated every second.

TrakBox is set up to directly interface to Kenpro, Emmoto, and Yaesu dual-axis rotors which include a computer interface. It may also be interfaced to other rotators as long as simple relays (mechanical or solid-state) are added to the rotator control box. It has been tested with the KR500 elevation rotator and the CDE/Hy-Gain series of azimuth rotators (HAM-M, HAM-II, HAM-IV, TR-44 and TailTwister styles).

The radio tuning mode has been tested with Yaesu FT-736, Kenwood TS790, and ICOM 970. It is designed to handle any ICOM radio with the CI-V interface (IC275, IC475, IC1275) as well as the Kenwood TS-711 and TS-811 models. ICOM radios with the older CI-IV interface can be used with an accessory convertor available from ICOM.

Note, I have only read the article but it seems like a good addition
to the hamshack to me..

I tried the 250 Hz filter in a IC745. I found it to be unsatisfactory.
The passband isn't flat enough and the cross distorted. Dual 500 Hz
filters in conjunction with the passband tuning works better.

>diode, photodiode, bolometer, or other similar device.

You are correct of course. The point remains that the lidar detector
is not more sensitive and *selective* than conventional lower frequency
microwave detectors using preamplification and superhetrodyne conversion.
Special cooled CCD detectors are very sensitive, but not very selective,
and are easily overwhelmed by bright sources.

> When is the discussion on lidar jamming/spoofing going to begin?

I haven't had a chance yet to take one of these jewels apart, but it
appears that they use tone tagging of the beam to avoid being confused
by ordinary lights and solar reflections. A bright IR source with tone
modulation should confuse them nicely, and not even require a license.

That's right.

>That's true when you're talking about current TV technology. If you're talking
>about HDTV, though, the rules may well change - especially if they wind up
>occupying most or all of that 6 MHz channel with lots of RF, unlike the
>current spectrum.

Since the FCC is intent on maintaining *compatability* with existing
NTSC receivers, the waveform for HDTV is very little different from
the waveform of existing TV. The ACT system does fill some of the
spectral holes in current NTSC waveforms, but remains similar in total
spectral power. It's still basically vestigial sideband AM. The systems
using augmentation channels are falling out of the running, but have a
totally normal NTSC main channel and a separate digitally encoded
augmentation channel. *That* could be a nuisance if it fell in the
repeater portion of 440 MHz. In broadcast tests at WRC, the main
channel was broadcast at VHF and the augmentation channel used an
open UHF channel. The MIT system is currently undergoing testing
and I don't have much information on it yet.

Here is the schedule for the Australian Pirate broadcaster Radio G'day.
The operator Claude Crow will verify all correct recption reports sent to
P.O Box 3474,
Boroko,
Papua New Guinea.
The primary frequency for the June &th broadcast is 11412Khz however if there
is bad interference then 11400Khz will be used.

June 7th.
1100-1300 UTC East coast USA
1300-1500 UTC SE Asia
1800-2100 UTC Europe (shortpath)

June 8th
0000-0200 UTC on 15040Khz beamed to West coast USA
0600-0930 UTC on 11412Khz " " Europe.

To help with QSL it may be a good idea to include one US$.

Best Wishes From Sunny Sydney,
Joe,
University of NSW,

The "11th Hour Contest Group (north american chapter)" will once again be operating from the northern edge of EN33. This is a relatively rare grid and we have an excellent site. Last year we worked into EN72, 62, 60, 70, 64, 50, and EM57.

We will probably use the call KA0VYB and we will be operating on the following bands:

6m, 2m, 1.25m, 70cm, 23cm, and 3cm(10ghz)

I will do return QSL's. If you need this grid, look for us.

Tell all your friends and teach them what that SSB button is for on their multi-mode FM 2m rigs ;-).

73's and good contesting

+While doing some tower work the other day, an interesting question
+came up. Another licensed amateur operator was operating my base
+2 meter rig, under my station license. I was up the tower with my
+HT. In theory, how should we ID. Both using my call would be
+confusing, but would it be correct for him to use his call on my
+station ? Please respond direct, since I only get to this group
+occasionally..... Thanks.....Dave Chasey -- wn9nbt@ecn.purdue.edu

Ah, but your friend was borrowing the unit, so it wasn't your
station anymore. He should have used his call. Were you at the
control point for your base when you were up on the tower?

>I'll get for the car is the Pro-2025, which covers 29-54, 136-174, and
>406-512 MHz.

Kevin,

If you know exactly what you want to scan, the 2025 would work fine in the car. However, it doesn't have search capability, so it will be of limited usefulness in finding new frequencies or scanning individual bands. Scanner World offers a BC400XLT (same as RS-2025) with AC adapter, back of the unit antenna, DC cord, and mobile mounting bracket for $100US. Don't overlook the BC100XLT handheld, for around $160US you get basically the same as the Radio Shack Pro-35 (minus 108-118 MHz). If you go for the 200XLT ($240US from SW) there is a simple mod to restore cellular coverage.

Hope this helps.

Dave
dmh.wbst129@xerox.com

PS - Popped open my new RS-2023 (for $99 I had to buy it...) and found it's a uniden. Haven't found any mods for it yet, but I'm looking. Also, while I'm here, anyone know if there is a way to get the Bearcat 200XLT to cover 108-118? I'd like to get the local airport ATIS at 110MHz.

2877. Re: GB2SM

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-03 15:43:12 UTC
From: hugh_davies.wgc1@rx.xerox.COM
Message-ID: <".3-Jun-92.15:43:34.+1".*.hugh_davies.wgc1@rx.Xerox.com>
Source record: 289140

<...
In 1977, when I visited the RSGB station in the London Science Museum
(GB2SM?) on a fine Sunday afternoon, it was active and a crowd was
gathered around to see it in operation.

In 1983, there was one operator on duty and he seemed a bit annoyed at
my visit. I was the only visitor at the time.

In 1988, the station was unattended, dusty, and had a sign on the
counter telling interested people where they could write for
information.
...>

Hmmm. Firstly, you must realise that the station in the Science Museum is not an "RSGB" station, much less the HQ station. The RSGB HQ station is at the RSGB headquarters in Potter's Bar, about 20 miles North of London (and possibly worth a visit). I suspect the Science Museum station (which, to my eternal shame, I have never visited) is run by members of a local radio club, and suffers from the usual problem of getting volunteers to do anything on a regular basis. On the occasion I visited the Queen Mary in Long Beach, and operated the station there, I was told that this was the first time that the station had been open for "several weeks", so perhaps they suffer from the same problem?

Out of interest I called the RSGB, and they had no information about GB2SM other than the phone number of the Science Museum. I called the Science Museum, but the station was unmanned (!) and the guy who knows about it unavailable. Perhaps you have a point . . . .

<...I wonder if the station will even be there...>

I hope so. I suspect that much of this is due to the steady de-glamourisation of Amateur Radio in the public eye. If no-one wants to come and look at GB2SM, why should anyone bother to go and operate it?

From: CRAWFORD@ritchie-emh1.army.mil
Message-ID: <9206031228.AA29028@nic.ddn.mil>
Source record: 289128

Is anyone using an HP Deskjet 500 to print QSL labels from DXBase?
I am having a problem with the printer starting too far down the
paper. I think it should start printing at 1/2" but it actually
starts at 5/8". This results in the last line of the label
overwriting the edge of the label. Unfortunately, when I took
the printer back to the dealer and they checked with HP,
they said:
- there was no adjustment for where the paper starts printing
- printer working properly because the other printers they
have started in same place (I watched them test it on their
demo machines).

Any experience or ideas? Anyone know of someone at
HP I can contact through the Net?

I am not on distribution for INFO-HAMS, so direct
response would be appreciated.
Thanks, Jerry K7UPJ

03JUNE92 @ 1230 hrs EDT 1730 hrs GMT

All you new people, like me that are waiting on your new ham license, I took my test and qualified for a license on April 5, 1992. The head VE said that he was going to review the applications and tests to be 100 % sure of accuracy. He also said that when me mailed them in on Tuesday April 7th it should be 6 to 8 weeks until I receive my ticket from the FCC.

**********BULL CRAP**********

I just Called ARRL and did talk to a very nice Switchboard operator and she connected me with another nice lady who advised me that MY application was received by the FCC on April 27th and that it would be 6 to 8 weeks from then <4/27> that I should receive my license.

I have seen others posts here on this net stating the same thing, 6 to 8 weeks from the time you test till you should receive the ticket. One guy announced, about 2 weeks or so ago, he got his in 5 1/2 weeks. Come on, what gives?

I called the FCC at Gettysburg also, "NO LICENSE HAS BEEN ISSUED TO THAT NAME AND ZIP CODE." Zip.Code. What does that-----Oh skip it.

I'm glad that is off my chest but I'm still *********. <to evil a word to use here>.

My new target date to receive my TICKET is now June 22, 1992 per ARRL <and I wanted to try to up grade to General Sunday> I know I can but.... its called SHOWING OFF......Ever done it? Sure you have.

As usual, the latest issue of QST has *ANOTHER* QRP rig
you can build.

Is anyone else sick to death of seeing QRP rigs in *EVERY*
issue of QST?

How many different kinds do you have to publish?

Does anyone actually build this things?

I'm thinking about writing a letter to the editor and
ask them to collect the last several thousand "QRP rigs
you can build", and put them into a book - then stop
printing them in QST!

Does anyone else feel this way?

P.S. - I need to replace my Doug DeMaw voodoo doll: there's
no more room for pins...

>issue of QST?

I guess things run in cycles. Before I was a League employee I used to be so mad at the League HQ staff for virtually ignoring QRP. This is certainly a different twist of fate. :-).

>deletions

>I'm thinking about writing a letter to the editor and
>ask them to collect the last several thousand "QRP rigs
>you can build", and put them into a book - then stop
>printing them in QST!

BTW - we have done just that. The book is called "QRP Classics." As for the letters, please do! I think the most difficult part about working at HQ is that we often have to work in the dark. Most people just don't bother to write or call. Even the flamer letters are appreciated here (in an administrative sense, anyway. :-)). I urge those of you who feel strongly about anything to make your views known. A letter to the editor will get directed to the appropriate person here. You should contact your Division Director (see page 8 of QST) about any of your concerns or ideas about ARRL policy matters. We really will have a better idea about what you want if you tell us!

Thanks for the post. I consider one who voices a criticism to be a potential ally. At least I know how much you care! 73, Ed Hare.

>Does anyone else feel this way?

*----
You sure make it sound like an urban legend. The plasma-bulb could
probably have been derived from Tesla's experiments. But I don't see
how it would have been practical to make it 20 years ago. Who wants
a light bulb that needs tubes and a HV power supply to run?!

Now the miniature circuitry fits in a standard mazda lamp base. That
makes it a lot more practical.

Not I. The more the merrier. :) I would like to see the trend continue.
There are people like me who like to build and use qrp rigs.
So a vote to continue the trend of including a qrp rig article in
each issue of the QST.
>
>How many different kinds do you have to publish?

As many as possible. I have built ones similar to the ones they have
recently published. I am looking forward to different ones.

>
>Does anyone actually build this things?
>

Not exactly the same but similar ones - YES.

>I'm thinking about writing a letter to the editor and

This all seems to depend on the particular VE and supporting
organization that handles your licensing.

A friend and I took our exams one week apart in different locations in
this area. We received our tickets one week apart, eight and a half
weeks after taking the tests.

Novices (like the poster who reported a five and a half week wait) I
think get to send their paperwork directly to the FCC and save at
least one full step in the process.

But I don't believe a person on an HT in San Antonio would really be able to hit any of the aforementioned repeaters since it is more than 100 miles away :)

I suggested using the West Texas Connection which is piped in via phone/microwave lines from all over west Texas, including San Antonio.

I dont have the San Antonio frequency handy, though... had it earlier this morning.

There are already several, yet they keep coming up with new twists!

Seriously Tony, how many different things are there left in ham radio that the homebrew enthusiast can build? By your call, you probably started about the same time that I did (ex WA1NUK), when there were all kinds of things that could be modified on existing rigs to improve them, when Heathkit still made buildable, well designed kits (unlike today. See, for example, the Ramsey thread). Things seem to have changed today. Commercial rigs cost ***MUCH*** more than they used to and you would have to think more than twice about going into one to modify it. Hell, you can't even buy a rig that lets you dip the plate current any more!

QRP and antenna design seem to be the last bastions of homebrewing in ham radio. Sure, I'll probably get flamed by the ATVers and the satellite enthusiasts, but I don't know anyone who would disagree that ham radio has become an appliance operator's hobby.

A recent letter in QEX spoke to this same issue. Without homebrewing the average ham does not even understand the basics of how the radio works. QRP is the easiest way to get into homebrewing and, if nothing else, certainly teaches how the thing works.

I have a friend who is a relative newcomer to ham radio (1 year). I won't embarass him by printing his call, although, if I know him, his response to this will be right near mine on the net. He did not know much about radio when he started studying for his exam but in the year of falling in love with CW, building antennas and QRP equipment, he puts many of us old timers to shame.

>73
>tony - WA2EAA

Please don't consider this a flame, Tony. It's just the empassioned plea of an old timer in ham radio to keep as much homebrewing in the hobby as possible.

2891. RE: New Light Bulbs.

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-03 18:52:20 UTC
From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <2387@wb9mjn.ampr.org>
Source record: 289152

Hi, Boy is there allot of hype going on in the press about this old tech-
nology! The Chicago Tribune had a glowing editorial about these RF powered
flourescent bulbs. I put it that way, because i think the people promoting
these things, are doing everything in their power to present these bulbs
to the public, without the word "flourescnt" entering the discription. But,
that s all these things are, with an induced RF power source, instead of a
AC current power source.

Does the world really need a couple billion little Radio transmitters spread
around? Compact Flourescents seem to work well, Oops, there s that dirty
word again, the FL word. There is one in my house, and i have not to date,
detected any spurious signals on my 440 and 2 meter rig, attributable to it.
The advantage to the E-lamps seems to be longevity. But is a doubling in
longevity worth the significantly greater EMI and RFI possibilities ?

In my experience, RF heating technology can effect VHF and UHF communications.
In the Chicago area here, we have a 220/9600 baud link. One of the nodes ,
in Gurnee, IL, is close to a factory, which uses RF heating technology. The
spurious emmisions from this equipment slews across from 150 to 400 Mhz,
according to the site owner, during its operation. Presumeably, this is
equipment operating in the 27 Mhz ISM allocation.

I found out about the RF heating equipment, only years after our link had been
in service. We knew there was a problem, but since it wasn t clear what the
problem was, it was made to look like our link equipment was somehow flawed.
This perception was distributed thruout the region, and is partly responsible
for the Chicago area not having high speed links outside the area by packet
radio, even tho we had some of the first applications of this techonology,
up and running, on Ham Radio.

This is a bit off the main topic here. But, RFI is no simple thing to be
ignored, as one of the other persons making comments on the new light bulbs
is implying. It IS a real problem, with many unforseeable and insidious
effects on the future usage of the Electromagnetic Spectrum. Altho , maybe
a bit far feteched to most, it seems to me, that RF heating RFI seems to have
had a certain impact on Ham Radio application of RF FSK technology, because
of its effect on a key project. While, there was also a real SOB of a person
using the link, just at the right time of the day that the RF heaters were
turned on, who hollered far and wide, it was the RF RFI that was the root
cause of the link outage, and the consequent discrediting of 9600 baud FSK
in the midwest, outside the Chicago area. Without regional support for the
project, there was no national support, with no national support, 9600
baud FSK was basically reinvented in England, from which it has been hailed as
the great improvement that it is.

Also, I read these bulbs use Mercury. Do flourescents use Mercury? Mercury is not something to be playing around with, if it can be avoided. It can be as bad as Lead, in its effects on the body. Somebody double check me, on this, i only know this from anecdotal experience.

|> Ah, but your friend was borrowing the unit, so it wasn't your
|> station anymore. He should have used his call. Were you at the
|> control point for your base when you were up on the tower?

No, I really wasn't loaning him my station, I was granting him permission to operate it, being a fixed base on my antenna. When you operate a United Nations station, Smithsonian, W1AW, Queen Mary, etc you are operating their station license and use their call. This was the same mode as we were operating under. I realize this is totally acedemic, trivial, and all, but we were just curious about "what's technically correct" as opposed to "socially acceptable".

2900. GE Master Executive II as a repeater?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-03 19:59:25 UTC
From: spell@seq.uncwil.edu
Message-ID: <1992Jun3.195925.13424@seq.uncwil.edu>
Source record: 289158

Hello everyone,

Has anyone had any experience converting a ge master executive
II vhf telephone transmitter into a 2m repeater?

If anyone has any advice on how to do this, I would really like
to hear it. I've been told that it is possible, but I would
like to talk to someone who has done it before.

I'm new to all of this (still waiting for my license to come in
the mail) so I welcome any help I can get. I never
thought about putting a repeater up until I went to a hamfest
with a friend of mine who wants to put a repeater up. He
started looking at ge transmitters so I asked him if he could
use the ge transmitter as a repeater. He got excited when I told him I
had one sitting at the house doing nothing! I knew it would
come in handy one day if I kept hanging on to it. :-)

Chris

I called Intersource Technology of Sunnyvale today with a few questions about the RFI/EMI issues raised on the net. I spoke with a Mr. Tom Moore who is apparently some sort of spokesman` for the company.

He told me that the frequency of operation is 13.56MHZ as has been reported here already. He also told me that the oscillator is crystal controlled and so is unlikely to be drifting up and down the spectrum. `

When asked about spectral purity of the RF, he really didn't have a lot of hard numbers, but what he did say is that the devices would be compliant with "part 18 of the FCC regulations". Not being an expert on the FCC regs, I don't know offhand what that means.

When pressed a bit more for specific details
he stated that the only harmonic that had been troublesome was the 4th harmonic which he said would potentially interfere with TV channel 4 (I thought channel 4 was much higher in frequency than that, but that's what he said). Anyway I asked him if they had any techincal reports that showed the emitted spectral power density etc, and he said that they didn't have at the moment, but would have in the near future.

I asked him what proportion of the power applied to the device resulted in light, what proportion was heat and finally what proportion resulted in RF emissions. He didn't have all the numbers, but would say that 40% of the energy was converted to light. He also said that the input power was 23 to 25 watts.

He said that American Power, one of their big investors, has been very concerned about the RFI/EMI issues and before investing, had thoroughly evaluated the technology to make sure that it was OK from that perspective among others.

I also told him of the discussions on the net in the radio newsgroups and suggested that if someone there was on the net, that it woould be a good idea to have some postings explaining to we tekkie types what their position is on the RFI/EMI issues.

I guess that we will have to wait to see if someone from Intersource will post.

I'm so sick of the US media hype! Is it this bad in other parts of the world? When I first heard about this revolutionary light bulb, I could have sworn a new element was discovered to make it possible. Getting rid of the electrodes will probably increase it's lifetime, but gee wiz, it must have been a slow news day.

It can't now be more than a month since the news media tried to terrify us by letting us know that halogen lamps are bathing us in dangerous amounts of UV light. "Buy only those lamps that have a glass shield over the bulb", they said. Another slow news day. Please don't tell them how the fluorescents over their desks work! We've had costly experience here with wire insulation damage due to UV from ceiling fluorescents.

They aren't all QRP rigs, some of them are QRPp.

Hey lighten up, QST is well balanced. The QRP articles are balanced with the bicycling articles, hill climbing, kyacking, sailing, league meetings, IARU meetings, editorials, ads, etc. The only thing missing are REAL technical articles. The kind that document the amateur pushing the "state of the art", the kind that Ham Radio Magazine was centered around.

Oh, how I miss HR Mag.

(maybe more) there was an article on how the ARRL made CW practice
tapes. i'm interested in getting a copy of the article. any help
appreciated. i'll go to ARRL after HAMCOM, if i don't get a reponse,
it's just that i want to get FAX'ed copy yesterday. :-)

i am interested in generating practice tapes for 40 wpm and above
without thumps, clicks, etc. at one time there were a set of reel-
to-reel tapes for tape speeds up to 80 wpm. anybody remember those?
anybody care?

>monta@image.mit.edu (Peter Monta) writes:
>> Are there junk bands in the HF, a la 2450 MHz, for
>> this kind of thing? Does the discharge generate wideband noise?

Yes. Same set of rules as microwave ovens. (Part 18.)
6.78 MHz +/- 15 kHz
13.56 MHz +/- 7 kHz
27.12 MHz +/- 163 kHz
40.68 MHz +/- 20 kHz

Part 18 does have my favorite phrase in all the FCC regulations I've read.
"Paragraph 18.305 (a) ISM equipment operating on a frequency specified
in Paragraph 18.301 is allowed unlimited radiated energy in the band
specified for that frequency."

For RF lighting devices, consumer grade, the emission limits (outside the
unlimited band) are (all measured at 30 Meters): 30-88 MHz - 10 uV/M,
88-216 MHz - 15 uv/M, 216-1000 MHz - 20 uV/M. Conduction limits into
the power line are 250 uVolts from .45 to 30 MHz.

>Is the thing at 27.255MHz, which is a HF ISM (junkband) right in the middle of
>the biggest "junkband" ever allocated! A much lower ISM is 160-190kHz
>where anybody is allowed to radiate one watt into a 15 meter antenna or the
>equivelent amount of RFI.

Two different categories. The RF lamps would operate under Part 18,
Industrial, Scientific, and Medical Equipment. 160-190 kHz (1750
meter band) operates under Part 15, Subpart C, Intentional Radiators
(along with several other bands with other power and use limitations).

The difference is that under part 18, you can use all the power you
want (with approved equipment), but are not allowed to telecommunicate.
You can do whatever you want under Part 15, but are only allowed to
use limited power. (1 Watt Input power for 1750 meters.)

13.56 MHz is also a Part 15 band (not very desirable, now ;-( ), with
a very low power limit. (10,000 uV/M at 30 Meters, which I computed
out at only a few milliwatts).

Unlike Part 15 which has exemptions for hobby use, equipment for
ISM use has to be approved.

According to the FAA, you may bring almost any electic or electonic device aboard a commercial craft, but you may not energize, receive, nor transmit without the express permission of the captain. And the captain must follow all company rules concerning the use of these devices.

Personal experience says to put the HT in your checked baggage. I've travelled in and out of the US, and they won't let you use the radio of a walkman, and most often will not allow you to use your HT.

Making a bulb glow in the presence of HF excitation dates back
to Tesla (at least). If there is some aspect of such a lamp that is
patentable, it must be VERY minor.

It would be possible to RF-shield such a lamp with transparent
tin oxide, or even to make a coil geometry that has very little
far field (so the RF energy is concentrated inside the lamp... which
is the only place you WANT to dump that energy). Making such a lamp
cheap and reliable is possibly not as easy as it seems; the ionized gas
is VERY corrosive in such a discharge.

I only made the point on the patent aspect, besides 20 years ago solidstate power circuits were practical. This might also be a modern use for a vaccuum tube, a very simple power oscillator. The HV could simply be like the front end of a switcher ie 300V. It has been long known that operating a flourescent lamp at a high frequency produces over twice the light and will last much longer than twice the 50/60Hz life. If you don't believe me try it!

>
The Zenith "Spectrum Compatable" system encodes the video into a QAM signal
which is band-limited to fit into existing 6 MHz channels. One of the
benefits of this approach is a *reduction* in co-channel interference.
This is because the energy of the QAM signal is centered within the channel,
unlike NTSC or PAL which have large energy peaks near the edges of the
channel.

Message-ID: <9206040101.AA13188@ucsd.edu>
Source record: 289187

Mea Culpa! Since my last post on the FTR146 transmitter tuning, I have discovered a grave error in my kit building. I used a 5/16-18 bolt instead of a 3/8-16 bolt as a coil form. This was somewhat precipitated by the confusing instructions in the manual to use a 3/8-18 bolt as a coil form. (Next time I take the manual to the hardware store.) A quick calculation shows that the inductances end up 20% with the 5/16" bolt. Amazingly, the transmitter still tuned up to about 4 watts.

Anyway, after the replacing the coils, the transmitter tuned up to 5 watts output with very little trouble. I was able to get about 6 watts out, but had to back off a bit to keep the first harmonic within legal limits. L16 had very little effect on the power output. L17 and L14 had to be tweaked slightly for best output. L15, the inductor on the coax connector, had to be spread to almost twice its original length to both increase output power and decrease the first harmonic. The only other spurii noted were a pair of 3.5 MHz spikes about 70 dB down off the fundamental frequency. These are from the PLL.

Other nitnoids noticed after starting operation: The squelch is rather abrupt and has a very noticeable delay after loss of carrier. I will probably have to alter some time constants to fix this problem. The power supply filtering leaves a lot to be desired in mobile operation. I will have to add additional filtering to the power supply leads before putting it back in the car.

Despite the problems, I still think the radio is a good deal. I enjoyed putting it together and am looking forward to the modifications I intend to do to the rig. BTW, I wired up 12 channels using the supplied switch. You can use the rear hole that normally supports one end of the 8v diode switching line to support another set of diodes for a second channel. Then solder that second set of diodes into vacant holes or to the existing diodes for two channels per programming row on the board.

SB QST ARL ARLB051
ARLB051 UPS GOES CELLULAR

Because of delays in gaining access to frequencies in the 220-222
MHz range United Parcel Service has taken steps to utilize cellular
telephones for some of its package-tracking data services.

But the company has not abandoned its plans for eventually using
220-222 MHz (which was reallocated from the Amateur Service last
August), according to a UPS official. UPS is frustrated by the FCC
delays and simply can't wait any longer, the official said.

UPS has contracted for three years of cellular service and plans to
replace the cellular equipment in their vehicles with 220-MHz
equipment later, should they get the necessary FCC license.

The interim solution will be expensive - money that UPS could have
used to build their 220-MHz system. And the cellular system will
not have the capacity to track all UPS's shipments and will in most
cases be limited to tracking overnight deliveries.

SB SPCL ARL ARLX020
ARLX020 PUERTO RICO EVENT

Beginning now and continuing through November three special events
stations were scheduled to operate from Puerto Rico, in conjunction
with the GRAND REGATTA COLUMBUS '92 - Fifth Centennial. According to
the Puerto Rico Amateur Radio League, an ARRL Special Service Club,
more than 300 tall ships will be in Puerto Rico in June, and a
number of social, cultural and sporting events are scheduled.

Word of this activity was not received in time for publication in
June QST. It will appear in the July issue.

Three official amateur stations were planned: one from the capital
San Juan, one from Aquadilla near the site of the Columbus landing,
and one from the U.S. Coast Guard cutter Eagle which will be
participating in the event.

Certificates will be available to amateurs contacting the two
Official Stations KP4/500, one in San Juan, as well as the KP4/500
station onboard the Eagle, and at least four KP4, NP4 or WP4
stations located in Puerto Rico.

Contacts must be made during the period May 20th at 1600 UTC through
November 20th, 1992, at 0400 UTC. Primary suggested frequencies are
3897, 14250 and 21325 KHz. Secondary frequencies are 7297 and 28497
KHz for SSB as well as 10106, 21063, and 28063 KHz for CW.

2934. QST and QRP

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-04 07:02:26 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <01GKTM4X4WO0FN4CR8@TNTECH.BITNET>
Source record: 289112

Well boy am I glad that QST has articles on QRP... I haven't built any yet...but I save the magazines for the day I will.

There are sections in the magazine that I am not particularly interested in ... so I either skim them or skip them... I read QST at least twice each month... I have subscriped to many magazines in my day (skiing, R/C modeling, CQ). Never found one that even comes close to being as good as QST... and QST is really almost for free.. considering all the other services the organization provides along with a great magazine.

I belong to the AMA (Academy of Model Aeronautics). I think the current dues are $40/year. For that you get insurance in case you hit someone with your plane and a magazine.. Never found ANYTHING worth reading in that magazine and look through it and throw it away the same day. I feel most of the money goes towards an elite few flyers that get the most of the benifits... so what am I trying to say...

1. I love QST.. I think it is the best magazine I have come across and look forward to reading it each month and save my copies in case there is something I want to go back and build or a product reveiw I want to look up

2. Never known anyone to read every page of a magazine

3. Anyone narrow minded enough to think that a magazine should change its contents to suit each individual so that they won't have to skip a section .. probably doesn't comprehend the contents of the journal anyway

Well guess I have might right to my opions.

What's "ISM" stand for?

-joe

Industrial, Scientific and Medical. There are several bands where you can operate almost any RF gear, e.g. RF heaters, those darn lamps, etc.

Besides the already mentioned frequencies at 13.5 and 27 MHz your good ole' 902...928 MHz ham band is an ISM band. There you can find also spread-spectrum computer LANs in addition to all other species of ISM RF garbage generators.

At 2450 MHz (+/- something) you have microwave heating equipment. It is an ISM band, too. As is a part of the 5.7 GHz ham band.

I have lost my copies of the ISM bands found in the ITU RR book (Radio Regulations). If somebody here has the book, I think the netters would be interested in seeing the complete listing of ISM bands.

2937. Boston Area Field Day QTHs

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-04 09:22:10 UTC
From: w1gsl@athena.mit.edu
Message-ID: <1992Jun4.092210.24461@athena.mit.edu>
Source record: 289205

The following clubs have sent me Field Day information for
inclusion in a possible Boston Globe article. They all invite
the public, many would also welcome operators. Because several
USENET readers asked for the list I am also posting it here.

The second line of each listing is the contact person or my source
when available it will not appear in the news paper article.

If your club is not listed there still may be time to get in the article,
act quickly E mail me w1gsl@athena.mit.edu I am particularly interested
in clubs in NH and RI. Remember no guarantees it is only a possible
article and I have no idea how much room we will get.

NB: This is an invitation to the public, Provide an address they
can find.

BTW thanks to all who contributed to this list.

Message-ID: <9206040951.AA26882@ucsd.edu>
Source record: 289206

The discussion on 'Too much QRP in QST' is interesting. I have always wondered why 'QRP' is assumed to imply (a) HF-bands, (b) CW, and (c) simple equipment. Surely a 5-watt 2-meter FM HT is 'QRP' too? And what about the Gunnplexer microwave enthusiasts? They are definitely QRP, but transmit data, FSTV, voice.
I have no personal interest in HF or CW. So when i see 'yet another' QRP transceiver project, i probably dont even bother to read it, because theres only a very slim chance that it will be anything other than HF CW!.

With the availability of surplus cellular phones, what about someone writing up a 'QRP Spread-spectrum 200Kbps transceiver for under $100' type project? Now *that* i *would* read!

>The Zenith "Spectrum Compatable" system encodes the video into a QAM signal
>which is band-limited to fit into existing 6 MHz channels. One of the
>benefits of this approach is a *reduction* in co-channel interference.
>This is because the energy of the QAM signal is centered within the channel,
>unlike NTSC or PAL which have large energy peaks near the edges of the
>channel.

This is the point I was making: I'm not interested in co-channel interference, but rather interference to others who use narrowband frequencies *within* the channel where the energy density is low. If you redistribute the energy within the channel, those folks suddenly get *lots* of interference, unnecessarily shaking things up. I would strongly recommend that HDTV experimentation take place *above* 450 MHz. For that matter, I'd like to see current NTSC ATV move above 450, too...

>
I have been searching for the 'headset' or some sort of attachment to
place on my SCUBA regulator to allow a microphone to be used. The reason for
this is that I want to experiment with underwater communications. If you (or
anyone) has a spare unit of this type, I would be willing to trade the use of
one for access to my results.
I was trying to do this inexpensivly (as this is a personal project and has
no funding), and was thinking of trying to modify one of the 'Aquavox' units.

The Aquavox was a device that replaced the mouthpiece of the regulator to
create a voice box. The voice box coupled to the water to allow for short
distance sound transmission. The problem with the unit was that the distance
sound travelled was VERY small, and people had trouble hearing the things
while wearing wet suit hoods.

Does anyone have an old Aquavox that they would like to part with cheap?
Or any other similar device.

Rich

2944. KH6 <-> W6, a reply

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-04 12:14:29 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9206041215.AA08702@cmr.ncsl.nist.gov>
Source record: 289209

Regarding the posting and questions from K6ZH.....
Jim,
The 2-meter SSB/CW beacon and contacts you heard the evening of June 2 were almost surely tropo ducting. All the previous 2-m contacts over this path have been laid to ducting. It would take double-hop Es - a VERY rare event on two.
Yes, the KH6 <-> W6 path IS special. Something to do with cool water vs. warm air temperature. (An abrupt drop in atmospheric moisture [dielectric constant] at some altitude). A similar path exists from southern France to North Africa.
Ducts or inversions are observed over continents - but the maximum range is about 2000 km, then you run into to mountains or no moisture.
There is also a Texas <-> Florida path that works at 2-m and above. It usually doesn't reach far inland.
Just an incoherent reply-----

73, Bob W3OTC (Jim, Sorry, I've lost your e-mail address.)

We have been suffering from intentional interference on our local repeater for several months. Eventually we got around to turning our fox-hunting efforts in that direction and we quickly found who the culprit is. He turned out to be a licensed ham who seems to have only one way to deal with anyone who doesn't agree with his views.

Our local club sent him a letter explaining that we would forward our findings to the FCC if he continued his interference. He continued and we carried through. Our information is that he should be receiving his 'administrative' letter from the FCC today or tomorrow.

In the past, this individual stated that "No one, including the FCC could make him stop interfering if he didn't want to." (By the way, we didn't remember this comment until after we knew who it was.)

Has anyone else had this sort of problem and want to offer a solution?

> We (NN7N, 2A, WWA) used CT 7.(something) last year. We used a couple of
> laptops (one was a Zenith 286). We separated the stations by about 200
> feet, which was just about as much RS-232 cable as we had. I think we
> used shielded cable for the entire run. We really

We're planning to use CT during the VHF contest next weekend, so I enjoyed your report. In experimenting with 2 computers, I think I had trouble with the power saver mode in the laptop. It shuts down the hard disk and then has to spin it back up to respond to serial link info. I'm hoping that disabling this feature (we're on AC anyway) will prevent this. The symptom was simply that the laptop quit talking to the other computer. I restarted CT on the laptop and both worked fine.

Any other experiences with CT on serial links and laptops?

My first experience with Quement Electronics amateur department
this last Saturday (May 30) was an unhappy one.

Before visiting, I had called to verify the existence in stock of
the IC 2410H. After being transferred to the amateur department,
the (unidentified) salesperson said "yes: we have that model in stock."
I asked again to make _sure_. before making the trip out.

He said, definitely, "yes."

As you can guess, when I got there thirty minutes later they were
out of stock and they had no idea when they might be getting more.
"But they did have a demo model that, although cosmetically..."

Moreover, the three salesmen all denied ansering my call.
Further, the manager, Javier Montoya, said "I can't beat it out of them!"
when asked by me to solve this mystery.

Because of the nonplussed attitude of the management and workers, I am
led to believe that this is a policy of Barney Quement's people -- if not
explicitly, then by default.

For an amateur who is was willing to pay Quement's higher-than-HRO's prices,
this is a very strange policy. Naturally, I will never visit Quement again,
for any reason -- at least HRO makes an effort to be helpful, even if out of stock.

Amateur Electronic Supply will continue to get my money. No state taxes, either.

I am in the process of writing a book chapter for James Walker's upcoming book, The Remote Control Device in the New Age of Television. My chapter is on the historical growth of television remote control devices up to the present, and the factors that both stimulated and retarded the growth of TV remotes.

Data on remote control growth (whether via television set sales, VCRs or cable television) is difficult to uncover. I need the help of anyone who may have been involved in the television, VCR and/or cable TV equipment industries. If you read this and are not the right person but can lead me to others at, for example, RCA, Zenith, etc., please pass along any names to me. I am also interested in interviewing any pioneers at (or retired from) any of these companies who may have helpful insights into the history and growth of TV remote control devices.

Thanks, in advance, for any leads, remote control growth statistics, or any other help you might be able to offer.

I am looking for advice.

Background :

I am about to retire and cost is a consideration in any decision
I make.
I have a "homebrewed" 286 12Mhz that "turbos" to 16 Mhz. It has
4 Megabytes on the board Plus 2 Megabytes Expanded on an Intel
Above Board. 40 Megs of Disc with only 1.5 Megs left.

I am running windows 3.1 with Procomm for Windows. I run "single
thread", have not "multitaksed" since I got off the IBM mainframes
a number of years ago. I also have WordPerfect for windows up.

Most of my use will be for keeping records (marks, test, etc.)
for a couple of courses I teach ("c" language, Operating systems)
at a Community College at night. Additionally some family (budget)
etc type work, hooking into Compuserve, Prodigy, etc. Also a
further (possibly prime) use is to interface to my amateur radio
equipment for packet, RTTY, and Slow Scan TV.

My question -- I am planning to add 80 or 120 meg of disk storage
for sure *BUT* what do I get by paying $300 plus to upgrade, as has
been suggested by my son, to a 386 25Mhz with 8 Megabytes on the
mother board.

I know about 386 enhanced mode and permanent swap discs and
386Maxx, etc. but am not sure what they will give me *THE WAY
I USE THE MACHINE*.

WHAT SHOULD I DO TO SPEND MY MONEY WISELY??????

Sorry to be so long winded. Please reply via e-mail so that
band width can be kept down.

All standard disclaimers should be applied at this point.

>issue of QST?
>How many different kinds do you have to publish?
>Does anyone actually build this things?
>I'm thinking about writing a letter to the editor and
>ask them to collect the last several thousand "QRP rigs
>you can build", and put them into a book - then stop
>printing them in QST!
>Does anyone else feel this way?

I like construction articles much better than boring DX lists. At least QST prints construction articles. I agree to an extent that I'd like to see something besides one watt CW rigs for HF. I'm currently playing with a 2 meter FM transmitter/receiver based on the Motorola MC2833 and MC13135 chips. Without Communications Quarterly I wouldn't have known that these devices existed.

On the other hand, my introduction to power MOSFETs came through one of QST's QRP construction articles. Now if someone would point me to a simple article explaining how to *properly* use the VHF/UHF power bricks that take 10 mw in and put out 5 watts, I'd love to hear about it.

Few people actually seem to be building these days, but given convienent access to the parts via a kit, such as the Ramsey, lots more people are willing to heat up the soldering iron. Complex projects without a parts kit are only intellectual exercises for most readers, so the QRP articles continue to pour in because it's much easier to scrounge a few parts than hundreds. Still, complex projects do stimulate the imagination and I'd like to see one once in a while. I'd also like to see articles that stress modulation methods other than CW. With cheap DBM, MMIC, and GASFET parts abounding, much more interesting projects could be described and still kept simple enough for the average home builder.

Most of QST's technical content comes from reader projects, so if you want to see more interesting technical articles, *write some*. Some potential topics include;

1) a 3 chip 2 meter HT,
2) a time compression multiplexed single channel duplex repeater, (I'm working on this and the 3 chip RF deck is just part of it),
3) a single chip SSB generator,

4) simple DBM and MMIC based linear transverters,
5) a FM ATV modulator/exciter,
6) a FM ATV receiver,
7) a tutorial on designing and using fast PIN TR switches,
8) a tutorial on building your own high performance cavities,
9) a tutorial on *properly* using brick amplifiers as output stages,
10) tutorials on proper station installation and protection.

Well there's a top ten list for budding QST authors to start chewing on. I'm sure lots of other topics strike your fancy, these are just my current hot buttons in no particular order.

Rumor has it that they are crystal controlled, though that seems unlikely. From the descriptions I've seen, they use an 8 turn tank coil in the bulb to excite the gas. I suspect you could just break the bulb and link couple an antenna to this tank. Unlike an incandescent, the coil is not a filament and shouldn't be harmed by exposure to air. I don't know if you could rubber the crystal 400 kHz up into the 20 meter band or not. I suspect the RF module is potted and changing the crystal would be difficult to impossible. If you ganged 40 of these bulbs together, you could have a nice kilowatt signal on 13.56 MHz though, provided the coupling would cause the bulbs to sync lock.

Industrial, Scientific, Medical. ISM devices are used to seal plastic bags, run proton magnetometers, and as patient diathermy machines among other things. They are used primarily, but not exclusively, for heating materials that can't stand direct flame application.

> Now we have the other 3 MHz all to ourselves. IMHO, *all* of 3 MHz is
> better than *1/2* of 5 MHz. Remember: Use it or lose it.

We used to share with the *government*, not with land mobile, and now that the 3 remaining MHz is "exclusively amateur", it will be just that much easier for someone to grab.

Since the government was a *very* infrequent user of the band, it was a defacto 5 MHz that we used, and we had some "protection" from easy spectrum grabs since the government was shown as the primary user. That's why it took so many different proposals over the last 12-13 years (remember the 220 MHz CB, garage door opener, TVI, Inc, 220 FM broadcast band, etc., etc. proposals?) before somebody hit on one that was politically palateable, and, of course, somebody who could come up with the bucks and the lobbying clout to pull it off.

I'd much rather have it the way it was, with sharing with the government and have the 5 MHz, instead of the "exclusive" (for the time being) amateur allocation.

Looks like you swallowed the scam that was perpetrated on the amateurs hook, line and sinker!

2959. Heathkit History

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-04 14:14:13 UTC
From: steves@batman.SanDiego.NCR.COM
Message-ID: <1992Jun4.141413.25840@donner.SanDiego.NCR.COM>
Source record: 289081

The following is an article my mother sent me about Heathkit from the Chicago Tribune (Sunday, May 3, 1992). I hope some of you find it enjoyable. Has anyone ever seen (or flown) a Parasol?

Pulling the Plug

By Ron Grossman

ST. JOSEPH, Mich. - A factory here is shortly to become the Wailing Wall of a now-graying generation of nerds.
In reveries of adolescence, our thoughts will return to this resort town on Lake Michigan's shores, about 75 miles northeast of Chicago. For decades that nondescript industrial building was home of Heathkit, which made it a fairy castle to every man and boy who ever dreamed of becoming a new Thomas Edison or Guiglielmo Marconi.
Women remember the Heathkit phase of American history differently, given that 90 percent of the customers for the company's line of electronic gadgets in kit form have been males. Many a wife and girlfriend spent the 1950s and '60s wondering why the man in her life preferred cuddling up with a soldering iron and a bunch of vacuum tubes to taking her out for an evening of dining and dancing. Other women spent the era hectoring husbands to finish the FM radio or television set whose half-assembled components cluttered basements and closet shelves. Their daughters will suffer none of that.
Alas, Heathkit is no more.
William E. Johnson, president of Heath Co., has announced that it will no longer produce its do-it-yourself product line. Once the factory's remaining stock of Heathkits is exhausted, electronic putterers and garage and workshop inventors will have to find alternative outlets for their creative juices.
Actuarial tables, Johnson explained, dictated the decision to abandon the kits in favor of concentrating the company's energies on its highly successful line of consumer electronic products. With each passing year, the Grim Reaper takes away an increasing proportion of the customer base for Heathkits, while the shifting mores of young Americans prevent the company from finding sufficient replacements.
"Do your kids have the patience to sit down and build their own stereo set over the course of several evenings or a weekend?" Johnson asked. "Mine don't. They want to buy one at a store, so they can listen to it the very same day."
But to lots of males born before the age of instant gratification, a stereo or radio was not just a source of

entertainment. In kit form, it also provided the even sweeter music of what Johnson calls the "Eureka Complex."
It was an experience Johnson himself never tasted before coming to Heath as a marketing director about 30 years ago. He didn't think of himself as particularly handy. So he was skeptical when his boss suggested that the best way to get a feel for the company's products was to take a kit home to build.
"My neighbor laughed when he saw me sitting at the kitchen table assembling electronic parts on a circuit board," Johnson said. "But I was so excited when I finished, I pounded on his door at midnight to come hear a transistor radio I'd made with my own two hands."
The afterglow of such a personal triumph is long lasting, Johnson added, noting that he went on to assemble more than 200 more Heathkits. The little curl of smoke that rises from a soldering iron as it joins resistors and condensers can induce an intoxicating habit.
So Johnson wasn't surprised by the results of a consumer survey he once commissioned. The consultant firm he hired reported: "You don't have customers. You have evangelical loyalists."
"The consultants also said they lost money working on our account," Johnson recalled. "They were used to spending about 15 minutes on each customer interview. But Heathkit fans would talk their heads off for an hour or more, pointing out the virtues of all the TV sets and weather monitors they had built over the years."
H. L. Parrish, who lives in Newland, N.C., built his first Heathkit, a $20 shortwave radio, in 1948. When he recently phoned in a $285 order for Heathkit's super-accurate electronic clock, the factory's order taker broke the news to him that this project would be his last.
"Tell you the truth, I've lost count of how many Heathkits I've built," observed Parrish, 65, an insurance premium auditor. "But for many years there, I built every new kit as soon as they put it in their catalog."
Johnson noted that Heathkit's partisans came from all walks of life. Former Sen. Barry Goldwater, a long-time amateur radio buff, has assembled 75 to 100 kits, Johnson reported.
"One Christmas, Sen. Goldwater built six of our Trashmasters to give as presents," Johnson said.
Given such loyalty, Johnson dreads having to sit down this June to write his customers a Dear John letter. In it, he will tell them they will no longer receive the catalogs through which the company periodically announced wonders of modern electronics available by return mail in kit form.
Time was when lots of American households measured the passing by arrival of the Heathkit catalog. Spring, summer, fall, and especially as Christmas drew near, the postman would deposit in their mailboxes a 100 page brochure with colorful

renderings of families gathered around a big-screen projection TV or a pinball machine that Dad had built. A 1983 catalog cover showed the proud parent of a Heathkit robot diabolically grinning at the electronic slave he had just wired together.

For awkward adolescents of yesteryear, the Heathkit catalog was a kind of electronic-age equivalent of the Book of Psalms: something to be read in moments of despair and discomfort. When word of the Heathkit's demise started seeping out, a number of long-time fans called the factory to express their regrets, notes company spokeswoman, Paula Hancock. Some recalled how they used to take the catalog to high school dances.

"They explained that they would bury their noses in the Heathkit catalog," Hancock said, "because they were to shy to speak to girls."

The Heathkit's origins can be traced back to the dreams of Ed Heath, perhaps the ultimate partisan of the do-it-yourself philosophy of life. A barnstorming pilot in the early days of flying, he founded the Heath Airplane Co. in a factory on Chicago's Sedgwick Street in the 1920s. There he designed a small, affordable airplane, which he christened the Parasol.

"Heath sold both fully assembled planes and kits for folks to build in their garages," Johnson said. "Some customers would but their Parasol a wing at a time, for say $100 each, until they had all the parts necessary to get their airplane up and flying."

In fact, Heath's kits were assembled by thousands of amateur aviators across the country. But in 1931, Heath died in a test flight crash. Shortly afterward the federal government enacted strict regulations governing home-brewed aircraft, which bankrupted the company. Its surviving assets were moved to Michigan, where the company was acquired by Howard Anthony in 1936 for a few hundred dollars. Anthony added two-way radios to Heath's airborne offerings, and the company's fortunes improved during World War II when it got government contracts to produce airplane parts for the military.

One day shortly after the war, Anthony got a call from an electronics parts dealer who was helping to liquidate the government's surplus stocks. Sight unseen, Anthony agreed to buy three box-car loads. Then he rushed to his banker to borrow the money he needed to consummate the deal. When the railroad cars arrived at his factory, Anthony found that among the other gadgets he now owned were 1,000 oscilloscope tubes.

An oscilloscope displays the mathematical curve corresponding to a given electronic circuit, which makes it an invaluable diagnostic tool for repairmen and technicians. At the time, an oscilloscope tube sold for $50 or more. But Anthony had bought his for about 50 cents each. That allowed him to package a tube plus all the other components necessary to build an oscilloscope and sell the lot, along with a schematic diagram of how to assemble the device, for $39.50 each.

With minimal advertising, this first Heathkit was an

overnight success upon its introduction in 1947. So Anthony began packaging additional sets of electronic parts that could be assembled into other testing devices and amateur radio equipment. Within three years, the company was selling $4 million worth of kits a year. In the 1970s, when the catalog included some 400 kits and accessories, sales of Heathkits topped out at about $60 million a year.

By then, the simple diagram of the early kits had been replaced by elaborate manuals that walked a Heathkit builder through the process, step by step. Those manuals also explained to novices the theory underlying the gadgets they were assembling and, eventually, Heathkit developed a line of laboratory-quality kits designed to demonstrate basic electronic principles. Widely adopted by American schools, those kits helped upgrade the teaching of science at the secondary and college level.

Heathkit also established a telephone consultation service, so that the stumped constructors could share their frustrations with a technician at the factory. Heathkit's much-trumpeted motto was: "We will not let you fail."

That parlay of quality parts and shared know-how enabled even rank amateurs to construct cutting-edge electronic equipment. In the 1950s, the tinny sound of prewar phonographs gave way to sophisticated amplifiers and speakers labeled "high fidelity." Stereophonic sound was introduced, and TV moved out of the laboratory and into America's living rooms.

Heathkit's customer often were able to build such equipment long before their neighbors could but factory-produced versions in department stores. When computers were still massive, big-bucks items that only corporations could afford, Heathkit was offering a do-it-yourself version powered by vacuum tubes.

Clifford Burr, who lives in Kenmore, N.Y., built a Heathkit color TV soon after the networks began transmitting in color. "When I finished, I was so excited to see color TV, I lugged the chassis upstairs without even mounting it to the cabinet," the 77-year-old Burr said. "I turned the set on, and my mother-in-law thought I was a genius."

When he recently learned of Heathkit's impending demise, Burr went around the house taking inventory of the kits he had built. At 100, he stopped counting, says Burr, who built kits not just for his family's pleasure, but also to equip a TV repair shop that he operated.

When he retired about 15 years ago, Burr gave away his oscilloscope to a young friend with a passion for electronics. Built from Heathkit's first kit, that oscilloscope was still in perfect working order after 27 years of continual use on Burr's workbench.

Burr wasn't the only one to start a business with Heathkits.

A few years back, the Heath Co. wanted to cook up a deal with Digital Equipment Corp., a leading computer manufacturer. Wise in the ways of the corporate world, Johnson expected to be put

off initially with a my-people-will-get-back-to-your-people runaround. Instead, he soon found himself in the office of Kenneth Olsen, Digital's founder and chief executive officer. "Olsen said he was grateful for what Heathkit had done for him when he was just starting out in the 1960s," Johnson said. "Olsen explained he had had only a limited amount of funds. So he took half his money and built Heathkits to equip a laboratory for his fledgling company."

In the end, Heathkits fell victim to the same rapid progress in electronics that initially made them popular. Early Heathkits were powered by vacuum tubes whose filaments cast an eerie orange light on the builder's hands. Their components had to be connected, piece by piece, so that their chassis seemed stuffed with spaghetti-like masses of electrical wire.

But vacuum tubes have long since given way to transistors, and printed circuit boards largely have done away with hand wiring. A single electronic chip is now the equivalent of the dozens and dozens of resistors and condensors that used to fill a Heathkit builder's workbench to overflowing.

In recent years, many kits required only minimal assembly, thus robbing their constructors of the Eureka Complex that an earlier generation of Heathkit fans experienced. So young people no longer get the kick they once did from building a shortwave radio and hearing voices from across the oceans, notes H. L. Parrish, the North Carolinian who used to assemble kits as fast as Heath's engineers could design them. Today, an adolescent with a taste for high-tech adventures is more likely to become a computer hacker.

"I can't see the kick of staring at a computer screen," Parrish said. "To me, there is no excitement like that of plugging in a radio you've just built, then seeing those vacuum tubes begin to glow just a moment before the first sound comes out of the loudspeaker."

>be as bad as Lead, in its effects on the body.

I don't know what's in fluorescents; the RFI bulbs (:-) contain mercury vapor. The pressure in the lamps is presumably extremely low; I bet in full production they go through an ounce of mercury a year at the factory. Mercury, in sufficient doses, is incredibly toxic, but these bulbs probably won't be able to deliver a dangerous dose even if you ate one.

The bulbs probably consume about 15W or so, so they aren't QRP :-). Also,
you'd need a stiff harmonic filter, since they presumably don't have to worry
about harmonic purity as long as no harmonic radiates more than the FCC limits
for the given frequency...

In article <9206030908.AA06396@ucsd.edu> P.Lucas@unixa.nerc-swindon.ac.UK (Pete Lucas) writes:

Maybe hams should start a scare-story about the 'hazards of exposure to RF radiation' from these new RF-excited bulbs. Given the almost total lack of understanding of the difference between ionising and non-ionising radiations among the masses, and their irrational fear of the word 'radiation', consumer fear could be put to our advantage....

By banning ham antennas in neighborhoods because they "radiate".
Good idea...

They said (in a press conference excerpted on CNN) that they have several basic patents in the works; they probably didn't patent making gas glow with RF (though with today's patent office, you never know), but they may have patented all of the tricks that result in a practical lamp.

tonyp@convex.com (honey bunny) writes:
>As usual, the latest issue of QST has *ANOTHER* QRP rig
>you can build.

Thank you, ARRL.

>Is anyone else sick to death of seeing QRP rigs in *EVERY*
>issue of QST?

No. I am sick of contesting, though.

>How many different kinds do you have to publish?

I do wish they'd publish a simple design for 15 meters.

>Does anyone actually build this things?

Yes.

>I'm thinking about writing a letter to the editor and
>ask them to collect the last several thousand "QRP rigs
>you can build", and put them into a book - then stop
>printing them in QST!

They have published that book. The next edition can carry the newer articles
that work really well. If they keep printing them in QST, they can continue
to have up-to-date designs available.

>Does anyone else feel this way?

God, I hope not. You may be content to just sit and yack at a toaster, but
I'm not.

Richard, could you call back Mr. Tom Moore and ask him about the device's susceptability to RF (not just generation). I'm much more concerned about lighting up a neighbor's house when I'm on 20 meters than I am about the bulbs causing interference in my house.

Channel 4 might be impacted by the 5th harmonic of the 13.56 MHz oscillator.

rossi@gvlf8-m.gvl.unisys.com (Pete Rossi) writes:
>I have heard the term "QRP RECEIVER" used often. What is that
>supposed to be? A generic term implying a simple receiver? Is
>"simple" supposed to imply 'low performance' too?

I haven't heard the term, but it could mean several things; the most obvious is "a receiver you can build in the same weekend that you build the matching QRP transmitter". Other meanings could be "will last a long time on battery power due to careful design", or "has nowhere near enough buttons compared to this brand-new, $8000 commercial DC-to-daylight scanner." Or even "OK, it doesn't perform terribly well, but if you actually look at the schematic while building and using it, you'll *understand* how it could have been better, and might even be motivated to build it again with improvements."

Maximum performance usually comes at the expense of quite a bit of complexity, but simplicity does not need to imply a lack of attention to performance.

2971. Help with Kenwood TS-830S

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-04 15:10:59 UTC
From: sieh@ie.engr.wisc.edu
Message-ID: <1992Jun4.101059.24180@doug.cae.wisc.edu>
Source record: 289223

I am a EE grad student in UW-Madison. I passed my novice exam last week,
and am in the process of getting my first rig. From my question below,
you will see that the beginning of my ham career is more complicated than
I thought.

I recently purchased a used TS-830S radio. Last night I tried it out with the
help from another ham. I was disappointed to find out that the radio
was putting out only around 20 Watts on all bands (into a dummy load).
We tested all three vacuum tubes with a tube tester, and found the tubes
to be good. The receiver works normally. Hence we think the radio is
out of alignment. Are we correct?

If I decide to realign the transmitter to achieve the normal output power,
how much work will it be? If it's not too troublesome please describe the
procedures. (Is it the "drive coil adjustment" described in the service
manual?)

Another question: Did Kenwood use GE tubes in their TS-830S?
The owner of the radio claims that the GE tubes currently in the radio are
the original ones of the TS-830S.

Thanks in advance for your reply.

P.Lucas@unixa.nerc-swindon.ac.UK (Pete Lucas) writes:
>The discussion on 'Too much QRP in QST' is interesting. I have always wondered
>why 'QRP' is assumed to imply (a) HF-bands, (b) CW, and (c) simple equipment.

Probably most QRP enthusiasts are interested in building the equipment themselves, therefore they would favor simple (I can barely scrape together a few hours every other weekend), which generally implies HF (especially if, like me, one is still learning proper construction techniques) and CW. I have seen QRP designs that offer VHF and voice, but they are (of course) more complicated (and, of course, UHF designs generally are transverters for full-featured 2m rigs, which I don't have). When I am more confident of my ability, I'll start trying them. It's easier to learn on HF.

>Surely a 5-watt 2-meter FM HT is 'QRP' too?

It certainly qualifies by power, but the QRP-operation enthusiasts might argue that there is no challenge in just working those repeaters you can hear without any scratch in the sound (attempting to set a distance record on simplex, however...).

>And what about the Gunnplexer microwave enthusiasts? They are definitely QRP,
>but transmit data, FSTV, voice.

Generally they use all the power they can get ahold of; "QRP" by necessity hardly counts :-).

> With the availability of surplus cellular phones, what about someone writing
> up a 'QRP Spread-spectrum 200Kbps transceiver for under $100' type project?
> Now *that* i *would* read!

"Why break out the diagonal cutters to do that when you can just buy a much better appliance to do the same thing (for more money, of course)?" That famous anti-HF-QRP argument (which, thankfully, you didn't trot out) cuts this way, too.

(On the third hand, if the Pegasus launcher manages to gain popularity, maybe we can start seeing QST articles entitled "Yet Another Personal MicroSat"...)

Here are the ISM frequencies. The source is an OMEGA
Engineering wall chart that we have hanging in the lab.

6.78 MHz +/- 15 kHz
13.56 MHz +/- 7 kHz
27.12 MHz +/- 0.163 MHz
40.68 MHz +/- 0.02 MHz
915.0 MHz +/- 15.0 MHz
5800.0 MHz +/- 75.0 MHz
24.125 GHz +/- 125 MHz
61.25 GHz +/- 250 MHz
122.5 GHz +/- 500 MHz
245.0 GHz +/- 1 GHz

Can not wait for the first light bulb to QRP rig project.

>only a very slim chance that it will be anything other than HF CW!.

I second the motion, it`s time the QST (ARRL) gets it in they`re head that there is more than HF CW. It would seem that the ARRL gives HF CW QRP more than it's share of coverage. I mean how many QRP 20 meter CW rigs do you need?

>With the availability of surplus cellular phones, what about someone writing
>up a 'QRP Spread-spectrum 200Kbps transceiver for under $100' type project?
>Now *that* i *would* read!

Since you can get a 900 Mhz QRP FM TV transmitter for $50 from Walmart, why not an amplifier for truly low cost FM ATV (keep it under 5 watts and its QRP..). We are going to lose 900 Mhz, and probably 1200 Mhz in the next 10 years if we don`t get some activity there.

> Is anyone else sick to death of seeing QRP rigs in *EVERY* issue of QST?

The real issue is not that they are QRP rigs, but that they are *simple* rigs. QST wants to include construction articles for rigs that people can actually build. Time was you could homebrew a rig that was every bit as good as a factory built rig, or even better. Any moderately well motivated homebrewer could build the equivelent of a Drake TR-3 without much trouble. Today, homebrewers just can't build rigs that are equivelent to state of the art equipment. Nobody, not even the factory, could build a modern HF transceiver by hand; they were designed to be built by machines

on automated assembly lines. Imagine a QST construction article for a transceiver using surface mount chips, high-density, multi-layer circuit boards, three microprocessors, digital signal processing, and exotic system software. It would take months or years to build such a rig by hand, and it would probably end up costing a lot more than the factory built rigs. Now imagine a QST construction article on an SSB transciever with one VFO, no memories, no scanning, no computer interface, no digital readout

; just a basic transceiver; you could build one, but it wouldn't be worth the trouble -- the design is obsolete. So in its desire to include practical rig construction articles, QST presents rigs that are simple enough for ordinary humans to build, that are still desirable enough for folks to *want* to build; these days, those come out as QRP rigs.

Just my $2e-2 worth...

I would expect the major RF susceptibility weakness to be the oscillator tank circuit. Being that close to 20m (13.56 MHz), unless it's well shielded, it is likely to be an efficient receiver for your nearby transmitter.

Wonder whether the effect will be more pronounced with the lamp switched on or switched off?

Source record: 289084

Well..... I'm very surprised. Only *one* other guy agrees with me.

I've taken into account that in "the real world" it is the handful
of people that make the noise that get their way, but here on the
internet, where to voice your opinion only requires hitting an
"f" or "r" key I should get a very rounded base of comments.
I guess I did. :-)

Here's the way it went:

- old timers: There isn't much left that can be home brewed these
days. There aren't alot of parts places left. This
gives the novices a chance to build something that
is current. Heathkit is defunct. You've got to be
a PAKLED to find parts these days.

- new timers: I built one of those QRP rigs, and boy was it fun!.

- QRPers: I've built several of them, and each one was a blast!

- LID: [Various nasty words that have no place in Ham Radio]
Hey - what's a repeater without your local Ker-chunker?

Other comments were along the same line. Some people just like reading
about it, some like building 'em. Some like to look at the schematic and
decipher it - to learn more about RF.

One guy asked me what I'd like to see instead. I thought about it for
a few minutes, and here's what I've come up with.

o A TRANSMATCH. As good as my TEN-TEC job (will match bedsprings to my rig
with a 1:1 VSWR).

o A MONITOR SCOPE. Tx/rx monitor and maybe a 5 Mhz bandwidth for trouble
shooting. My SB-610 is about 20 years old, and will pack
it in one of these days. The only other one I've seen is
the Kenwood for around $899! Ouch!

o A TU. Terminal Unit. Something that will get you on RTTY easy and cheap.
With the active filters around these days it should
be alot easier to build than the old ST-6 kind.

o A CW rig for 2mtrs. Something running A-2, so that the Techs/Communicators
can get their code speed up.

o A KEYER. None of this Curtis 1-chip stuff: A *real* TTL version.

That's what I've come up with so far. Thanx for all the input.

>
>Any other experiences with CT on serial links and laptops?

Disabling the power saver mode should solve that problem. The disk
must be active during networked operation since CT writes each QSO to
disk. Of course, if the other station is not working anything then it
shouldn't matter....

We (K1TR/3 multi-op group) have used at least 2 laptops out of 5
computers for the last three years with CT. We have had no problems
that are related directly to laptops. Occasionally we lose QSOs
between the machines (think this is RFI related) but this is becoming
less of a problem with the use of shielded cables and software
changes. It helps to have K1EA and his development system along for
the weekend.....he provides software support on the side and operates
432 as his "real job".

>"Citizens Band" at what I think used to be a garbage frequency
>held for Diathermy and glue machines. The 4th and higher harmonics
>could really kill low band TV though.

I once had a monster RF generator from a dry chemical asher.
About 300 watts at 13.56 MHz to create a plasma in 6 chambers.
The manual mentioned that there was no license required for
13.56 MHz as it was a research and industry frequency with
no power limits.
The asher was in a grounded, heavy metal box and probably
didn't radiate much of that power anyway.

A similar device I saw at a flea market:
a box with 2" high glowing green letters.
The letters were sealed neon tubes coated inside with phosphor,
bent in the shape of the letter.
No electrical connections or electrodes - just RF excitement from
a coil behind the board.
It came with a box of letters so you can spell out whatever you wanted.
The board had ledges for 3 rows of about 12 letters each.
It wasn't cheap, but I've never seen them before or since.

I believe that there are neon signs that use RF excitation of the
neon tube. How else could one achieve the effect of
one end lighting and the glow "growing" to the other end?

When I spoke with Mr. Tom Moore of Intersource yesterday, he indicated that
the bulk of their patent activity has been in the implementation of the
excitation, and in reducing RFI/EMI. None of the patents he referred to
have issued, only the one covering the plasma technique which issued
a number of years ago as has been already mentioned on the net. He
didn't know when that patent issued, so it isn't clear how much
life it has left.

I love to read the QRP projects!

I have finished a few, and have bags of parts destined for others in the basement. One of
the projects has been "in progress" since 1984. My wife thinks I would save much money by selling
all my gear and parts, since most of my hamming time is spent reading articles and planning projects.

Still I'm sure it does get tiresome for the non-fanatics.

On a visit to Thomas Edison's winter home and laboratory in Fort Myers, FL, one of the guides told us that Edison designed that base. At the time, he was interested in Asian culture, and the term "mazda" meant something that appealed to him. Unfortunately, I don't remember the meaning.

I've always thought "mogul" base derived from the connotation of the word indicating "big" or "large." Mogul bases are, after all, pretty big.

The problem with mercury is that it is a cumulative poison. It is *very*
slow to be excreted from the body, so the more you are exposed to, the
sicker you become. Mercury poisoning is very insidious. Speaking of the
mercury content of "normal" flourescent tubes, I've seen a number of them
where you could actually see droplets of mercury rolling around inside.

I too would like to see the QRP article stay. I've built a few QRP rigs over the years and view QRP homebrewing as just about the only way an AR operator can go portable on HF (I don't think the Argonaut is very portable).

What I WOULD like to see, however, is an article or two on a VFO tuned, DSB suppressed carrier QRP rig. Don't tell me about how wasteful of power such a rig is; I already am aware of that. DSBSC is a simple solution to getting a voice signal on the air from a remote location cheaply. If an article did appear on this type of QRP rig, I'd build it in a second.

According to an Alinco spokesperson on CompuServe, I believe that the dial-speed adjustment was added to the firmware (or some such modification) on serial number 4000 and on. He didn't say anthing about the modification being done by Alinco on pre-4000 units.

>I suspect there are several different "models" of 580 on the market now.
>The FL/#123 incantation doesn't do anything to my old 580 (serial number 1732)

A couple of weeks ago, I informed the net of this feature, as it had
been shown to me by an Alinco rep at the Rochester, NY Hamfest on 16
May. Shortly after this, someone informed me that this didn't work on
their radio.

He made a call to Alinco and discovered that this does NOT work on
older DJ580's. However, Alinco apparently told him to send his radio
to them and they'd update it for free.

He didn't have any information regarding at which serial number the
radios started having this enabled.

Actually, I have always heard the 'standard' screw base refered to as an Edison base (as opposed to the Westinghouse single-pin bayonet base, the Thomson-Houston base with a female threaded hole in the base, and others).

Mazda (TM ca. 1910) lamps were named after the Persian goddess of light.

C7-1/2 and C9 bases are small versions of the Edison base (7.5 mm and 9 mm diameter respectively) used primarily on christmas and night light bulbs.

>missing are REAL technical articles. The kind that document the
>amateur pushing the "state of the art", the kind that Ham Radio
>Magazine was centered around.

Well. At the risk of violating netiquette, let me inject some facts into the discussion. Here is a partial list of technical articles that have appeared over the last 12 months in QST. I've selected each article based on my perception that it is state-of-the-art, or that it describes something that hasn't been covered in the amateur press, or that it is a solid technical treatment of a project or subject. Warning: not an HF QRP project in the list.

Jul 1991 A Single-Board, No-Tune 902-MHz Transverter
Aug 1991 A High-Performance, Easy-to-Build 432-MHz Transverter--Part 1
Sep 1992 " " " " " " " " --Part 2
Oct 1992 A simple VHF/UHF Diplexer
" " Match Bandwidth of Resonant Antenna Systems
Nov 1992 Computer Remote Control of an Amateur Radio Station
" " RF Power Amplifiers and the Conjugate Match
Dec 1992 Chiptalker
Jan 1992 A Receiver Spectral Display Using DSP
" " A Field-Strength Meter with Decibel Display
" " The FET Charge Controller
Feb 1992 Getting Started on the Microwave Bands
Mar 1992 Eleven Years of Sporadic E
Apr 1992 A Five-Band, Two-Element Quad for 20 through 10 Meters
May 1992 An Inexpensive, Easy-to-Build ESD Probe
Jun 1992 Easy Computer Control and Bandwidth Switching with Kenwood Transceivers

There may be other articles that would qualify for this list, but these are the ones I picked out in a quick scan. Considering that QST *does* have to cover the operating and news material, I think that's a pretty decent list. Could be better? Sure, but we have to work with what we can get. So, write us something better!

I think the current crop of complaints is because QST has been running a multi-part article called "Build it Yourself from QST." It's intended to help train the neophyte builder, and as an example project it is

focusing on a QRP transmitter. So while it seems like a lot of QRP projects, it's really only one project, and it's really subsidiary to the main point of the articles.

In fact, the only QRP (meaning simple HF receivers and transmitters) projects I can find in QST during the past 12 months have been this series of articles and Hayward's Junk-Box Receiver from June 1992. That doesn't strike me as excessive coverage of QRP! (Now, if you had made that complaint a few years ago I would have agreed with it.)

Remember, too that QST speaks to a general readership. As such, the technical level of articles is purposely kept reasonable. (No calculus!) But we do have a publication that has no restriction on the technical level of the articles: QEX. I can promise you that we will never reject a QEX article because it's "too technical."

>spectral power. It's still basically vestigial sideband AM. The systems
>using augmentation channels are falling out of the running, but have a
>totally normal NTSC main channel and a separate digitally encoded
>augmentation channel.

The FCC has mandated simulcasting for terrestrial HDTV broadcasting.
As a result, systems which use augmentation of a regular NTSC signal
(including ACTV) have been eliminated from the running. The waveform,
being digital, will be nothing like the waveform of existing NTSC
signals. (I have ignored the one analog contender, which I believe has
very little chance of being chosen).

HDTV will be broadcast independently on its own 6 MHz channel and will
not be compatible with NTSC receivers. Existing NTSC channels will
remain unaffected until their phase-out (around 2008, if the FCC gets
its way).

Initially, both formats will coexist. Each TV station will simulcast
the same programming on its NTSC and HDTV channels. Eventually the
NTSC broadcast will be turned off, and the channel will be reused for
HDTV (obsoleting the NTSC receiver).

The FCC plans to announce its selection of HDTV system next February.

From: lyndon@ampr.ab.ca
Message-ID: <59@ampr.ab.ca>
Source record: 288980

I'm all in favour of construction articles, however the constant barrage of "Build a QRP Foo Into Your Fountain Pen" articles does get a bit boring after a while. There are other things to build, and I think that QST (and others) would do go to expand their horizons a bit and cover things besides QRP.

The positive feedback on the QRP articles indicate (despite what the manufacturers and magazine publishers say) that hams today are not afraid of burning their fingers on an iron. So give 'em construction articles! However, keep in mind that not everyone can *use* a QRP rig. In Canada our no-code people cannot operate the HF bands (despite the activities of a certain net.personality who hasn't read that part of the regs :-), so these QRP HF articles are useless to them. What *would* be useful would be a series of articles for the "new ham" (or "old ham" who hasn't built anything before) covering the various kits that are available (such as the Ramsey FM rigs, TAPR TNC-2, etc). Many hams are very interested in building one of these, but are a bit scared to dive in without any help. In many cases that can't find anyone locally to help them out. A two part article on constructing a Ramsey FTR-146, that explained all the gotcha's (Ramsey would be a *great* example of this based on what I've read here over the last month) would go over very well I think.

It would also be nice to see some coverage of what's "state of the art" in ham radio these days. I was blown away to see the Clover article in CQ last month. That was the first article I've read in a ham rag in years that I actually found interesting! Unfortunately it seemed to end about half way through.

So Mr. QST, what sayest thou? If you (and CQ and 73) want me to start up my subscriptions again (I gave up a couple of years ago) you're going to have to diversify a bit. Are you up to it?

[And, to stall the flames, yes I have considered writing some articles, and no none of the major rags have responsed to my many queries for style sheets, writers guidelines, etc.]

True enough considering the level of integration in a modern HF rig, but to me, a bazillion VFO's/memories and all the other features that sprout from a modern HF rig don't necessarily imply state of the art. RF performance is the bottom line, not if the bloody thing keeps your coffee warm and your beer cold on Field Day :-)

>Imagine a QST construction article for a transceiver using

Depends on whether you have a wave soldering machine in the basement :-)

>Now imagine a QST
>construction article on an SSB transciever with one VFO, no memories, no
>scanning, no computer interface, no digital readout; just a basic transceiver;
>you could build one, but it wouldn't be worth the trouble -- the design is
>obsolete.
>
By who's definition??? Up until relatively recently, most tranceivers had only 1 VFO, and if you take a strict definition of VFO, most *still* do (really tunable memories). No memories... so what's wrong with a pad and paper (except for being low-tech)? Depending on the VFO design, computer interfacing could be real easy, and would give you the scanning, memories, digital readout, etc. without the need for duplication of circuitry and expense (provided you had the computer to begin with and were able to write some fairly simple-minded software, or could get someone to). As an aside, personal computing has become quite a bit like amateur radio -- lots of appliance operators who don't know how the bloody thing works (IMHO).

As for DSP and exotic system software, I haven't seen anything impressive in commercial tranceivers. There's a lot going on within the amateur ranks that is just now surfacing commercially.

In fact, the future "state of the art" tranceiver *could* be 3 IC's and an RF amp (ADC, DAC, DSP w/mondo memory). Come to think of it, you probably

could get it to one chip eventually, considering what they can pack on a chip now and the progress rate so far... Then the quality of the rig would depend more on *software* than hardware! :-)

Sorry for the excursion afield, but I must be one of the few who are imune to all the bells and whistles on radio gear these days. I, for one, would love to see a relatively simple HF SSB tranceiver construction article. If I had the time to play with developing a solid, easily reproduced design, I'd have the article on the way to the mags post-haste!

Fluorescents do contain mercury, but again it is a very small amount.

The real problem with mercury in fluorescents, and other disposable
items, is in the waste stream. Sloppy disposal can concentrate
mercury in landfills, spew it out of incinerator smokestacks, or
contaminate garbage workers with it. The mercury in alkaline
batteries is probably more significant environmentally, which is why
the major battery manufacturers are all touting reduced-mercury
formulations these days.

DEFINITIONS:

Date (day only)
Possible Magnitude of Solar Flaring (LOW=C-class, MOD=M-class, HIGH=M or X)
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF SIGnal Quality (see below)
VHF Sudden Ionospheric ENHancement Probs (in %) for LOw, MIddle, HIgh Lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
VHF Sig. Quality rated as: AN=Above Normal, N=Normal, BN=Below Normal,
D=Disturbed (ex. associated with polar blackouts).
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

```

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

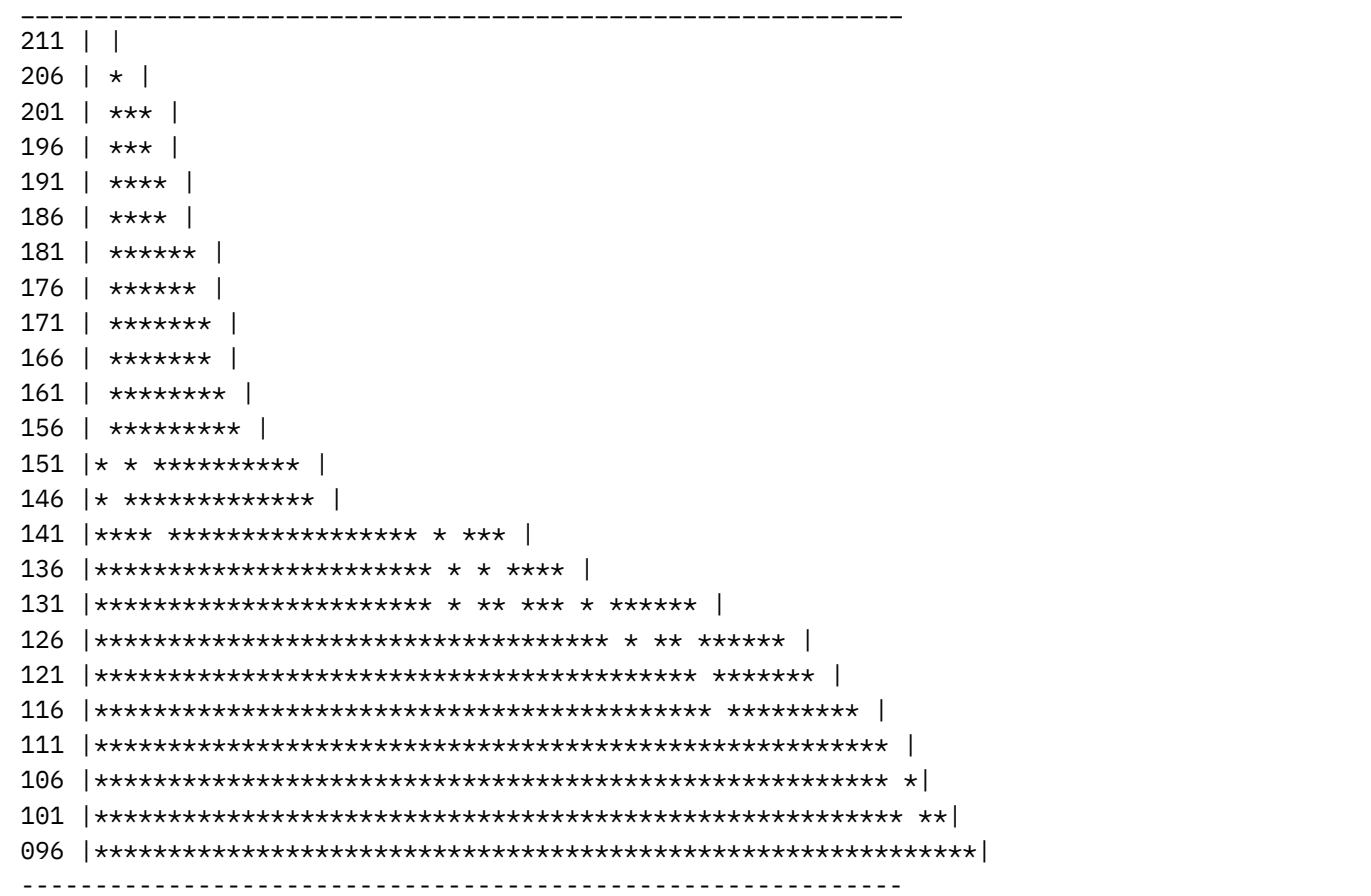
NOTES:
This graph is determined by plotting the greater of either the planetary A-index or the Boulder A-index. Graph lines are labelled according to the severity of the activity which occurred on each day. The left-hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm, J = Major Storm, and S = Severe Storm.

CUMULATIVE GRAPHICAL CHART OF THE 10.7 CM SOLAR RADIO FLUX



GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

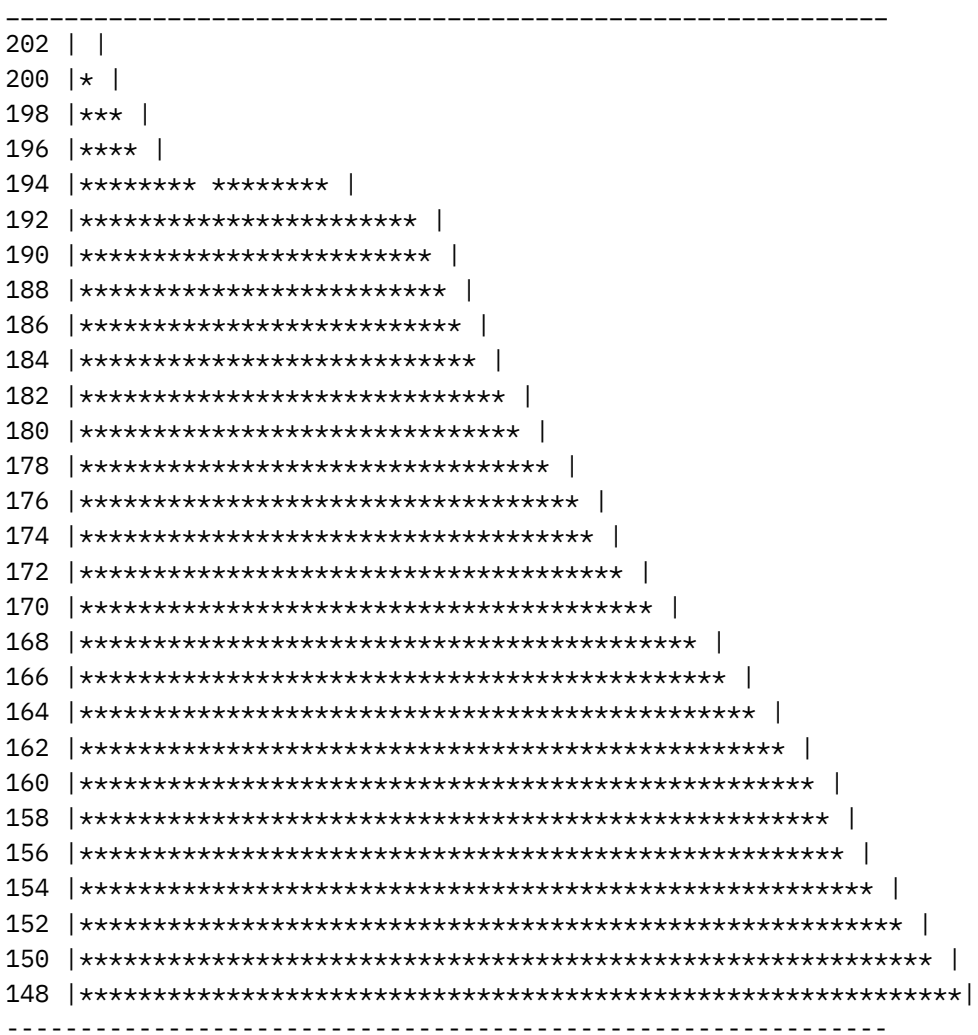


Chart Start: Day #096

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

** End of Report **

3001. R U sick of qrp in qst?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-04 21:34:33 UTC
From: Claton.Cadmus@f100.n282.z1.tdkt.kksys.com
Message-ID: <707690898.F00001@tdkt.kksys.com>
Source record: 289116

If you will, I believe both sides of this issue are correct. I
DO enjoy the QRP articles in QST and wish them to continue. However,
I would like to see more phone capability incorporated in them.

I also would very much like to see a good multiband transceiver with a
digital readout for the homebrewer. Don't misunderstand, i DONT mean an
ICOM 781 clone you can build for $100.00, (not a bad thought though).
But with the new ICs available, a good receiver section, PPL oscillator
with digital display and a transmitter section with 50 to 150 watts
using power Mosfets should be an economical and reasonable request.
Give the ham community a starting base like that and just watch the mods
and updates fly.

Here's another construction article that would be different. How about a
2 meter rig designed to be used only with a TNC for packet. Simple
xtal controlled and inexpensive to build.

Anybody else got any good ideas? QST are you listening?

3002. Giant RF Light Sheets, Tesla and Me (Re: New Light Bulbs).

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-04 21:40:23 UTC
From: awpaeth@watpix.waterloo.edu
Message-ID: <BpCC7F.ILJ@watcgl.waterloo.edu>
Source record: 289117
Cross-posted to: rec.radio.amateur.misc,sci.electronics

Years ago a roommate and I decided that we wanted to build a very useful "light sheet" (we were rooming together right out of Caltech). The idea was to open the edge of a Thermopane window and dust the insides with phosphor. Next, the tesla coil goes in the attic above the living room. The panel would dock on the ceiling beneath, but could be taken down for use as a light table, drafting table, etc.

The previous inspiration had been Joe's est. 7 million volt Tesla coil. He'd been looking for a standard 10KV 1ma type neon sign transformer when he came across some gov. surplus -- 10Kv at nearly one amp! (We later decided this probably drove an entire bank of radar displays). Standard copper sheet primary, the secondary was "slop" wound on a Lucite bar, where the turns had to be made particularly loose (over 1" turn-to-turn on a lucite bar) to prevent arcing. It managed to pull some 1-2 foot sparks and was incredibly loud in operation but I never heard it -- a responsible teacher ordered its destruction soon after its trial run. But it would easily light phosphors at great distances.

We chose not to build the light sheet largly because we both planned to have children some day. Now I've got my three but know better. Still, I think large flat flourescent phosphor panels, with either RF or filament excitation, would be VERY useful in both residential and industrial lighting.

>
>I don't know what's in fluorescents; the RFI bulbs (:-) contain mercury
>vapor. The pressure in the lamps is presumably extremely low; I bet in full
>production they go through an ounce of mercury a year at the factory.

Fluorescent bulbs, and these new RFI bulbs use mercury vapor as the gas that they make a plasma in. Typical fluorescent bulbs, such as any office might have, have a drop of mercury about 1/16 inch in diameter. This may not seem significant to you, but multiply that by 10's of millions, and recognize that ALL go to the garbage dump unprocessed with the mercury unreclaimed, and you should start to worry a bit.

>Mercury, in sufficient doses, is incredibly toxic, but these bulbs probably
>won't be able to deliver a dangerous dose even if you ate one.

Mercury metal is not particularly poisonous when eaten. For centuries, it was used as a laxative. Mercury is most poisonous when adsorbed through the skin and when inhaled as a vapor. The last time you broke a fluorescent bulb (or a fever thermometer) on your floor, you doomed the room you were in to a permenant cloud of mercury vapor. The drop of mercury that landed on the floor split into an uncountable number of small droplets, each of which is evaporating into the air.

One wonders how the "Environmentalists" missed the connection between so called "Green" (eg. environmentally correct) fluorescent bulbs, and mercury?

flloyd@sunburn.West.Sun.COM (Fred Lloyd [Phoenix SE]) writes:

>Maybe illegal according to a strict interpretation, but the capability
>didn't exist when the rules were written (I'm talking about dual-band
>rigs with microprocessor control). I'd have to say that it must be OK

The capability DID exist, but it was not cheap and portable as it is now.

>because: 1) the FCC hasn't said NO, 2), They continue to approve radios
>which do it (the TM-732), and 3) it's quickly becoming a common

They don't approve radios on the basis of what they can or cannot do
within the amateur service, but rather, whether or not they cause
interference from general operation aside from the intended transmit
frequency. The fact that it is approved (besides HF linears) means
it is not expected to violate part 15.

>practice. It's a clear case of the rules not being up to date with
>the times. I don't use the capability often, but when I do I use
>the following "common sense" rules:

>1. Make sure that the local (car to HT for example) link frequency is
>a simplex one
>2. Suffix my spoken ID with "Remote Base"
>3. Make sure the time-out-timer (TOT) is enabled
>4. Use PL on the local link
>5. Be careful to stay in band!

I'm not sure which station (car vs HT) is which. However whichever one
is controlling the other needs to:

1. Be on an auxiliary frequency (no Novices, see 97.201(a))
2. Be identified as an auxiliary station (no longer required but a good idea)

This of course rules out 2 meters for the auxiliary (control op to remote
base) frequency.

>to a repeater *OR* isn't a voice (FM) freq, i.e. AMTOR, NAVTEX,
>etc.

If the setup is only legal as an auxiliary station remotely controlling
a station on another band (regardless of whether you CALL it a repeater)
then of course it has to follow those rules.

If it really *IS* a repeater you are OK. Of course a repeater only
operates on the frequencies allowed for repeaters, has a povision for
ID, and obeys the repeater rules.

>Personally, I think that I am well within the statutes of the law.

If you are remotely controlling a station from an auxiliary station
(the one you are actually at) then are you following 97.201(b)?

97.201(b) An auxiliary station may transmit only on the 1.25 m and
shorter wavelength bands, except the 220.0-220.5 MHz [moot
now], 431-433 MHz and 435-438 MHz segments.

> its not legal.

OK, so say "KB0CY auxiliary and KB0CY under remote control".

I do not believe that the fact that the ID is in fact being sent in through another radio frequency cannot make it legal, nor can I find anything in the rules to suggest it.

Since "auxiliary" is no longer required on the ID itself for the auxiliary station, all I'd be doing is just "KA9WGN for ID".

>of the cross-band repeater (not just supress the audio output)?

I know my IC-32AT works correctly with PL. I have the UT-40 feature installed
for PL squelch and if it is enabled on a frequency (I can select if it is on
for UHF and VHF separately) then that frequency cannot activate repeat unless
the proper tone is present.

I use that feature to repeat my UHF HT into the local 146.76 machine on its
146.16 input. But since the repeater mode scans back and forth, if someone
were in range of me, their transmission on 146.16 could cause it to repeat
in the reverse. By putting an arbitrary tone squelch on the 2m frequency,
I defeat this.

However the SCANNING does stop on signal present and can block using the
repeater... it just won't key up the transmitter.

rlong@magnus.acs.ohio-state.edu (Ronald K Long) writes:

> Our local newspaper states that the oscillator is at 13.56 MHz.

Where will the harmonics be? If there is no frequency wobble, then
we would see some nearby at 54.24 MHz and 149.16 MHz. However inband
harmonics might be problems at 420.36, 433.92, and 447.48 MHz (31st,
32nd, and 33rd).

Also: 1247.52, 1261.08, 1274.64 and 1288.20 (92-95).

While these might be high harmonics, I am wondering how they are generating
the RF. If it oscillates at 13.56 this might be the only problem. However
it might be at a LOWER frequency and just be filtered to 13.56.

>IMHO it remains to be seen whether the quality of light will be
>acceptable to the homeowner.

This is an issue. I can't stand those compact flourescent lights.

SOLAR TERRESTRIAL BULLETIN

05 June, 1992

Monthly Reports for May 1992

/\

MONTHLY REPORTS OF SOLAR GEOPHYSICAL ACTIVITY FOR MAY ARE NOW AVAILABLE:

The monthly reports of solar and geophysical activity for the month of
May 1992 are now available for anonymous FTP from the following sites:

solar.stanford.edu <--> 36.10.0.4 <--> "pub/1992" and subdirectories
nic.funet.fi <--> 128.214.6.100 <--> "pub/dx/solarreports" and subdirs
xi.uleth.ca <--> 142.66.3.29 <--> "pub/solar/1992"

The files to get are:

"mayflr.doc" - Summary of Solar Energetic Events for May 1992.

"maymag.doc" - Summary of Global Geomagnetic Activity for May.

"maytec.zip" - Summary of Global Total Electron Content (TEC),
compressed using ZIP.

"maytec.zoo" - Summary of Global TEC, compressed using ZOO.

"maytec.tar.Z" - Summary of Global TEC, TAR'd and COMPRESSed.

"sgdb-may.zip" - Archive of all Daily Solar Geophysical Data
Broadcasts (SGDBs) for May using ZIP.

"sgdb-may.zoo" - Archive of all SGDBs, compressed using ZOO.

"sgdb-may.tar.Z" - Archive of all SGDBs, TAR'd and COMPRESSed.

** End of Bulletin **

To all radio amateurs

SB DX ARL ARLD030
ARLD030 DX news

Thanks to Bob, WB2CJL, and the Westepn New York DX Association for the following DX information.

TONGA, A35. JA3JA and JA3JM along with AA5K have been active on various bands and modes including RTTY, signing A35JA and A35JM. They will be active from KH6 on June 5 and 6 on 160 through 6 meters, including the WARC bands.

SOUTH GEORGIA, VP8. Keith, VP8CKB, has announced on RTTY that he is willing to set up RTTY schedules. He has left messages on APLINK station CE3GDN on 21074 kHz. He has also checked into the GW3CDP, 21335 DX Net on weekends. Anyone still needing South Georgia, here's your opportunity. He will be on the island until April, 1994.

MALYJ VYSOTSKIJ ISLAND, 4J1. M-V Island has been very active, on 15. 20, 40 and 80 meter CW and SSB. They have also been on RTTY. The DXpedition is scheduled to last until June 9. All QSLs go via OH2BU.

WAKE ISLAND, KH9. Jim Smith, VK9NS, is planning on this one for some time in June. He is also considering Mellish Reef, Willis and Canton Islands, and possibly Heard Island later on in the year.

CORSICA, TK. Bob, G3PJT, will be actIve from June 7 through 24, signing /TK. He will feature WARC band operation around his sunrise and sunset times. QSL to his home call.

ALAND ISLAND, OH0. Eric, OH2BBF, will be on Aland Inland as OH0BBF from June 5 through 7 and again from June 16 through 21.

RWANDA, 9X. Michel, F1MXQ, is QRV for two months as 9X5HM, mostly on CW.

CRETE, SV9. SV9/W0CG will be operational until June 12. QSL via KQ8M.

VANUATU, YJ. Bing, VK2BCH, is on the DXpedition jaunt again. He will be active as YJ0AXV until June 11 and then on to West Kiribati as T30AA. QSL both to his home call.

SOMALIA, T5. Kent, WB8HWO, is now signing T53UN. He is often found on 14256 kHz, with a ood gsignal. QSL to Kent Phillips, Box 1642, Nicosia, Cyprus.
NNNN

Good Luck on DX de KB8NW/OBS

Apparently, someone at General Electric about 70 years ago was fond of Indo-Iranian culture. Ahura Mazda was, if I remember right, the Zoroastrian god of light. The Moguls were emperors of India.

SB SAT @ AMSAT $ANS-151.01
DOVE TESTING CONTINUES

HR AMSAT NEWS SERVICE BULLETIN 151.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 30, 1992 BID:$ANS-151.01
TO ALL RADIO AMATEURS BT

DOVE Speech Developement And Testing Continues

The DOVE Recovery Team continues to monitor the DO-17 downlink frequency of 145.825 MHz and to examine the on-board computer (OBC) memory dumps. DOVE listeners have noted that the voice messaged has changed significantly since speech testing was commenced last weekend. At the present time the message has becomed "garbled" and unintelligible. The DOVE Recovery Team members are not sure of the exact cause of the message change but they have several theories that they are looking into. The most probable is that there is a software "bug" which is over writing the memory locations where the speech software resides. At the present time they do not feel that this is a set back and are so far pleased with the progress that they have made so far. Watch for further updates concerning DOVE in the AMSAT News Service (ANS) bulletins.

3020. 3rd District Callsigns

Newsgroup: rec.radio.amateur.misc

I have been reading on this net about the difficulty in building
your owm equipment and how hard it is to get parts.....Bulll...It has never
been easier too get parts....calll Digikey.....Mouser......Ocean States
Electronics....etc .... whip out the plastic and away you go....a few
days later UPS (sic) or Fed X can drop off enough parts to build
an IC765.....

You can build a receiver with excellent performance may not look
a pretty as a rice box ..... but can out perform it ....

Stick to modular construction...build a VFO now and replace it with
a DDS later (as the prices drop).

ne last supplier.... PENSTOCK 1-800-penstock.... all kinds
of rf related components including Miniciruits...HP semis...
etc.

I don't work for any of these guys, I just buy their goodies...

Any questions... let me know...

Clark Fishman WA2UNN cfishman@pica.army.mil

>track the crystal closely, choice 2 seems to imply the opposite.
>Am I thinking along the right lines ?

Depending on what you do with the LPF you can get phase modulation
or frequency modulation.

If the LPF passes all the audio frequencies, then when you modify
the VCO input with the audio, the frequency change results in a
change in the phase comparator output in the opposite direction
(in a stable system) so it will compensate for the change, giving
you just a modulation of phase.

If the LPF passes none of the audio frequencies, then you have a
rather freely modulated VCO (possibly way too wide) which cannot
track the crystal at all because the tracking is too slow to keep
up with the audio changing it. You have FM, but you might not
have narrow FM or a stable frequency.

>I wish I'd paid more attention at college now :-) :-)

I assume you also sold your text books?

Get:

ARRL Radio Handbook
The Art of Electronics

for your library. Both are excellent, and better than anything you would
have gotten in EE classes (unless you like deep mathematical theory).

Depending on your effective bandwidth, you can extend it. I've read
about very slow digital going something like 1000 to 2000 km.

> place *above* 450 MHz. For that matter, I'd like to see current NTSC ATV move
> above 450, too...
> --
> Jay Maynard, EMT-P, K5ZC, PP-ASEL | Never ascribe to malice that which can

I am involved in 50-1296mhz ssb, fm, and digital. I am also an ATV'er. I
do believe that new experimentation like HDTV should move up the bands but
since the ATV'ers have had allocations in the 440 band long, long before
computerized digital, why should it even be suggested that they move. Why
not digital, or FM? We already have one repeater for every ham on 2m. Do
we also need one for every ham on 44O? Lets break some new ground here.
For all the people fighting to get allocations for their own private repete
repeaters on 440, why don't they move up to 23cm.

ATV'ers already in many parts of the country have freely given up all but
two channels of their orginal allocations for other services, primarily
for digital. The remaining two channels are for reapeater in and out.
I think this is more than fair and gracious. ATV'ers have no more money
than the rest of the ham population and I think it is unrealistic to
suggest that they trash their equipment and move. Equipment that really
can't be used for anything else, unlike FM rigs that can be put into
several different uses on 440. Besides I can simply modify a TV out
of the box for ATV reception on 440. I can't on 23cm. Some parts of
the country use it for Skywarn operations which is a real value consistent
with our charge. There are some ATV clubs rebroadcasting Space Shuttle
video when it is up, that is viewed by Hams, non-Hams, and kids in schools.
Anybody with a cable converter box can hook it up to an outside antenna
and receive ATV. Try it, you might like it.

> On a visit to Thomas Edison's winter home and laboratory in Fort
> Myers, FL, one of the guides told us that Edison designed that base.
> At the time, he was interested in Asian culture, and the term "mazda"
> meant something that appealed to him. Unfortunately, I don't remember
> the meaning.

This one aroused my curiosity so I decided to look up "mazda" in my dictionary. The closest I
got to it was "Mazdaism (or Mazdeism): another word for Zoroastrianism." Is this the piece of
Asian culture Edison was interested in I wonder?
Somewhere at home I have some valves dating from the late 60s/early 70s. At least one came in a cardboard box with MAZDA written on it. I assumed it was a brand name, though there is nothing to indicate a connection with Mazda cars. It wouldn't surpise me if they were one and
the same given the diversity of operations of a lot of Japanese firms. After all Mitsubishi make cars, TVs, VCRs and aircraft components.
Any Mazda employees care to comment?

3027. FAX 4.1 basic commands in english

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 10:39:15 UTC
From: erwinn@ecs.comm.mot.com
Message-ID: <1992Jun5.103915.27641@lmpsbbs.mot.com>
Source record: 289048

A participant of this news area (Rejean Roy, royre00@tohi.dmi.usherb.ca,
VE2IMS) was so kind to forward FAX40.ZIP as "uuencode" via email to me,
and i promissed him to translate at least the basic commands of this
program from German to English. Perhaps some other readers of this news
area are interested in this translation.

Erwin Nikl,
Motorola,
at Taunustein near Wiesbaden, West-Germany
erwinn@tau_mail.comm.mot.com

English Translation of Basic FAX 4.1 Commands
==========
by Erwin Nikl, DG6ZS
1-Jun-1992

This translation refers to the pages and sections of the original German
manual ("FAX.DOC" 91/03/09 11:27) as it was written by Eberhard Backeshoff.
I am sure that there are some mistakes in the translation, due to the fact
that English is not my mother tongue.
I thank Jurgen Bartels who walked through this text to avoid major errors.

General:

The German "Umlaute" ", , , " are replaced bei "ae, oe, ue, ss" to avoid
problems with some PC code pages.

abspeichern = save
Abstimmanzeige = tuning display
Aufloesung = resolution
aus = off
Bild = picture
Bilder = pictures
Bildschirmtest = screen check
Datei = file
Datum = date
Dauer = duration
Drucker = printer
ein = on
Empfang = reception
grau = grey
Hub = frequency deviation
(J)a = (Y)es

laden = load
links = left
(N)ein = (N)o
Punkt = pixel, dot
rechts = right
Schraeglaufkorrektur = slope correction (synchronize timing)
schwarz = black
speichern = save
Termin = schedule, date
verschieben = move
vorhanden = present
wartet = waiting
weiss = white
Wetter = weather
Zeit = time

Page 5: Hardware Requirements:

Normally a hardware converter is required, which uses one of the COM ports as
a parallel interface. A connection to the game port is also possible, but
COM 3 and COM 4 are not supported. The parallel bits use RI, DCD, DTR, RTS
and GND.
The "Simpelst"-converter on page 29 does not work very well, it has also to
be considered, that DTR and RTS must have the correct polarity to avoid
damaging the OP-amp. Also, timing problems with undesired interrupts, caused
by EMS cache or accessing the disk can occur. Answer the question for a
"Hardware-Konverter" with no, if you want to use the simple version.
Copies of the schematics for various hardware converters are available, if
the shipping and copying cost are prepaid.

Configuration:

If the program is started the first time and the "FAX.CNF" file has been erased,
or the "(K)onfiguration aendern" key is pressed at the main menu, the
program configuration can be changed.

Page 7: Screen Configuration:

If a "HIRES" graphic mode is selected, it has to be considered, that the
number of pixels divided by 8 must not be greater than 65536, e.g.
800 * 600 / 8 = 60000 < 65536 (ok)
1024 * 768 / 8 = 98304 > 65536 (not ok)

To check the graphic mode selection press "(B)ildschirmtest" in the main menu.
Grey bars will then be displayed.

Page 8: Printer Configuration:

Select one of the predefined printer drivers by using the cursor keys.
An own printer driver can be defined at "0", "Eigenen Drucker definieren".

To check the grey steps of the printer press Dr(u)ckertest in the main menu.

Page 9: Converter Configuration:

Answer the question for a "Hardware-Konverter" with (N)ein, if you want to use the simple version.

The maximum pixel frequency (Maximale Punktfrequenz) depends on the used computer (>= 4000, for fast ATs >= 8 MHz).

Page 10: Synchronize PC Clock:

"Schraeglaufkorrektur" informs how an undesired slope can be corrected during fax reception.

Page 11: Operation:

The higher audio frequency corresponds to "white", if this is not taken in consideration then the phase synchronization at the beginning of the reception will not work.

Page 12: Main Menu:

"(D)ateiname" ... is the file name without extension where pictures are saved during the reception (if enabled). The extension of the file name is a consecutive number to handle more than one picture.

"(K)onfiguartion aendern " means change configuration.

"(B)ildschirmtest" test the screen mode with a grey step.

"Dr(u)ckertest" test the printer with a grey step.

Page 14: FAX Reception:

When FAX reception is started by pressing the "F" key in the main menu, a status window appears.
The meaning of the parameters:

Page 14: "M": receive mode selection:

There are 10 predefined modes selectable, their data can be changed by the mode editor. If a new mode is selected, other parameters like the grey display mode are also set.

Page 15: Printing and saving:

If either "(D)ruck" or "A(b)speichern" (print or save) is selected, the picture is printed, respectively saved during the the FAX reception. Subsequent saving of a picture which is already on the screen is not possible !
It is not possible to select print and save at the same time.

Page 16: Phase synchronization

If "(P)hasen" is set to "ein" (on) the program waits for a synchronization signal which ensures the left side of the picture is at the left side of the

screen. The phasing signal of the FAX stations normally consists of 5% white and 95 % black.
If the phase signal is decoded correctly the "lck" for "lock" is displayed.

"N" means normal phase synchronization, "I" means inverse phase synchronization (95% white, 5% black). Inverse phase synchronization signals are used e.g. by METEOSAT.

Page 16: APT:

Automatic Picture Transmission waits for a start tone of the FAX station. Depending on the start tone it can also distinguish between module 576 and module 288 of weather FAX stations.
The three APT states are "Termin", "wartet", and "aktiv" (scheduled, waiting, active). If a start tone is decoded, APT goes to "aktiv", then after a stop tone has been received, APT goes back to "wartet".
If "WEFAX288" or "WEFAX576" is selected the respective module is recognized by the APT.
By pressing the key "A" APT can be activated and deactivated manually, but the program will wait for the phase synchronization, unless it is disabled manually.
APT can be disabled entirely by pressing "X".

Page 17: Moving:

If you start during a running FAX transmission (phasing and APT must be off) the position of the picture can be changed by pressing "(V)erschieben" and by using the cursor keys to move the appearing cursor to the edge of the picture; then press "ENTER".
This is also possible at S(h)owpic.

Page 18: Grey steps:

If "(G)rau" is set to "ein" the picture is displayed and stored with grey steps, otherwise ("aus") only black and white are used. Grey pictures need much more memory space than black and white pictures.

Page 18: Orientation:

-> means representation of the picture from left to right
<- means representation of the picture from right to left
v) means representation of the picture from top to bottom
^) means representation of the picture from bottom to top

With "(O)ri" horizontal and vertical picture display can be selected.
At vertical display it can take e few seconds at module 576 after APT start until something is displayed.

Page 19: Frequency deviation:

If you use the "simpelst" converted the difference between the black and white frequency has to be defined. "(H)ub" is one half of the difference

between black and white frequency.

Page 19: Other commands:

The following key commands do not appear within the status window:

"X": APT enable/disable
"R": inverse display on/off; APT must be "wartet" or "------"
"F": APT frequency counter on/off, to measure an unknown APT frequency.
"C": display of the brightness value; similar to "F"
"K": automatic tuning enabled/disabled
"E": call the mode editor, to change one of the existing modes, or to create
a new mode. A mode can be disabled by setting module to 0;
"alt"ernate mode for APT reception;
"aufl" set a fixed value of dots per line, 0 means automatic;
"Q"uit
"S": to correct an undesired slope using the cursor keys,
cntl cursor for parallel picture movement

The default configuration data can be recreated by deleting "FAX.CNF".

Page 22: Scheduled reception:

Together with the Automatic Picture Transmission (APT) it is possible to
receive FAXes at a certain date and time.
Use "(E)[ditieren] der Terminliste" in the main menu to enter up to 32 dates.
For a every day reception enter "00.00.00" for the date.
If valid dates are in the date list the main menu shows the message:
"Termine: ..... vorhanden".
With "Dauer=nn" (duration in minutes) the FAX reception can be stopped
after nn minutes if no stop tone is decoded. If "Dauer" is not specified,
60 minutes are assumed.
If 10 minutes after the date and time entry no APT start tone is decoded,
the program switches to the next date.

The commandline parameters "/TB" (save during reception) and "/TD" (print
during reception) can be used too start "FAX.EXE" from "AUTOEXEC.BAT".
The computer can then be switched on by any hardware time switch circuit.

Page 23: S(h)owpic:

After pressing "h" a file can be selected using the cursor keys, e.g. select
"TINA1". The picture will be displayed so that its whole image fits on
the screen while preserving the original aspect ratio.
With "(P)aram" the parameter menu is called, the picture can be modified as
described on page 18 and 19.
To zoom a part of the picture use "(Z)oom". A frame appears on the screen.
It can be positioned using the cursor keys, and its size can be varied using
the "+", "-", "x", and "y" keys.
The zoomed part like the entire picture can be saved ("(S)peichern") and
printed ("(D)rucken"). Depending on the the grey step selection ("(G)rau")
the picture is saved as black and white or with grey steps.

Page 26: Saving pictures:

If pictures are saved to disk they will be compressed. All received lines
are saved independent from the used video interface.

Page 34: License:

The program is declared as "shareware"; the author (DK8JV,Eberhard Backeshoff)
expects a gift of DM (Deutsch Mark) 30.00 if the program is useful for your
applications.

3028. Ground Rod Placement In Basements

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 10:43:12 UTC
From: SEELER@upei.CA
Message-ID: <45D3D4371FBF201741@UPEI.CA>
Source record: 289045

I currently have a "RF" ground about 2.5 - 3 meters from my station.
I do not appear to have any major problems except on 6M (using a
TS690S). I have a B&W Low Pass filter for 6M operation in-line etc.
However, I do get some radiation of the second harmonic which appears
to be coming from the ground rod (6 feet long). The interference
(tuned into using a sony type walkman) does not extend more than
25 - 30 feet from the ground rod and there are no houses (other than my
sterio when tuned to 100 Mhz FM - fortunately no stations are there
currently) apparently affected. Note that the ground rod is connected to a
copper ground bus (pipe) at the station by RF strapping meant for the purpose.

I have been thinking of putting another ground rod in closer to the station.
The only way to do this (I'm in a finished basement and the station is less
than 1.5 meters from the hole through the basement wall) is to DRILL a hole
through the basement floor (cold room next to station) drive a 6 foot
ground rod down into the earth beneath the floor and seal the gap (if any)
between the rod and floor using cement and silicon

seal. Has anyone tried this
or would they recommend it? My RF gound rod would then be about 0.5 meters
or less from the rig. I do have a sump hole and pump in a work room and
water has not been a problem to date (Knock on wood). Comments or suggestions
would be welcome. I've thought about using a counterpoise for 6M but if
I'm on other bands and it is the ground rod , this might make it worse
for the other bands. Comments?

I also would point out that my coax RG213 and the ground strap go out the
same hole. I recognize that there might be crosstalk. But - would ferrite
beads solve the problem of a long RF path for 6 meters? I don't seem to
get harmonic radiation from the antenna to any great extent.

All comments and suggestions would be welcome. I don't seem to cause problems
for neighbours - but for my peace of mind I'd like to solve it.

3029. MORE OSCAR HELP

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 12:15:16 UTC
From: sschend@magnus.acs.ohio-state.edu
Message-ID: <1992Jun5.121516.9536@magnus.acs.ohio-state.edu>
Source record: 289046

We're back at trying to get an OSCAR station on the air.
Because of a unavoidable long feedline (85 ft.), we are considering locating the amp with preamp on the tower. The amp we are considering is the RF concepts 10-100 for UHF, and 10-170 for VHF. Anyone have any experience doing this? Does the preamp in these amps have enough gain for OSCAR?
Thanks,
-Steve WB5RWS/8

3030. Tape backup subsystem/device driver

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 12:41:08 UTC

Source record: 289047

Thanks to Edward, N3IAS, I've revised the list and I'll add
some uses as I come across them.

Here are the ISM frequencies. The source is an OMEGA
Engineering wall chart that we have hanging in the lab.
ISM stands for Industrial, Scientific and Medical.

6.78 MHz +/- 15 kHz
13.56 MHz +/- 7 kHz
27.12 MHz +/- 0.163 MHz
40.68 MHz +/- 0.02 MHz
915.0 MHz +/- 15.0 MHz
2450.0 MHz +/- 50 MHz Microwave ovens
5800.0 MHz +/- 75.0 MHz
24.125 GHz +/- 125 MHz
61.25 GHz +/- 250 MHz
122.5 GHz +/- 500 MHz
245.0 GHz +/- 1 GHz

Certainly "mazda" isn't a Japanese word. "Masuda" or "Mazuda" is how a
Japanese might transliterate "mazda". But that isn't the name of the
company; its name is Toyo Kogyo.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Well, this depends. For a regular lamp in which the lamp shade is
supported by a standard lamp harp, the base will screw in the socket
but the harp won't fit because of the bulge in the bulb base just above
the threads where the RF unit is located.

> write software that does the hard stuff?
> --scott

OK, I'll write it. Seriously, I've got a commercial product that I developed that does this (PC Super Keyer). I'm getting tired of the advertising costs, overhead, much work for little money, etc.

It is written in C and has most of the fancy keyer goodies - 8 unlimited length memories, auto-increment serial number, fast/slow speeds to send parts of a message faster/slower, message-in-a-message, 4-600 wpm, random code groups and US calls, on-screen display of paddle input, etc.

It uses a reed relay connected to the parallel port for keying. Keys most any rig - tube jocks might want to use an little RC combo to save contacts from sparks. Paddle input is also to the parallel port. Uses LPT1-3.

I'll start on it in a week or two and send it in to QST. Hey, if they don't want it I can always send it to 73 - they will apparently print ANYTHING!

3036. UNIDEN MR8100 SCANNER QUESTIONS-800 Mhz & Hysteresis

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 14:01:23 UTC
From: ket@cbnewsm.cb.att.com
Message-ID: <1992Jun5.140123.19844@cbnewsm.cb.att.com>
Source record: 289052
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,alt.radio.scanner

Has anyone found a solution to the lack of direct keyboard input of cellular frequencies to the Uniden MR8100? I would like to be able to have that capability other than via the computer software program.

My second query is whether anyone has found a solution to the severe hysteresis problem with this same scanner. It employs the turbo-scan function and presents a "new" challenge to trying to solve the "loose" effect on the squelch control. (The old solutions do not appear to apply to this newer turbo-scan circuitry)

Thanks for any input you may be able to offer - Keller Taylor - WA3YSU

> communicator. ....

I remember hearing of a device called UQC (alright, it was in Orson Scott Card's novelisation of
The Abyss so I don't know whether such a device exists) which shifts normal sound frequencies into
ultrasonic ones which travel much further in water. I suspect that the range may be shorter than
what you want and I wouldn't know how to build one but it might make an interesting electronics
project.
As an amusing aside: Years ago when the Man From Atlantis was on TV here - with Patrick Duffy
demonstrating his ability to speak under water - that our national TV service RTE used to show a
brief message after each episode clearly stating that you can't breathe or speak underwater!

Simon Woodworth.

3041. TS-820 power-up problem

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 15:23:54 UTC
From: dube@cpdvax.CSc.ti.COM
Message-ID: <199206051515.AA03766@tilde.csc.ti.com>
Source record: 289055

This is a request for information for all current and previous users of the Kenwood TS-820s transceiver.

The one I have will not power up properly. It requires that the power switch be turned on-off-on in rapid succession. If more than a few seconds elapse between the "off" and the second "on", it still doesn't work.

I've isolated the problem to the fix-vox board. It appears that it gets a false mike key signal (or locks up so that it thinks the key is activated). There seems to be a transistor oscillator or switch in the keying circuit on the fix-vox board, and it looks like this circuit is the culprit.

Has anyone had a similar problem with this circuit? What was the specific failure? the transistor? a capacitor?

Thanks for your help. I will post the "fix" when I find it...

>performance is the bottom line, not if the bloody thing keeps your coffee >warm and your
beer cold on Field Day :-)

Hmmm... the marketplace seems to differ with you. Modern rigs are all
bells and whistles; their RF performance is not noticably better than
older rigs. There are many 30 year old rigs that will give modern ones a
run for their money, and in some ways are better, e.g., PLL phase noise in
modern rigs. It's clear that hams want memories, scanning, et al, more
than they want RF performance... otherwise, the manufacturers would be
making functionally simple rigs with super duper performance. Fact is,
the level of RF performance in ham rigs built over the last few decades is
plenty good for amateur service. This isn't radio astronomy after all,
just a hobby. And there's a lot to be said for cold beer on field day!

> No memories... so what's wrong with a pad and paper
> (except for being low-tech)?

Following that line of reasoning, we'd all still be using spark gap
transmitters and cat whisker receivers.

> In fact, the future "state of the art" tranceiver *could* be 3 IC's and
> an RF amp...

A very, very good point. Maybe we're just in an interim period, until the
state of the art makes homebrewing rigs practical again.

3045. Mazda

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 15:45:52 UTC
From: P.Lucas@unixa.nerc-swindon.ac.UK
Message-ID: <9206051545.AA13085@ucsd.edu>
Source record: 289059

Mazda was a trade-name for electron tubes and lamps made by the British company 'Associated Electrical Industries' (AEI) which was formed in 1927 by the merger of the tubes divisions of the Edison-Swan Electrical Company (Ediswan) and the British Thomson-Houston company (BT-H) and Metropolitan Vickers (Metro-Vick).
Mazda was probably best known for their (failed) attempt to introduce a version of the Octal tube-base. 'Mazda Octal' bases had a center-pin that was thicker than the normal octal base, and two of the pins (heater?) were offset too. Fortunately this typically British aberration died the death it rightfully deserved.

For further info, see '70 years of radio valves and tubes' by John W. Stokes (ISBN 0-911572-27-9) Vestal Press, New York, 1982

Source record: 289065

hi,

I've had a dj580t now for 2 weeks and am still happy with it, except for the relatively poor rubber ducky. I need some advice.

what's the opinion on Maldol duckies? they have a 144/440/900 12.5 inch ducky that lists for $38. anybody out there have one?

other netters have suggested the Larsen antennas, what price range are they for 144/440 ? are they supposed to be better?

what about the MFJ-1712 dual band ducky? anybody have their speaker mike that is alinco compatible? I think it goes for $25.

so, any advice on rubber ducks and speaker mikes, welcome.

tnx in advance,
John callsign pending (another 2-3 weeks I hope not more)

ps. no, I haven't been on the air-except as third party :-(

In your mind you can learn to never miss, and if
you can do it in practice, you can do it in life

Oh, I don't know, have you considered 60Hz ac at a suitably high voltage of,
say, 12KV?

The industry standard way of exciting neon signs of all sorts is to transform
powerline voltage to 12-18Kv and let the high voltage make the plasma.

> the waveform of existing TV. The ACT system does fill some of the

This is not true, at least for the DATV (Digital Advanced Television) systems now being considered by the FCC, and the stated goals of the FCC for this program. DATV (the new abbreviation that they're trying to push to replace "HDTV") will NOT be compatible with NTSC; the only requirements are that it occupy the same 6 MHz-wide channel, and cause minimum interference to existing NTSC broadcasters on adjacent channels (or on the same channel in nearby markets). Since DATV WILL be a highly-compressed, fully digital system, there is simply no way that it's going to be compatible in any way with NTSC, nor received on existing receivers.

> have narrow FM or a stable frequency.

Well, my actual application is data transmission (G3RUH,
K9NG, et al), which would seem to imply a response down to
either DC or 280Hz, depending on who you listen to. If my
LPF passed the baseband signal, then it would result in a
phase modulated carrier ? I think I'm missing something
here. Would I would need to preemphasize the baseband ?
My (simplistic & probably flawed) thought process was :-

1) Assume a steady state.
2) Apply baseband signal - say the instantaneous voltage is x
3) The VCO tracks, the phase comparator outputs a correction
voltage -x.
4) If my LPF passed the correction voltage, I'd be right back
where I started (after some delay).

I was assuming that for this scheme to work, the LPF had to
block any changes which which might actually be the baseband
signal - and since I require response down to DC, how
would the PLL ever track ?!? Is the key to this in the
magic phrase "after some delay" in step 4 above ?

I also got some email replies; most voted for modulating
the VCO control voltage. Some mentioned PM, and I just got
a phone call (thanks Clark) pointing me at the Motorola
CMOS Application Specific Standard IC Manual - I'll have
to try and track down a copy of that.

"Mazda" was, I believe, the brand name for incandenscent lights sold by
General Electric. Whether or not this term for the base predates GE's usage,
I do not know.

On the other hand, I think that "Mazda" (the Japanese car company) is a
corruption of "Matsuda," a Japanese proper name (meaning "pine field").

"Mazda" was a trademark of the Edison Electric Light Company.
Edison distributed a beautiful set of posters in a Maxfield Parrish style
in the early (pre-GE) days of the lamp business.

I think, but am not sure, that the "mogul" base was a competing
standard from Thomas-Houston. It is, in any case, just a bigger version
of the Mazda base.

I hope this is the correct group in which to post this.

I am interested in buying a hand-held FM radio for use at bicycle races. Usually we are given Motorola P-100 or P-10, with the former much more common. I am interested in getting a couple for myself, however.

A local sales rep is trying to sell me on a Maxon PS or SP 2000 and claims it is as good or better than the motorola P-100. It is much cheaper. The motorola is $550. The maxon comes in a VHF for $400 or a UHF for $500. I have not yet decided whether I would prefer VHF to UHF.

The UHF would have repeater capability but some people say the VHF would be superior in the mountains, where bicycle races often go.

I would appreciate any opinions. Thanks.

please e-mail me at:

3055. Need advice from Milwaukee HAMS about where to live

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 17:51:37 UTC
From: cberthel@cc.utah.edu
Message-ID: <1992Jun5.115138.1@cc.utah.edu>
Source record: 289068

I'm moving to Milwaukee area in about six weeks and was wondering if there are any Milwaukee HAMS on the net. I'll be flying there July 18 to look for a place to live and would like some advice on where I should settle if I want an HF antenna. I want to be within 20 minutes drive of UWM and prefer the general area of Brown Deer, Shorewood, Whitefish Bay, Riverdale, and northeastern Milwaukee.

Are there any Milwaukee hams out there who live in an apartment or condo complex with HF antennas? What complexes should I look at that have the potential of putting up a wire dipole? What kind of antennas do you use that survive the winters there?

Please send your comments to me directly. Thanks.

>excellent suggestions deleted.

>Anybody else got any good ideas? QST are you listening?

"QST", the ARRL HQ staff, has a growing number of people who are connected to the internet. Some of us even read the newsgroups on a regular basis. :-). I have been printing the postings about the thread, and will continue to do so, and will make them available to the rest of the staff, if they wish to see them.

I want to point out, though, that this is a second-best approach. The thoughts and desires of our members posted will have an impact on those that read them here, but not nearly as much impact as a personally written letter to ARRL HQ and/or your Division Director. The letter has another advantage -- when it is routed to someone here at HQ, that person will have to think about what you have said at least enough to answer you. :-).

I would like to thank those who have suggested or asked for change, as well as those who voiced support for our QST content. Both are important to us here at HQ. 73, Ed.

>that is alinco compatible? I think it goes for $25.

Welcome to ham radio, John! I have the MFJ mini-speaker/mike for my
DJ560T. The mike side is pretty good, but I have a hard time hearing
the speaker unless I crank the audio up to the point of distortion.

The mike does have a handy clip which can be fastened to the lanyard
hole on the radio case. All in all I suppose it's worth the $25;
without it, your wrist can get mighty tired holding the HT up to your
ear!

"HAM SAIL 1992"
BOSTON EMERGENCY MEDICAL SERVICE
Communications coordinated by the BOSTON AMATEUR RADIO CLUB

2 June 1992

Dear Ham:

I'm sorry this message seems so impersonal, but the magnitude of the task we hams have been asked to undertake matches the gigantic spectacle called "Sail Boston 1992." From 11 to 16 July 1992 the visit of over 260 tall (sailing) ships and over 40 warships to Boston will commemorate the 500th anniversary of Columbus's first voyage to the New World. Recently revised visitor forecasts now range from 2 to 7 million people expected at, on and around the waterfront and harbor islands.

The Boston Emergency Medical Service (EMS) has requested that Amateur Radio operators assist in providing communications for about 20 Medical (not just first aid) Stations. The crowds will be large, the demand for services will be great, the days will be long. Although it has been in the planning for over two years, the magnitude puts all services in "disaster conditions." Using several radio networks we will be calling ambulances and evacuation helicopters, requesting supplies, and forwarding victim data.

While the ham part would appear to be for another big public service event, this is the "reeeely big" one for us. This will be a ham response to a true disaster. But enough of the scary stuff. This "disaster" will be the most fun and excitement you've had in a long time. Even if you have seen some of the tall ships before, this many graceful ships are literally a once in a lifetime experience.

But there's more. Your special credentials will permit you access to special areas when you are not on your ham assignment. You can bypass crowds and tourist lines to go on board the ships. There will also be special rest areas for hams and the other medical staff during the shifts. I'm told that special souvenirs may also be available.

Now the important stuff. Preliminary estimates indicate that on Saturday we need about 150 hams, and Sunday will require 80 hams. The weekdays will need about 50 hams each day. I know it's not easy to do, but hams respond when needed, and here's our chance to shine (including some of the best public relations notice ever available). We have been asked to provide voice, packet and video networks; each for different logistical needs.

Actual assignment durations will not overload yo{u. In fact, we will probably not use all your time slots you show to be available. So please indicate all shift assignments you can possibly serve, and then we will be able to pick a few from them.

After the assignments are made and the credentials are produced, you will receive them and other materials and goodies in the mail. You will be informed where to park your car (in a secure guarded area) for transport directly to your site. Also included will be the h~ram operating procedures, network plans, frequencies, etc. Incidently, plans call for each Medical Station to have AC power (generator or otherwise), but you never know. The equipment you list will be very valuable in helping design the networks. If you can leave your equipment for another ham to use for the full day, the weekend, or for the entire event, please note this on the form.

Please complete the Availability form and return it IMMEDIATELY to the address shown below. If you have any questions, please call me promptly at (508) 650-9440 day or evening. To assist in getting the word to other hams, please make copies of this letter and the form to distribute.

Send forms to: HAM SAIL 1992
BOSTON AMATEUR RADIO CLUB
P O BOX 116
BOSTON MA 02161-0901

Thanks and 73,

Bob Salow, WA1IDA
Coordinator for Ham Sail 92

3059. Re: Quement warning

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 18:41:46 UTC
From: notjim@acidqueen.Corp.Sun.COM
Message-ID: <l2vdbaINNalu@jethro.Corp.Sun.COM>
Source record: 289073

In article <6893@public.BTR.COM> grady@btr.BTR.COM (Grady Ward grady@btr.com) writes:
>My first experience with Quement Electronics amateur department
>this last Saturday (May 30) was an unhappy one.
>
<details of a bad experience deleted>

Undoubtedly, this bad experience with Quement left Grady with bad
feelings and he'll not go back.

My experiences with Quement have been exactly the opposite, however.
I've dealt with the folks in the amateur department and always found
them to be willing to be helpful and pleasant to deal with. I've
dealt with the parts counter folks and had good experiences getting
special parts ordered. I've dealt with the customer service people
and, of course, the cashiers at the registers and consistently have
been treated well.
>
>For an amateur who is was willing to pay Quement's higher-than-HRO's prices,

For those few things for which I've taken the time to compare prices,
I've found HRO and Quement prices to be either the same or within
pennies.

>for any reason -- at least HRO makes an effort to be helpful, even if out of stock.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
And this, just to complete the picture, is counter to my experience
at HRO.

One one purchase I wanted to make, HRO didn't have a demo
model to show me and they wouldn't open a box until *after* I had
paid them for it. I opted not to.

On another purchase, they were out of floor stock of an item, although
their computer indicated they had 5 more in the back room, and I had
to explicitly ask the clerk to get me one out of the back room. The
exchange went like this:

me: I came in to get two Van Gorden 1:1 baluns but I don't find any
out on the rack.

Helpful Clerk: <looking in the direction of the rack>: We're out of
them.

me: Do you have any in the stock room?

Helpful Clerk: <surprised look> : Uh, let me check the computer.
<punching of keys and puzzled look> Yeah, the computer says

we have 5 in stock.

<lonnnnnng pause>

me: Would you go get two out of stock for me?

Helpful Clerk: < disappears into back room and returns with exactly two baluns....aparently content to complete only the current transaction and uninterested in restocking the display rack>.

There probably is no punch line to this other than the observation that any store on a given day can provide a pleasant experience or not. For me, I've always managed to hit Quement on "good" days and HRO on "bad" days.

73,

Jim Lockwood - KM6NK

>specified for that frequency."

So if somebody was to build a multi-megawatt Tesla Coil running at 27.12MHz...

Well, maybe if enough of these RF lights are running, we can do another
Tesla trick: broadcast power without wires :-)

tony o.

3063. Re: QSL Label Print from DXBase

Newsgroup: rec.radio.amateur.misc

>starts at 5/8". This results in the last line of the label
>overwriting the edge of the label.

I'll post as well as EMAIL since there may be others interested.

According to the Deskjet manual, the default top margin is 1/2 inch
(3 lines) from the top of the "logical" page, which results in an
actual top margin of a bit more than 1/2 inch. To change this,
you send an escape sequence: <ESC>&l#E where <ESC> is the escape
character (ASCII 27 decimal), "l" is a lower case "L," and "#" is
replaced by the number of lines in the top margin.

If you send: <ESC>&l2E this should solve your problem.
How to make DXBase do this is left as an exercise for the reader. :=)

3064. IC-2AT help

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 19:30:34 UTC
From: royre00@DMI.USherb.CA
Message-ID: <BpE0uy.4s9@DMI.USherb.CA>
Source record: 288979

Does somebody have user manual and electronics plans for the
radio IC-2AT. I am looking this for one of my friend who he has some
problem and he want to repair it.

Thanks 73

> o A KEYER. None of this Curtis 1-chip stuff: A *real* TTL version.

It was only a few years ago that QST was FILLED with keyer articles.
To the extent that people got sick of them. (And fortified some
people's image of the ARRL as pro-CW.)

That's probably why you don't see these articles any more.

3066. Packet distributions for Pennsylvania and NJ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 19:38:56 UTC
From: pascoe@rocky.gte.com
Message-ID: <1992Jun5.193856.31198@europa.asd.contel.com>
Source record: 288978
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

I want to send a packet bulletin to a distribution covering central
and eastern Pennsylvania, as well as northern and southern New Jersey.
What is the current method for addressing ALL@ type messages?

3067. Re: Problems building QRP rigs?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 20:12:43 UTC
From: ehare@arrl.org
Message-ID: <142@arrl.org>
Source record: 288999

In rec.radio.amateur.misc, jeffj@seeker.mystic.com (Jeff Jones) writes:

>I am in the process of building my QRP rig from scratch and I am hoping to
>hear from other people on problems they have run across building their own
>rigs. Hopefully this will save me some time and headaches. How hard is it to
>get the coils right? Problems with intermod? Best product detectors?

Jeff,

I have helped many a ham (and myself) get homebrew projects working correctly.
I would conclude that most (>75%) of the time when a project doesn't work,
it is because the builder has made some sort of construction error. The most
common of these are soldering errors -- cold solder joint or short-circuit
"bridge" on a pc board, etc. Most of the others are obvious (in retrospect),
such as:

miswiring (confusing two wires in a group, transposing them)
omitting a wire or connection
incorrect part (wrong value, etc.)
component installed wrong, capacitor polarity, IC in backwards, etc.
<room left for expansion during thread>
<ooops, have I opened a can o' worms here? :-) >

Some of the other problems are not so readily apparent. I recommend using
only first-grade components. If you build things from parts salvaged from
old consumer electronics equipment or flea-market pc boards, sooner rather
than later you are going to use the component that failed to make Aunt
Tilly toss the old radio your way in the first place. Troubleshooting
a failed component can be an adventure! (An adventure is what happens
when things start to go wrong.)

Quite a few of the problem projects I have helped troubleshoot have been
problems because of improper liberties taken with component substitution.
I remember my early building days -- wishful thinking would often color
my judgement. If the only transformer I had on hand was an audio transformer,
I would convince myself that it would work okay at 1.8 MHz, right? (Okay, I
exaggerate here, but you get the idea.) But selecting the wrong ferrite
material, or making improper assumptions about substituting transistors
can get you into trouble.

If you do need to troubleshoot a newly built project, approach it with
the idea that the builder has probably done something wrong. Start with
a careful visual inspection, including a bit of prying compenents around
to uncover a cold or broken solder joint. Then carefully examine any
assumptions that the builder made about component substitutions. After
this deep self-searching, you can move on to conventional troubleshooting

techniques.

Good luck. Perhaps a local wizard or Technical Specialist at your ham club can help out. Sometimes debugging the circuit Charlie built can make a good club activity night (this is best done on a night when Charlie is not there. :-)). 73, Ed

3068. Meeting at Cal Rail Fest...

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-05 20:16:26 UTC
From: raveling@Unify.com
Message-ID: <q6nhpgo@Unify.Com>
Source record: 288994
Cross-posted to: rec.railroad,rec.radio.amateur.misc,rec.aviation

So far it sounds as if at least a few rec.railroad readers
like the idea of meeting for an early dinner in Old Sacramento
during the California Railroad Festival. 5:30 on Saturday,
the 13th, is the target time.

So far the number of people involved looks like somewhere
between 5 and 8. In case you missed the followup where I
proposed details, and would like to join up for dinner,
please email an RSVP to me and give a head count if you're
speaking for more than one person. When the final group
size looks fairly stable I'll pick a restaurant & reserve
in advance.

BTW, this message is cross-posted to rec.radio.amateur.misc and
rec.aviation. The word's out that there's a big railfan contingent
among hams these days, and there just may be a pilot or two
who'd find the California Railroad Festival to be a great
weekend destination.

For those on these other newsgroups who aren't aware of details,
look for recent postings on rec.railroad. Searching for "Fest"
or "CRF" in subject lines will probably find everything that's
available.

Actually, it can go either way. You can come over and use my
station, and my call, and I don't have to be there. You would
be the control operator. Callsigns belong to stations not operators.
As a matter of fact, since club calls are not being issued, this
is the only way you can get a repeater or similar station on the
air now.

Yep, fortunately the ARRL has been doing everything they can to speed up there stuff, including giving out numbers so the VE teams can Express Mail, FedEx, UPS, or AirborneExpress the sessions to them. I'm pretty dilligent about our stuff. The eighty or so exam materials were FedExed the next monday morning after our Saturday exam. It's a lot of work colating those exams and filling in the summary sheet. I figure the neater I make things on my end the less chance it will get screwed up at the ARRL or FCC. I make sure that all the sigs are in place and there were no inadvertent blank spots on the 610. I get a nice postcard from the VEC office shortly thereafter.

The ARRL used to be pretty atrocious about these. I know because they fouled up my advanced ticket. They are better now, really, they are.

One item in ke4zv's list of suggested articles caught my eye:
>> 7) a tutorial on designing and using fast PIN TR switches

Yes! Pleasepleaseplease somebody write one for 73! I hate relays!

I would also like to see a 2m noise bridge. They always seem to cut off at 100 MHz; does the theory not work at the higher frequencies?

On the other hand, I sort of like the QRP articles. I like reading about things I can AFFORD. I wish one of the manufacturers would put out a line of rigs for people like me who can't shell out $$$$. Use todays technology to produce, for example, an HF rig with the features and performance of, say, 25 years ago, at a fraction of the cost.

>You can still get bounce off a sign, overpass, or leading vehicle.

Given similar-sized collecting apertures, you're right. However,
the lidar gun can easily use a telescope with a collecting aperture
several inches in diameter without making the gun too unweildy.
This gives an enormous gain in sensitivity, while making the detector
very directional - which is an advantage at the gun end, since it
rejects signals from all but very close to where the signal is
expected to come from.

But the detector on your car has to be a wide-angle receiver,
so you can't just use a telescope. And a bare photodiode is wide-angle
but can't collect much energy. So simple detectors can't take
as much advantage of the inverse-square law as you'd imply.

You *could* use something like a B&W CCD video camera with an IR filter.
The lens would gather energy, giving a big gain over a plain diode
receptor, yet the area of the CCD array allows covering a wide field
in parallel. And comparing the brightest pixel with its neighbours
would allow you to differentiate between a small very bright IR source
(lidar!) and a much larger dimmer source - something a single diode
couldn't do.

You'd still have to look for some sort of modulation "signature"
on the IR to differentiate lidar from a simple reflection of the sun
off somebody's chrome body part.

>And the same techniques of letting a "rabbit" run ahead of you to flush the
>radar or lidar operator out of the bushes still works as a defensive
>measure. This is a "Wild Weasel" technique used by the military to get
>the opposition to fire up their AAA radars so they can be targeted by
>follow on aircraft with HARM missiles.

But this doesn't work very well with lidar. The beam can be made so
narrow and well-defined that a car near you can be clocked without
your detector ever seeing a thing.

>2: " " " less than lowest " "

I should have said "loop bandwidth" instead of "loop filter bandwidth".

So long as all modulating frequencies are above the loop bandwidth,
injecting the modulation into the VCO input of a PLL will give you
_FM_ modulation. The response to a DC input is zero.

If you want DC response, you could modulate the reference oscillator.
(i.e. make the reference oscillator into a a VCO.) In this case,
you want the PLL loop bandwidth to be greater than the HIGHEST
modulating frequency.

(Loop bandwidth is defined as the frequency at which the PLL feedback
loop gain drops to unity.)

A good article covering this subject is "Design and Optimization of
Frequency Modulated Phase Locked Loops" by Farron L. Dacus in the
March 1992 issue of RF Design magazine. He describes a technique
to allow low-distortion FM modulation of the VCO even if the
loop bandwidth is not below the lowest modulating frequency.

It is the year 1992, anyone can easily send and receive worldwide email from their home with a simple microcomputer running even MSDOS. The environment is laid waste and at least in part by the enormous burden of our paper based beaurocracy of business.

Information, the exchange of ideas is a tremendously powerful commodity. The ability to freely exchange information without delay, without enormous environmental impact should be embraced as a standard.

I believe that the benefits of electronic mail communications with ARRL HQ should not be artificialy limited and nullified by a non use serving policy of requiring postal delivery of printed documents in order to effectively communicate a good idea from the membership.

The great benefits of reliability, utility and efficiency offered by the net to all citizens should be understood and exploited most of all by a group with a charter such as ours.

The job of the ARRL should be to represent the interests of the Amateur Radio Community. By definition, given our charter we are to become better communicators, we are to show others how to communicate better.

Therefore, when officials of the ARRL who are participants in the net discussion groups pertaining to this area of service (and they are to be congratulated, lauded and appreciated for their forward thinking and

dedication to these ideals) receive relevant and useful information from any source, it should be appropriately received. Anything less is unforgivable.

I hate to think we're all working so hard on this culture and science for futile reasons. The sooner we can establish a larger base of citizens with electronic mail addresses and the means to interact with the net, the sooner we can stop those post office killings. :)

Seriously, I just hate it when I hear something like 'Good idea, too bad it wasn't submitted in the proper form' AARRRGGGHHHHHH, Who needs it? No time for such tomfoolery!

What do you think?

3086. Propagation Forecast Bulletin 23 ARLP023

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-06 05:46:06 UTC

ZCZC AP31
QST de W1AW
Propagation Forecast Bulletin 23 ARLP023
>From Tad Cook, KT7H, Seattle, WA
June 6, 1992
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB PROP ARL ARLP023
ARLP023 Propagation de KT7H

Radio amateurs were no doubt dismayed last week as solar cycle 22
continued its dramatic drop. Two weeks ago we reported a new solar
flux low for this side of the cycle, 113 for May 17. The flux had
not been this low since May 2, 1988. On three days last week, May
30 through June 1, the flux dropped below 100, which is the lowest
it has been since February 28, 1988.

With such low solar activity, the geomagnetic field has been quite
stable, but the Maximum Usable Frequency is depressed. The most
dramatic effect is on 10 meters. The best all around ham band right
now is that old standby 20 meters, which is open most hours of the
day to somewhere. For nighttime propagation, 30 and 40 METERS are
the best. We are in the season for sporadic E propagation, so 6
meter buffs can expect short skip openings on that band.

For the forecast week look for the solar flux to edge up slightly
and reach a peak of only about 145 toward the middle of the month.
then it should slide back down toward 100 again before July 4.

Some of the data for these bulletins is provided by the NOAA Space
Environment Service Center and Cary Oler of the Solar Terrestrial
dispatch of Alberta, Canada. The STD BBS can be reached at
403-756-3008.

Sunspot numbers from May 28 through June 3 were 98, 47, 59, 54, 45,
72 and 108, with a mean of 69. 10.7 CM solar flux for the same
period was 110.9, 105.2, 99, 99, 98.6, 102 and 106.9, with a mean of
103.1.

> wallet.

I guess I should come to their defense based on an experience I had
with Quement. About 2 years ago I bought an Icom R71A from them. I paid
cash late in the afternoon one Saturday. I took it home and fiddled with
it for the weekend and decided that I simply didn't like it considering
its relative performance with my then benchmark R390A and considering
the price I paid.

I went back with it on Monday in the orig box with no visible defects
(everything still looked new) and told them I was dissatisfied with the
receiver as it simply had not measured up to my expectations. The
manager looked it over carefully and cheerfully refunded my money!
He told me that they have sold lots of the R71A's and knew that they
would have no trouble finding a buyer that did like the receiver. I thanked
them and left.

To me this was truly amazing: a CASH refund!

Anyhow, that's my Quement story.

3089. QRP vs. Bells and Whistles

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-06 11:44:35 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9206061145.AA20453@cmr.ncsl.nist.gov>
Source record: 289009

I've been finding the QRP/homebrew discussion interesting. Let's consider, however, WHY the commercially-produced rigs have all those Bells & Whistles. IMHO, the WHY is simple - they are very cheap. Zillions of 'VFOs', really just memory locations, are easy once you stick a microprocessor in the rig. The reproduction cost is next to nothing. Likewise scanning ..... Rigs, like a lot of things, seem to be sold by features. It is next-to-impossible to evaluate the RF performance of a rig in a few minutes in a store, but you CAN see the fancy display, count the memories, etc. How many 'integrated entertainment centers' have you looked behind. There is the BIG and fancy molded plastic front, but just a little box or so behind, where the works are.

Just an observation,
73, Bob W3OTC

>above 450, too...

While I agree that ATV belongs above 450 MHz, it's not as bleak as you make it sound. The QAM signal fits in spectral holes in the existing waveform, but it is dispersed too. It's not like the color subcarrier or the sound carrier that concentrate energy in one place. A typical ATV repeater puts out 75 watts or less. The bulk of that power is confined to within 15 kHz of the visual carrier. Most of the power in a TV waveform is sync, negative modulation remember. There are two other strong peaks, the color subcarrier 3.58 MHz above the visual carrier, and the aural carrier 4.5 MHz above the visual carrier. The aural carrier is 10 db down from the visual carrier, and the color subcarrier is less than that.

The rest of the energy, about 1/8th the carrier power, is spread fairly evenly across 4.2 MHz, depending on picture content. In any given 20 kHz, the power is around 23 milliwatts at the ATV transmitter output. Now contrast that to the typical 100 watt narrow band repeater output on the same frequency. Remember the ATV signal is AM and the repeater is FM. At a user's receiver the FM signal is going to capture the receiver in nearly every case. Only if the user lives under the ATV repeater and the FM repeater he's listening to is a hundred miles away will there be troublesome interference.

This is really a non-issue for bandplan repeaters that operate high in, low out. It *is* a serious issue for the ATVers though. They get clobbered by the strong FM signals in their picture passband. That's why I think they should move above 450 MHz. That, and the fact that FM TV works much better than AM TV and there's plenty of space for

FM TV above 450 MHz. The downside for the ATVers is mobile operation. In the microwave bands that can be difficult. In commercial TV we use 2 GHz for most of our truck to station links while reserving 7 GHz and 23 GHz mainly for fixed links where we can use 8 foot dishes. Paths become more critical as frequency increases.

>
> The FCC plans to announce its selection of HDTV system next February.

What I would really like to see the FCC do is to move all HDTV up to
UHF and reallocate the VHF TV band to land moble service like the
Brits did in the UK. I believe the inherent efficiency of digital
TV will cause all kinds of same channel interference on VHF under
current mileage zones esspecially during Tropo conditions. The FCC
could pack far more stations into the basically unused UHF TV band.
(besides how many home shopping stations do we need on UHF - argh!!)
The resulting VHF band could be carved up for all kinds of services
some not yet developed and many digital that continue to look at the
amateur alllocations as ripe for the picking (remember the 220!!!).
(Get the pun - the Texans will.)

Now, if this happened and the ARRL happened to be on the ball, they
could lobby for the 4m band. Yes I said 4m band. This band is used
widely through out the UK commonwealth and has some interesting
characteristics. We would also have a wealth of state of the art
TV's that we could use for EXPERIMENTATION!!!!!!! (novel thought).

3092. (Not really) QRP vs. Bells & Whistles

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-06 12:14:46 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9206061215.AA20462@cmr.ncsl.nist.gov>
Source record: 289010

In my recent posting I opined that All Those Bells and Whistles are in commercial rigs because they are SOOoooo cheap to reproduce.

I then had a Thought (gasp). Why should I curse my all-singing, all-dancing microcomputer-rich rig where the digital dial reads 2+ kHz wrong on 2 meters, because one of the many internal crystal oscillators needs a little trimming? Why should they even bother to put (expensive-to-adjust) trimmers on the crystals - expect the injection oscillator which has to match the IF filter?? It should be snap for the microprocessor to have an "dial error" register whose contents are an offset between what the synthesizer thinks the frequency is and the actual frequency. This (these) registers would have to be in the non-volatile memory, and could be initially loaded in a fully-automated test stand at the factory - using the remote control input to the rig. Why not?

A user proceedure would allow corrections to be updated for crystal drift, etc.

>
>>Oh, how I miss HR Mag.
>

>Hey, who doesn't?

As someone, who shall remain nameless remarked to me in Email, the cardboard covers of QEX are the thickest thing about it. Even if it were published Quarterly (;-)), it would still be mighty thin. The idea of an experimenter's exchange is good, but QEX hasn't managed to pull it off. Discussions *here* are often more technical, and certainly longer. :-) I'm not saying the fault lies with the ARRL. It lies with potential authors for failing to live up to the purpose of QEX. I don't recall seeing a single Fourier transform since the inception of QEX.

But, as anyone who does it can tell you, VHF/UHF/SHF is *easier* for
the home builder than HF. No bulky coils, just nice striplines. No
nasty discrete transistors going spurious everywhere, just nice MMIC
gain blocks that are unconditionally stable. Gain antennas that can be
built by apartment dwellers, *inside* their living rooms. Voice
receivers are as easy as CW receivers, often easier since single
chip receiver systems are available. Single chip voice and data
transmitter designs are also available. I can build in a *weekend*
VHF/UHF/SHF transceivers that are *superior* in RF performance to
many commercial designs. Doing that on HF is a major feat. HF is
a very hostile RF enviornment. It's hard to get good performance
from simple equipment there.

>>Surely a 5-watt 2-meter FM HT is 'QRP' too?
>
>It certainly qualifies by power, but the QRP-operation enthusiasts might argue
>that there is no challenge in just working those repeaters you can hear without
>any scratch in the sound (attempting to set a distance record on simplex,
>however...).

So QRP enthusiasts are just sicker than normal DXers, eh? Sorry, that's
a cheap shot, at least they do build something. Still, this idea that
only breaking *distance* records counts in ham radio is annoying. What's
wrong with putting a *quality* voice signal on the band for local work?
What's wrong with putting some *content* into QSOs? How many of these
HF DXers can break the distance records of VHF/UHF *moonbouncers*? I
doubt many can claim half million mile contacts. How many have a clue as
to how to setup and run a packet network? (Some big gun DXers *are*
technically astute, I'm painting with a broad brush I know.)

>(On the third hand, if the Pegasus launcher manages to gain popularity, maybe
>we can start seeing QST articles entitled "Yet Another Personal MicroSat"...)

Unrelated to ham radio, but yet another flame. :-(
How come everyone is so excited about Pegasus? It's payload is no better than the venerable Scout that has been launching since 1961, and they cost the same, $10 million per launch. The Scout doesn't need a 36 year old B52 to carry it two thirds of the way to space either. Pegasus and Scout have the highest cost per pound to orbit of any currently active launcher. They aren't the low cost spread. That title goes to Energia and Titan IV. Maybe Long March too, but who knows the Chinese's real costs. Microsats piggyback as *ballast* on *big* launchers. It's almost always cheaper to ship by rail than by bicycle.

>>> Our local newspaper states that the oscillator is at 13.56 MHz.

>Let's just hope all those light bulbs are crystal controlled, so half
>of them don't drift up to 20 meters!

My question is: How clean are those signals? I have a feeling they
would be pretty rich in harmonics and just plain messy. Anyone out
there know?

Source record: 289021

Stephen Saunders, KD6EUT writes..

>The following is an article my mother sent me about Heathkit from
>the Chicago Tribune (Sunday, May 3, 1992). I hope some of you
>find it enjoyable. Has anyone ever seen (or flown) a Parasol?

> Pulling the Plug

>By Ron Grossman

> ST. JOSEPH, Mich. - A factory here is shortly to become the
>Wailing Wall of a now-graying generation of nerds.

(ARTICLE DELETED)

Yes, found the article VERY enjoyable. Thanks for taking the time to
place the article on the net. The current discussion on the net about
Ramsey, just points out what we will be missing without Heathkit.

Thanks again, and by the way, I think I saw a Parasol right there in your Air
Museum in San Diego......I may be wrong but seems to tingle the memory.

No, QRP is the only reason I'm upgrading and learning CW....
only way I can afford to get into HF and learn how to make my
own stuff and keep to the portable battery-powered format I prefer.
Though I wish they'd stop printing that "other stuff" in QST....
maybe a new mag is in order devoted to just QRP and portable
VHF/UHF ops....something like "QRP Monthly"...while we're at it
maybe we should petition the FCC to limit the power in AT LEAST
portions of the HF bands to 10 watts or so for non-emergency ops.
;@} ;@} ;@} should do wonders for balance-of-trade and technical
training.... ;@} ;@} ;@}

Subject : RACES BULLETINS-BY-TOPIC

RACES BULLETINS-BY-TOPIC is a RECOMPILATION of all RACES bulletins
from l985 through l991 into CATEGORIES and TOPICS. It provides a vaulable
reference for the Emergency Services Manager, Coordinator and Radio Officer.
There are five major categories, with sub-topics as shown:
MGT - MANAGEMENT: An Overview (20 articles); Emergency Management-What to
Expect (3); Mutual Aid (7); Organization (21); Policy Matters (6) Radio
Officer (9).
OPS - OPERATIONS: Aspects (5); Incident Command System [ICS] (2); In Time
Need (5); Preparedness for Responders & their Family (7); Training (7);
What to Expect in Emergencies (4).
MISC - MISCELLANEOUS: Miscellaneous (24); Public Relations and Press (1);
Public Safety (2); RACES Survey (1); Earthquake (1)
TEC - TECHNICAL: Antenna's (5); ATV (3); Equipment (9); Packet (5);
Technical Tidbits (2).
TIM - Time Related (0) [Items that have a time-limited usefulness.]
Both versions (disc & print) include: contents, cross reference to
original bulletin, introduction, addresses/phone numbers.
The printed version includes an 11 page RACES Policy Guide; 13 page
Net Control Station Responsibilities Guide; 4 page "The Volunteer, a
Valuable Human Resource"; 4 page Strike Team guide; Organization Chart
with relationship to local government; Standards for RACES; A County
Training Plan for RACES Personnel; Using Tactical Calls; Organization
Flow Charts, Forms< maps and articles of various nature.
Both versions are available from RACES, T-Comm Division, Office
of Emergency Services, 2800 Meadowview Road, Sacramento, Ca 95832 as
follows: Disc - Send formated floppies (2) or Disc (1 DSDD 3.5") with
Self Addressed and Stamped Return Mailer. (ASCII format)(If Macintosh
please specify). Print - Send $10 check payable to State of California
(is at cost and includes shipping/postage) [3 ring punched, ready to
insert in your binder.]
Questions? Write/packet query: Cary Mangum, W6WWW, Chief Radio
Officer, California Office of Emergency Services. Personal Packet is:
W6WWW @ KD6XZ.#NOCAL.CA.USA.NA. OES official packet: W6HIR @ WA6NWE.CA

RACES Bulletins are archived on the Internet at ucsd.edu in hamradio/races
and can be retrieved using FTP.

Our repeater (PI3EHV) had similar problems. After a while, we got the
HDTP (people issuing licenses here) to put some effort in this.
They watched the address for some more time and found other things
as well (activities on 3 meter etc).
The guy got a free 'shack cleanup' and of course, he lost his license.

Good luck, it may take some time to get this over with.

3106. RACES Bulletin #225

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 01:59:26 UTC
From: enge@almaden.ibm.com
Message-ID: <9206070159.AA01115@ucsd.edu>
Source record: 289027

Msgid: $RACESBUL.225

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.225 DATE: June 8, 1992
SUBJECT: MGT: Activation of a RACES unit. Part 1/3

Justifiably, agency officials react with strident alarm if RACES people are called out without jurisdictional authority, or if non-RACES operators (for example, ARES-only members not co-registered in a RACES unit) are called out in a RACES situation.

Of even deeper concern by agency officials is the Radio Officer who can't discern one from the other, and confuses the call-up, causing embarrassment to an official or the jurisdiction; exceeding authority or creating liability problems for administrators. Once 'burned', such officials can become reluctant or refuse to utilize the unit again.

RACES activation is based on specified authority of the local jurisdiction. This should be spelled out in a written RACES plan for each jurisdiction. The Radio Officer should ascertain that the plan is active, current and approved, as well as reading the activation language provisions. A time-tested RACES plan is the model Santa Luisa Plan. Sending a draft of your plan to State OES HQ for review, prior to filing the final signed-off plan, helps assure that the activation authority is clear and concise.
(To be continued)

SpaceNews
=========

MONDAY JUNE 8, 1992

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* FO-20 SCHEDULE *
==================
Fuji-OSCAR-20 normally operates its Mode JD packet radio transponder on
all orbits. During the following periods, the Mode JD transponder will
be switched off and the analog Mode JA transponder will be switched on:

10-Jun-92 02:50 UTC -to- 11-Jun-92 03:11 UTC
17-Jun-92 03:15 UTC -to- 18-Jun-92 01:15 UTC
24-Jun-92 01:50 UTC -to- 25-Jun-92 02:10 UTC

[Info via Kazu Sakamoto, JJ1WTK]

* SATELLITE LOG *
=================
The following transmissions were received by Lawrence Harris of Devon, UK
during the month of April:

NOAA 9 137.62 MHz TX all month - visible channel 2 and infrared channel
4 continuously, ie., no change during night time part of orbit.

NOAA 10 137.50 MHz Off for first few days during clash with NOAA 12.
NOAA 11 137.62 MHz Normal operations all month.
NOAA 12 137.50 MHz Normal operations all month.

METEOR 3-3 Off all month.
METEOR 3-4 137.30 MHz Continuous TX all month. Infrared during night part
of orbit, then visible during sunlight. Change from visible to
IR is instantaneous for some passes, but on others, it changes
first to bars only, for four minutes, then bars and white level
for one minute, then normal IR. No obvious correlation with
anything. Problem from 27th with IR scan showing large black
areas in picture.

METEOR 3-5 137.40 09/0825 UTC note unusual frequency (OKEAN). Off for
next pass.

METEOR 2-18 Possible TX received for few seconds 06/1938 UTC during sunlight
over north pole. No further TX heard, but no other WXSAT in
right place.

METEOR 2-19 137.85 MHz TX normal in sunlight only. Approached terminator
and was turned off from 9th.

METEOR 2-20 137.85 MHz TX from 08/1440 UTC in sunlight.
FENGYUN 1-2 137.80 MHz No TX received.

METEOSAT-3 1691 MHz Fair signal from its position at 50 degrees west.
METEOSAT-4 1691/1694.5 MHz Normal operations, but some data corruption
occasionally evident in pictures.

METEOSAT-5 No TX noted.
GOES 2 1691 MHz TX normal but weak from the UK. Elevation varies from
1 degree to about 20 degrees. Unstabilized.

OKEAN 3 137.40 MHz No pictures received.
RS14/AO21 (Informator 1) 145.815 MHz heard regularly.
MAGION 3 137.85 MHz and 137.15 MHz heard regularly, sometimes
simultaneously.

UoSAT-2 (OSCAR-11) 145.825 MHz heard occasionally.
DOVE DO-17 heard regularly on 145.825 MHz.
MOS 1 & -1B 136.12 MHz heard regularly.
Transit 5BN 5 136.65 MHz heard regularly.
PROSPERO X3 heard regularly on 137.56 MHz.
Mir 143.625 MHz TX heard regularly.
COSMOS 2026 Heard on 149.97 MHz.
COSMOS 2154 Heard on 149.94 MHz.
COSMOS 2074 Heard on 149.91 MHz.
COSMOS 2181 Heard on 150.00 MHz during month.
Nadezhda 3 150.00 MHz heard regularly.
No TX heard from Nadezdha 1.

[Info via Lawrence Harris]

3109. BULLETIN: New Ionospheric E-Mail Services Available

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 09:16:13 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.707908573@honte>
Source record: 288882
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

SOLAR BULLETIN

07 June, 1992

Ionospheric Data Services Available

/\

EXPERIMENTAL IONOSPHERIC DATA SERVICE NOW AVAILABLE

An experimental service to begin providing a daily summary of
ionospheric data is being considered. The service will become operational
for a review period in order to determine whether the ionospheric community
is interested in seeing these services continue.

Comments are therefore solicited regarding the implementation of these
services. The daily reports would contain ionospheric MUF, FOF2 and Total
Electron Content (TEC) data for numerous ionospheric stations around the
world.

A sample report for 06 June has been appended below. These daily
reports will be distributed through a new mailing list. For those who are
already on our mailing list, you must explicitly request to be added to this
new mailng list. If you are on our list(s), send your request to:
Oler@Rho.Uleth.CA, or to: COler@Solar.Stanford.Edu.

For those of you who are not on our mailing list and are only interested
in this data for amateur or personal non-professional purposes, please
attempt to subscribe to the listserver at lut.fi (ex. "listserv@lut.fi").
Subscribe to the list "SOLAR-DAILY" if you are interested in obtaining this
material directly through e-mail. Only those with a professional interest
are encouraged to subscribe directly with us as opposed to the publically
available listserver at lut.fi in order to maintain an efficient mailing
list. If you require assistance on subscribing to the listserver at lut.fi,
send an e-mail message to: "listserv@lut.fi" containing ONLY the word "HELP"
in the _body_ of the message. Subject headers are ignored. Messages to
listservers should not contain any signatures as this may confuse the
listserver. After sending a message containing the word "HELP", the
listserver should respond through e-mail with valid commands and general
help. If all else fails, send a request for help to: Oler@Rho.Uleth.CA, or:
COler@Solar.Stanford.Edu.

Posting of the daily ionospheric data to the CANSPACE listserver at
unb.ca will only be implemented if the owners of that list specifically

request the data be forwarded there. If you are receiving this through that list and are interested in seeing the material posted to the CANSPACE list, post a public message expressing your interest (or disinterest) so the owner(s) can determine the level of interest that exists.

These daily ionospheric data summaries will be archived at the anonymous FTP site: xi.uleth.ca (IP number 142.66.3.29) in the "pub/solar/Iono" directory at about the same time as the daily summaries of solar activity.

Finally, note that this service may be discontinued if support is too low or if data availability becomes a problem. It must be stressed that this service is experimental.

The sample daily ionospheric data summary for 06 June follows below:

```

>for the other bands. Comments?

I wouldn't bring in the jackhammers yet. The simplest solution is to
insure that you have a low impedance path to your grounding system for
the harmonics of your 6 meter signal. You want a good low impedance path
at the 6 meter fundamental, a halfwave ground run should do that, and it
sounds like that's already the case. That should be a full wave on the
second harmonic, and that's good, and a 3/2 wave on the third harmonic,
that's also good. To avoid trouble on other bands, an old trick is to
run several ground wires of *different* lengths to the same ground rod.
One should be low impedance on each of the bands of interest.

I doubt, however, that this is the source of your harmonic problem.
I would first suspect a faulty connection in your ground system. Clean
and tighten the connections first and see if that cures your problem.
From your description, the most likely candidate is a *rectifying* junction.
Whether a transmitter is grounded *at all* or not shouldn't make a difference
in it's harmonic output. Harmonic radiation is the result of amplifier
operating point and tank and output filter design. Ideally, no harmonic
energy ever leaves the cabinet of the transmitter.

Grounding is only necessary for protection and to provide a *return*
circuit for unbalanced antennas. It's not usually a cure for harmonic
radiation.

3111. Re: Help with Rural QRP Rig

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 13:05:03 UTC
From: gary@ke4zv.uucp
Message-ID: <1992Jun7.130503.2021@ke4zv.uucp>
Source record: 288886

In article <1992Jun5.154116.154@ccsvax.sfasu.edu> z_vaughanja@ccsvax.sfasu.edu writes:
>Does anyone know of a relatively inexpensive QPR rig that will actually
>pick up a signal in a rural area in the 20, 40, or 80 meter bands?

All of them, except broken ones will. The problem is generally that
they pick up *too many* signals at the same time. Two somewhat elderly
commercial QRP rigs that work well are the Argonaut 509 and the Yaesu
FRG7 (is that right?). Or you can always crank down the power control
on an IC735.

Most of the homebrew designs in the magazines, and the Handbook, also
work fine. The big problem is the need for an antenna tuner with most
of them. Often that winds up being the biggest part of the station.
In the tube days, a random wire 20 feet long was sufficient to bring
any receiver to life, but with today's solid state rigs optimized
for a 50 ohm match, a tuner is a must on receive as well as transmit,
unless you have a perfect antenna and few of us do.

Even DC, direct conversion, receivers work fine in rural areas, less
hum pickup. They can be surprisingly sensitive, but selectivity sucks.

Your best bet is to pick a design that uses single conversion superhetrodyne
to the common 9 MHz IF. Filters are widely available. I picked up a pair
at Dayton for $5 each. New filters can be bought from many sources including
Spectrum International. The advantage of the 9 MHz IF is that one 5-5.5 MHz
VFO can serve for both 80 and 20 meters. Other bands are best served by
first converting to 80 meters with a crystal converter. I like the packaged
DBMs, double balanced mixers, from Mini Circuits for the front end mixer,
but others like a dual gate MOSFET. Product detectors commonly use the
Motorola MC1496G four quadrant multiplier, but another DBM will work
here too. The IF gain block is critical to a good receiver. There are
several chips that will serve. The old CA3028A is tried and true.

The area of VFO design is critical in homebrew projects. It's still
hard to make a clean, stable, linear tuning oscillator for HF. A
series tuned Colpitts is a good choice. The problem is that the tuning
capacitor is big. Voltage tuned varactor circuits can be used, but
linear tuning is hard and stability of the tuning voltage is critical.
DDS, direct digital synthesis, is becoming practical at HF. This is
as complex as the rest of the receiver combined, but being digital,
is straightforward to construct, and tuning can be arbitrarily fine.
Digital readout comes almost for free.

I'm sure others have their own ideas about the best circuits for
a small receiver. Transmitters are trivial by comparison.

> ANYTHING!
>
>
> Wally Blackburn AA8DX
> wrb@ccsitn.att.com

Sure they will print anything because the choice of anything to print
is so limited and lousy. Send it in to both and you will get REAL
MONEY from 73. Now if some of the others out there would write some
variety of projects and submit them, QST and 73 would have something
else besides QRP articles to publish. I would but I do not yet have
the technical expertise. I am just trying to find a decent project
to build.

3113. Re: Amateur HDTV anyone?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 13:58:35 UTC
From: brian@ucsd.edu
Message-ID: <10t4mclNNpq1@network.ucsd.edu>
Source record: 288883

I'd be very interested in seeing actual measurements of the signals
emitted from the various (two or three) models of commercially-manufactured
ATV transmitters.

My impression is that most of the transmitters people use locally are
completely devoid of any lower sideband filtering. They're filthy.
Are there, in fact, ANY clean ATV transmitters on the market?
- Brian

3114. METEOR SHOWERS BY RADIO

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 14:01:40 UTC
From: andromed@cs.dal.ca
Message-ID: <BpHAys.DDq@cs.dal.ca>
Source record: 288885

Was wondering if there was anyone out there monitoring meteor showers by radio methods and if so were are the results published ?

Thanks

Just out of curiousity, Geert, what's on 3 metres in Holland anyway?
Over here it's FM Broadcast.

One of the other possibilities is to use an NE-602 as a downconverter for an automotive broadcast radio, and then add a bfo. The car radios are reasonably selective, and sensitive, and that way all the mechanical work in the receiver is already done for you.

SB NEWS @ AMSAT < PA2WJZ $25526_PI8EAE
Mirnews 132

MIRNEWS.132 30 MAY 1992

The cosmonauts o.b. MIR have been working on experiments instead of repairing and replacing life-support equipment. They used a camera named Liva for earth-observations and mentioned the areas of which they had to make videorecordings.
The crew also used equipment for the Austrian experiments of Austromir. They worked on a few of those experiments in coordination with an expert on TsUP. Monimir (reflexes under micro-gravity) and Migmas (raster ion microscope) of which the data with the device Datamir are transmitted via MIR's telemetry channels. The continuation of experiments with equipment left behind by guest cosmonauts must be of a great advantage: funds for Russian spaceflight and the fact that the Austrians have constructed the equipment not only for the short stay on board MIR of Franz Viehbock in Oct. 1991.

THE EX-TRACKING FLEET: Some of the ships of that fleet are still seaborne, but not for tracking or relay purposes. During the last weeks there have been messages that the Kosmonavt Yuriy Gagarin, the K. G. Dobrovolskiy, the K.V. Komarov and the K.P. Belyayev left their homeports. Obviously the ships made short cruises. It took some investigation work to get the following information: the Russians decided to keep the ships floating and to maintain the original shape as to make the ships 'attractive' for foreigners during cruises and business trips and eventual expeditions. Important persons involved in spaceflight, science and commerce founded some organisations to use the ships for cruises and business promotion trips. They already started one or more cruises. One of the travel agencies is leaded by the former cosmonaut Beregovoy. If they pay 350 thousand rubles cosmonauts and spaceflight employees can enjoy a cruise. A few days ago the Kosmonavt Pavel Belyayev showed up in radiocontacts with the MIR station. So just as it has been before: MIR traffic in the West while MIR was still out of range of Yevpatoriya. The Belyayev visited Hamburg and the mayor of that city greeted the cosmonauts. Some experts on board kept the transceiver for MIR communications in good order and the scientist and tradesmen on board Belyayev spoke with the cosmonauts. The ship does not work for TsUP and on 30 May, during orbit 35950, 1106-1117UTC wondered with whom the crew has been speaking. On 1 June the ship will visit London and some important passengers on board will speak with MIR during orbits 35982 (1049-1100UTC) and 35983 (1225-1235UTC). Some scientist and tradesmen on board will try to promote Russian products and look for partners for commercial and scientific cooperation. There will be not much propaganda for spaceflight for they do not have much material on board. They have photographs, but no TV-films. Viktorenko told the ship that he regretted this. The Belyayev will be involved in a number of events in relation to the Columbus-92 expeditions and Viktorenko promised

that the MIR-crew if necessary and possible will cooperate and assist. There are rumours that an ex-trackingship (Belyayev or Dobrovolskiy) will visit Rotterdam for 2 days around 10 June 1992.

3118. Disneyworld/KSC repeaters

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 19:28:23 UTC
From: mosbrook@beach.csulb.edu
Message-ID: <1992Jun7.192823.21917@beach.csulb.edu>
Source record: 288891

I am going to be vacationing in Florida for a week, and would like to find a couple 440 or 2 meter repeaters to stay in touch with fellow travelers... Are there any recommendations for the Disneyworld/KSC areas? also, does Disney allow HT's in the park?

BTW: any interesting police/security freqs to occupy possible hotel time with?

Thanks
Brent

One of the other possibilities is to use an NE-602 as a downconverter for an automotive broadcast radio, and then add a bfo. The car radios are reasonably selective, and sensitive, and that way all the mechanical work in the receiver is already done for you.

3120. SUMMARY: Yes there is a 1750 Meter band

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 20:30:26 UTC
From: jerryp@key.COM
Message-ID: <3310@key.COM>
Source record: 288894

As requested by several people, here is a collection of highlights
of the replies I recieved to "Does 1750 meters really exist". It
looks like one of the replies was from a FAQ list, but since I got
several requests to summarize, I'll go ahead and consume the
bandwidth.

Many thanks to all that took the time to reply. And many thanks
to all those who caught the error in my .sig. I guess I'll go
listen to the tapes some more :-).

Thanks again.

73s,
jerryp@key.amdahl.com
KC6RTO
-=

From alan@dsd.es.com Wed Jun 3 06:43:44 1992
(K6X0)
...yes, Virginia, there is a real citizen's band between
160 and 190 KHz. The limitations are: one watt output power, and
the antenna can be no longer than 50 feet including the feedline.
There are some serious experimenters using the band for propagation
studies and so on, but there is lots of room for CW signals. You
may hear several beacons operating there 24 hours a day. There is
a newsletter, but I do not know who publishes it. Other than the
power and antenna restrictions, as far as I know anything goes.
To my knowledge there is no commercially made equipment available
for this band - virtually everyone builds their own transmitters,
and most of the modern receivers will tune down on that band. I
listen there once in a while with my TS-930 but have never been
interested in transmitting there. Good luck.

****

From: frankb@hpsad.sad.hp.com (Frank Ball)
(KC6WUG)

...FCC part 15 (no license) 1750 meter band: 160-190 KHz. 1 watt max
input power. 15 meter maximum lenght of antenna + feedline. With
those power and antenna restrictions you don't get much range.

****

From jkearman@arrl.org Fri Jun 5 07:55:06 1992
(KR1S) ^^^^
|------(AhHA! - So much for the benign neglect theory -- JRP)

JP: Well, shucks. We have run articles about this band in the past. I guess we should do it again. The band runs from 160-190 kHz. You're allowed 1-watt output, total length/height of antenna including feed line is 50 ft (max allowed by law). Most folks put the xmtr right at the base of the antenna.

You can join the Longwave Club of America, which was organized in 1974 to promote DXing and experimentation on frequencies below 550 kHz and activity on the 1750 meter band. Membership in the LWCA and a one-year subscription to The LOWDOWN is $12.00 by First Class Mail. Please make all remittances payable to the Longwave Club, and mail to LWCA, 45 Wildflower Rd., Levittown, PA 19057. [Direct quote from the LOWDOWN]

(See, we READ it here!)

The LOWDOWN is published monthly. Good luck and 73,

****

>From: pdh@netcom.com (Phil Howard)
(KA9WGN)

Depending on your effective bandwidth, you can extend it. I've read about very slow digital going something like 1000 to 2000 km.

****

From: pulse@meaddata.com (Tom Hesley)

As promised, here's the summary of the information I requested from the net a couple weeks ago regarding the 1750 meter band.

Does one need a license to operate on this band? No. This means that you can choose your own callsign although callsigns are not required.

What is this band for? Experimentation mainly. It is especially fun to attempt QRP operation and one respondent said that given the right type of modulation and antenna setup, signals can travel 1000 miles or more with just under one watt output! Lots of folks use CW beacons and there is a radio club called The Lowfers (Low Frequency Users, presumedly). Be aware that this IS NOT a ham band although several LF receiver manufacturers boast that their units can "receive the 1750-meter ham band". You will not find discussion of this band in the ARRL publications BECAUSE it is not a ham band. Perhaps some of the confusion here arises from the use by LF operators of ham radio callsigns. Many hams also operate in this band and use their own calls for identification, even though, as mentioned above, a callsign is not required here.

What is the frequency limits of this band? The 1750 meter band spans from 160 to 190 KHz.

What types of modulation may be employed? You may use CW and AM voice. You may be allowed others (FM, RTTY, etc). But the data I was able to gether was sketchy on this point. One person though said that there

are no restrictions on modulation methods.

What are the legal power limits and other transmitter-related restrictions? Transmitter power is limited to somewhat less than one watt output. The maximum power INPUT to the final should not exceed one watt. The length of the antenna added to the length of the feedline MAY NOT exceed 50 feet. Spurious emissions outside the band must be 60db below the signal strength at the carrier frequency.

Who may use the band? Anyone, so long as they comply with the above regulations.

Where can I get more definitive and detailed information on this band? The band is discussed in Part 15 of the Code of Federal Regulations which you can pick up at your local library (assuming it is a fairly big library), or you can order it from the nearest US Government Bookstore. If anyone knows where such a store is, please post its location. I'd like to snag a copy of Part 15 myself.

Thanks to alan@dsd.es.com, kludge@grissom.larc.nasa.gov, kc2wz!bob%fdurt1@uunet.UU.NET, brown@hpspkla.spk.hp.com, markz@ssc.wa.com, and gary@ke4zv.uucp for all the information they provided.

Happy Lowfering! :-)

PHASE 3D TELECONFERENCE SET

HR AMSAT NEWS SERVICE BULLETIN 158.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.01
TO ALL RADIO AMATEURS BT

* PHASE 3D TELECONFERENCE PLANNED *
==========

The first National Teleconference Radio Net (NTRN) in two years will take place on Sunday evening, July 12, at 6 PM EDT (22:00 UTC). The topic will be "PHASE 3D: A HAM SATELLITE FOR EVERY RADIO AMATEUR." The two hour session will be moderated by Roy Neal (K6DUE), and will feature (among other guests) AMSAT-NA President Bill Tynan (W3XO) and AMSAT-NA Director of Development Joe Schroeder (W9JUV).

To reserve a port on the 200 line interactive teleconference bridge, a repeater owner or trustee must send a self addressed post card to the Phase 3D NTRN, Bill Pasternak (WA6ITF), 28197 Robin Avenue, Saugus, CA 91350. Please send post cards only and the accompanying letter of request MUST contain the following information:

1) Repeater Callsign
2) Location
3) Estimated number of users
4) Name, address and telephone number of licensee/trustee
5) operating frequency

Note: Ports on the Minneapolis based Teleconference Bridge will only be made avalable to repeaters and wide-area bulletin stations.

Also, those repeaters tied into Jim Bass "Let's Talk Radio Network" on GTE Spacenet 3 will be able to downlink the NTRN on a listen-only noninteractive basis.

AMSAT members are urged to encourage operators of repeaters in their areas to sign up to carry the teleconference as well as to spread the word about it among local hams and clubs.

[The AMSAT News Service (ANS) wishes to thank KB2BD and SpaceNews for this information.]

KB5MU DECODES 2ND DOVE MESSAGE

HR AMSAT NEWS SERVICE BULLETIN 158.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.02
TO ALL RADIO AMATEURS BT

KB5MU Decodes Second DOVE Voice Message Using DSP

In last week's ANS-151.01 bulletin, it was stated that the original DOVE voice message, which said "You are listening to DOVE MICROSAT" had become garbled and unintelligible. However, DOVE Recovery Team member Paul Williamson (KB5MU) using a state-of-the-art Digital Signal Processing (DSP) device -- the human ear -- was able to decipher the speech sounds and found the message quite intriguing. According to KB5MU, the second message was "roll over, Beethoven." But in order to be absolutely sure, KB5MU recorded the message and played it backwards and listened again. What he heard astonished him even more! He concluded that the second DOVE message played backwards was a message from Elvis! He further concluded that the DOVE voice message had purposely been changed by Martians who were indeed Elvis fans. After serious consultation with another member of the DOVE Recovery Team, Jim White (WD0E), they both came to the conclusion that the message played backwards said "take me to your leader." WD0E stated he would be more than happy to comply with the space aliens request but he was not sure who his leader was. AMSAT News Service (ANS) Editor Dave Cowdin (WD0HHU) would like to solict additional comments as to the interpretations of the second voice message transmitted by DOVE. The orginal theory that the first DOVE voice message had been changed through a simple software "bug" was apparently seized upon too easily by the ANS editors. Therefore the ANS would like to solict additional comments on the second DOVE message, what it means and how it got changed. Communicate your ideas to WD0HHU on CompuServe at his address of 70524,2272 or to his INTERNET address of wd0hhu@amsat.org.

SB SAT @ AMSAT $ANS-158.03
AO-13 ATTITUDE PLANNING: PART I

HR AMSAT NEWS SERVICE BULLETIN 158.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.03
TO ALL RADIO AMATEURS BT

G3RUH & VK5AGR Explain AO-13 Attitude Planning: Part I

Graham (VK5AGR) has often been asked why the attitude of AO-13 is continually being changed once every couple of months, so I thought it might be appropriate to include some printouts from a program by G3RUH called ILLPLAN, an abbreviation for "Illumination Planner."

The header of each chart gives the date, SEL (the elevation of the Sun above or below the orbital plane), SAZ (the azimuth of the Sun around the orbital plane), WP (the value for the Argument of Perigee on the date displayed - as per keplerian elements), RAAN (the value for the right ascension of the Ascending Node on the date displayed - as per keplerian elements) and IN (the satellite's orbital inclination).

The next line is labelled LA/LO and the values from 260 to 90 degrees are displayed and represent the attitude of the satellite in longitude. The column of numbers down the left represent the attitude of the satellite in

latitude between the values of + and - 15 degrees.

The numbers in the center of each printout represent the Sun Angle in degrees for each combination of Attitude Longitude and Latitude. The per centage illumination of the solar panels = 100*COS(Sun Angle) and AO-13 needs 70% or better solar panel illumination to maintain full transponder operations. In other words the Sun Angle must lie somewhere between + or - 45 degrees.

/EX
SB SAT @ AMSAT $ANS-158.04
AO-13 ATTITUDE PLANNING: PART II

HR AMSAT NEWS SERVICE BULLETIN 158.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.04
TO ALL RADIO AMATEURS BT

AO-13 Attitude Planning Explained by G3RUH & VK5AGR: PART II

The significance of the plus and minus signs and the blank areas is that for those values of attitude Latitude and Longitude the Sun angle is either less than -45 degrees or greater than +45 degrees; in other words, UNDESIRABLE.

I have chosen the dates of all the planned attitude changes for the remainder of 1992 to try and demonstrate why there is a need for the attitude changes.

1992 Jun 8 [Mon] SEL= -24.12 SAZ= 125.9 WP= 287.6 RAAN= 22.54 IN= 56.7

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90
-------------------------------------------------------------------------------
15 | --- -37 -28 -19 -10 -1 8 16 24 32 39 44 +++ +++ +++ +++ 43 37
10 | -44 -35 -26 -17 -8 1 10 19 27 35 42 +++ +++ +++ +++ +++ +++ 41
5 | -42 -33 -24 -15 -6 3 12 21 30 38 +++ +++ +++ +++ +++ 45
0 | -39 -31 -22 -13 -4 <5> 14 23 <32> 41 +++ +++ +++ +++
-5 | -37 -28 -20 -11 -2 7 17 26 35 43 +++ Sun here +++ +++
-10 | -34 -26 -17 -9 0 9 18 28 37 +++ +++ at 126/-24 +++
-15 | -31 -23 -15 -6 2 11 20 29 38 +++ +++ +++
-------------------------------------------------------------------------------
```

Looking at the printout for 8-Jun-92, if the attitude was to be left at Longitude 180 degrees and Latitude 0 degrees ("180/0"), which is the most desirable attitude for antenna pointing, you can see that the Sun Angle is 32 degrees which is very close to the undesirable area, whereas with an attitude of 210/0 the Sun angle is only 5 degrees, or 99.5% illumination.

/EX
SB SAT @ AMSAT $ANS-158.05
AO-13 ATTITUDE PLANNING: PART III

HR AMSAT NEWS SERVICE BULLETIN 158.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.05
TO ALL RADIO AMATEURS BT

If you compare this with the next printout for 92-Jul-20 you can see that the "undesirable" area is right in the center of the printout, which will necessitate moving the attitude to the other side of this area via an attitude of 180/15.

1992 Jul 20 [Mon] SEL= -34.22 SAZ= 175.7 WP= 291.1 RAAN= 14.79 IN= 56.7

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90
-------------------------------------------------------------------------------
15 | -4 4 12 19 25 31 36 39 <41> 40 39 35 30 24 18 11 3 -5
10 | -1 7 15 22 29 35 40 44 +++ 45 43 40 34 28 21 14 6 -2
5 | 2 10 18 26 33 39 45 +++ +++ +++ +++ 44 38 32 25 17 9 1
0 | 5 13 21 29 36 <43>+++ +++ +++ +++ +++ +<> 42 35 28 20 12 4
-5 | 7 16 24 32 40 +++ +++ +++ +++ +++ +++ 39 31 23 15 6
-10 | 10 19 27 35 43 +++ +++ Sun here +++ +++ 42 34 26 17 9
-15 | 13 21 29 38 +++ +++ at 176/-34 +++ 45 37 28 20 12
-------------------------------------------------------------------------------
```

This means that while the reorientation is in progress, and even at 150/0 the Sun angle is still not anywhere optimum either for solar illumination or for antenna pointing. One option that was considered was to leave the attitude at 180/15 rather than continuing to 150/0 but from previous experience a latitude much greater than 5 degrees results in relatively poor antenna pointing angles, which makes communicationing harder. So generally controllers maintain the latitude as close to 0 degrees as possible and just adjust the longitude.

1992 Sep 21 [Mon] SEL= -2.093 SAZ= 241.3 WP= 296.5 RAAN= 1.353 IN= 56.97

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90
-------------------------------------------------------------------------------
15 | +++ +++ 36 27 17 8 -2 -11 -21 -31 -40 --- ---
10 | +++ +++ 38 28 18 8 -2 -12 -21 -31 -41 ---
5 | Sun here +++ +++ 38 28 18 8 -1 -11 -21 -31 -41 ---
0 | at 241/-2 +++ +++ 39 <29> 19 9 <-1>-11 -21 -31 -41 ---
-5 | +++ +++ 39 29 19 9 -1 -11 -21 -31 -41 ---

-15 | +++ +++ 38 28 19 9 -1 -10 -20 -29 -39 --- ---
-------------------------------------------------------------------------------
```

By 21-Sep-92 controllers can once again afford to change the attitude back to the more desirable attitude (for the antennas) of 180/0 with a Sun Angle of 29 degrees. Also you can see that the undesirable area has drifted further to the left of the printout as the Sun moves around it own orbit.

1992 Nov 23 [Mon] SEL= 33.06 SAZ= 304.9 WP= 301.8 RAAN= 349.6 IN= 56.97

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90
-------------------------------------------------------------------------------
15 | +++ 37 29 21 12 4 -4 -12 -19 -25 -31 -36 -40 -42 -42 -40 -36 -32
10 | 43 35 26 18 10 1 -7 -15 -22 -29 -35 -41 -45 --- --- -45 -41 -36
5 | 40 32 24 15 7 -1 -10 -18 -25 -33 -39 -45 --- --- --- --- -45 -40
0 | 36 29 21 13 4 <-4>-12 -21<-29>-36 -43 --- --- --- --- --- --- -43
```

-5 | 33 26 18 10 2 -7 -15 -24 -32 -40 --- --- --- --- --- ---
-10 | 29 22 15 7 -1 -10 -18 -26 -35 -43 --- --- --- ---
-15 | 26 19 12 4 -4 -12 -20 -29 -37 -45 --- ---

In the last printout which is for 23-Nov-92 the undesirable area is creeping in from the right, and will continue to drift from right to left. If the attitude was left unchanged at 180/0 the Sun Angle would soon be less than -45 degrees. So a move to 210/0 is planned for that date to restore the Sun Angle to -4 degrees.

I hope that the above tables and explanation has helped you understand why AO-13 Command Stations have continually to compromise antenna pointing to meet solar panel illumination requirements.

AO-13 OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 158.06 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.06
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and Mode J/L on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

20-Jun-92 2000 B 146 WA5ZIB WJ9F
5-Jul-92 0200 B 118 W9ODI N7NQM
11-Jul-92 2300 B 225 W5IU WA5ZIB

Guest commentators are planned. Join the net if you have questions. In the unlikely event that either the NCS or the alternate do not call on frequency, any participant is invited to act as net control.

****

Slow Scan Television on AO-13

Starting Sunday, 14 June 1992 the SSTV net will meet on a downlink frequency of 145.925 MHz, Mode B at MA 165, UTC Sundays. Also try Mode J, UTC Saturdays at MA 165, frequency of 435.980 MHz. Try the various AMSAT Nets for scheduling at other times.

AO-13 Early Summer Schedule Announced

The early summer schedule for AO-13 is as follows:

N QST 1992 May 08 AO-13 Transponder Schedule Jun 10 - Jul 20
Mode-B : MA 000 to MA 165 ! Mode-JL on Mon, Wed !
Mode-JL : MA 165 to MA 200 ! Fri and Sat UTC only. ! Alon/Alat
Mode-LS : MA 200 to MA 215 ! S Beacon on "L" days ! 210/0
Mode-B : MA 215 to MA 256 ! S Transp on "B" days +----------/
Omnis : MA 250 to MA 060 ! Mode L OFF after Jun 23 until
Aug 17. Next attitude change Jul 20, to 150/0 until Sep 21.
73 de Peter DB2OS, James G3RUH and Graham VK5AGR.

L QST de G3RUX. 92May08. AO-13 Calendar for remainder of year:
Date Event Modes Sun Angle SEL/SAZ

1992 Jun 08 [Mon] Move to 210/0 B JL S 5 -24/126
1992 Jun 29 [Mon] L OFF B -- - 24 -33/149
1992 Jul 20 [Mon] Move to 150/0 B -- - 43 to 47 -74/176
1992 Aug 17 [Mon] L ON B JL S 28 -26/208
1992 Sep 21 [Mon] Move to 180/0 B JL S -1 to 29 -2/241
1992 Nov 23 [Mon] Move to 210/0 B JL S -29 to -4 33/305
1992 Dec 14 [Mon] L OFF B -- - -27 33/333
1992 Dec 28 [Mon] t.b.a. 43 29/351

SEL/SAZ is Sun's position in orbit plane (like ALAT/ALON). Move
Jul 20 to 150/0 because Sun is at SAZ=176 i.e. apogee direction
and thereafter around SAZ=208 - 240. Interesting! 73 James

AO-10 is currently available for Mode B operation when it is view of your
QTH. PLEASE DO NOT attempt to use AO-10 if you hear the beacon or the
transponder signals FMing.

PHASE 3D TELECONFERENCE SET

HR AMSAT NEWS SERVICE BULLETIN 158.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.01
TO ALL RADIO AMATEURS BT

* PHASE 3D TELECONFERENCE PLANNED *
==========

The first National Teleconference Radio Net (NTRN) in two years will take place
on Sunday evening, July 12, at 6 PM EDT (22:00 UTC). The topic will be "PHASE
3D: A HAM SATELLITE FOR EVERY RADIO AMATEUR." The two hour session will be mod-
erated by Roy Neal (K6DUE), and will feature (among other guests) AMSAT-NA Pres-
ident Bill Tynan (W3XO) and AMSAT-NA Director of Development Joe Schroeder
(W9JUV).

To reserve a port on the 200 line interactive teleconference bridge, a repeater
owner or trustee must send a self addressed post card to the Phase 3D NTRN, Bill
Pasternak (WA6ITF), 28197 Robin Avenue, Saugus, CA 91350. Please send post
cards only and the accompanying letter of request MUST contain the following in-
formation:

1) Repeater Callsign
2) Location
3) Estimated number of users
4) Name, address and telephone number of licensee/trustee
5) operating frequency

Note: Ports on the Minneapolis based Teleconference Bridge will only be made
avalable to repeaters and wide-area bulletin stations.

Also, those repeaters tied into Jim Bass "Let's Talk Radio Network" on GTE
Spacenet 3 will be able to downlink the NTRN on a listen-only noninteractive ba-
sis.

AMSAT members are urged to encourage operators of repeaters in their areas to
sign up to carry the teleconference as well as to spread the word about it among
local hams and clubs.

[The AMSAT News Service (ANS) wishes to thank KB2BD and SpaceNews for this in-
formation.]

KB5MU DECODES 2ND DOVE MESSAGE

HR AMSAT NEWS SERVICE BULLETIN 158.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.02
TO ALL RADIO AMATEURS BT

KB5MU Decodes Second DOVE Voice Message Using DSP

In last week's ANS-151.01 bulletin, it was stated that the original DOVE voice
message, which said "You are listening to DOVE MICROSAT" had become garbled and
unintelligible. However, DOVE Recovery Team member Paul Williamson (KB5MU)
using a state-of-the-art Digital Signal Processing (DSP) device -- the human ear
-- was able to decipher the speech sounds and found the message quite intrigu-
ing. According to KB5MU, the second message was "roll over, Beethoven." But in
order to be absolutely sure, KB5MU recorded the message and played it backwards
and listened again. What he heard astonished him even more! He concluded that
the second DOVE message played backwards was a message from Elvis! He further
concluded that the DOVE voice message had purposely been changed by Martians who
were indeed Elvis fans. After serious consultation with another member of the
DOVE Recovery Team, Jim White (WD0E), they both came to the conclusion that the
message played backwards said "take me to your leader." WD0E stated he would be
more than happy to comply with the space aliens request but he was not sure who
his leader was. AMSAT News Service (ANS) Editor Dave Cowdin (WD0HHU) would like
to solict additional comments as to the interpretations of the second voice mes-
sage transmitted by DOVE. The orginal theory that the first DOVE voice message

had been changed through a simple software "bug" was apparently seized upon too
easily by the ANS editors. Therefore the ANS would like to solict additional
comments on the second DOVE message, what it means and how it got changed. Com-
municate your ideas to WD0HHU on CompuServe at his address of 70524,2272 or to
his INTERNET address of wd0hhu@amsat.org.

SB SAT @ AMSAT $ANS-158.03
AO-13 ATTITUDE PLANNING: PART I

HR AMSAT NEWS SERVICE BULLETIN 158.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.03
TO ALL RADIO AMATEURS BT

G3RUH & VK5AGR Explain AO-13 Attitude Planning: Part I

Graham (VK5AGR) has often been asked why the attitude of AO-13 is continually
being changed once every couple of months, so I thought it might be appropriate
to include some printouts from a program by G3RUH called ILLPLAN, an abbrevia-
tion for "Illumination Planner."

The header of each chart gives the date, SEL (the elevation of the Sun above
or below the orbital plane), SAZ (the azimuth of the Sun around the orbital
plane), WP (the value for the Argument of Perigee on the date displayed - as
per keplerian elements), RAAN (the value for the right ascension of the Ascend-
ing Node on the date displayed - as per keplerian elements) and IN
(the satellite's orbital inclination).

The next line is labelled LA/LO and the values from 260 to 90 degrees are
displayed and represent the attitude of the satellite in longitude. The
column of numbers down the left represent the attitude of the satellite in
latitude between the values of + and - 15 degrees.

The numbers in the center of each printout represent the Sun Angle in
degrees for each combination of Attitude Longitude and Latitude. The per
centage illumination of the solar panels = 100*COS(Sun Angle) and AO-13
needs 70% or better solar panel illumination to maintain full transponder opera-
tions. In other words the Sun Angle must lie somewhere between + or -
45 degrees.

/EX
SB SAT @ AMSAT $ANS-158.04

AO-13 ATTITUDE PLANNING: PART II

HR AMSAT NEWS SERVICE BULLETIN 158.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.04
TO ALL RADIO AMATEURS BT

AO-13 Attitude Planning Explained by G3RUH & VK5AGR: PART II

The significance of the plus and minus signs and the blank areas is that for those values of attitude Latitude and Longitude the Sun angle is either less than -45 degrees or greater than +45 degrees; in other words, UNDESIRABLE.

I have chosen the dates of all the planned attitude changes for the remainder of 1992 to try and demonstrate why there is a need for the attitude changes.

1992 Jun 8 [Mon] SEL= -24.12 SAZ= 125.9 WP= 287.6 RAAN= 22.54 IN= 56.7

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100
90
-------------------------------------------------------------------------------
15 | --- -37 -28 -19 -10 -1 8 16 24 32 39 44 +++ +++ +++ +++ 43
37
10 | -44 -35 -26 -17 -8 1 10 19 27 35 42 +++ +++ +++ +++ +++ +++

+++
-15 | -31 -23 -15 -6 2 11 20 29 38 +++ +++
+++
-------------------------------------------------------------------------------
```

Looking at the printout for 8-Jun-92, if the attitude was to be left at Longi-
tude 180 degrees and Latitude 0 degrees ("180/0"), which is the most desirable attitude for antenna pointing, you can see that the Sun Angle is 32 degrees which is very close to the undesirable area, whereas with an attitude of 210/0 the Sun angle is only 5 degrees, or 99.5% illumination.

/EX
SB SAT @ AMSAT $ANS-158.05
AO-13 ATTITUDE PLANNING: PART III

HR AMSAT NEWS SERVICE BULLETIN 158.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.05
TO ALL RADIO AMATEURS BT

If you compare this with the next printout for 92-Jul-20 you can see that
the "undesirable" area is right in the center of the printout, which will
necessitate moving the attitude to the other side of this area via an
attitude of 180/15.

1992 Jul 20 [Mon] SEL= -34.22 SAZ= 175.7 WP= 291.1 RAAN= 14.79 IN=
56.7

12

This means that while the reorientation is in progress, and even at 150/0
the Sun angle is still not anywhere optimum either for solar illumination
or
for antenna pointing. One option that was considered was to leave the
attitude at 180/15 rather than continuing to 150/0 but from previous
experience a latitude much greater than 5 degrees results in relatively
poor
antenna pointing angles, which makes communicationing harder. So generally
controllers maintain the latitude as close to 0 degrees as possible and
just
adjust the longitude.

1992 Sep 21 [Mon] SEL= -2.093 SAZ= 241.3 WP= 296.5 RAAN= 1.353 IN=
56.97

LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100

-15 | +++ +++ 38 28 19 9 -1 -10 -20 -29 -39 ---
---
--------------------------------------------------------------------------
```

By 21-Sep-92 controllers can once again afford to change the attitude back to the more desirable attitude (for the antennas) of 180/0 with a Sun Angle of 29 degrees. Also you can see that the undesirable area has drifted further to the left of the printout as the Sun moves around it own orbit.

1992 Nov 23 [Mon] SEL= 33.06 SAZ= 304.9 WP= 301.8 RAAN= 349.6 IN= 56.97

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100

--------------------------------------------------------------------------
15 | +++ 37 29 21 12 4 -4 -12 -19 -25 -31 -36 -40 -42 -42 -40 -36
-32
10 | 43 35 26 18 10 1 -7 -15 -22 -29 -35 -41 -45 --- --- -45 -41
-36
5 | 40 32 24 15 7 -1 -10 -18 -25 -33 -39 -45 --- --- --- --- -45
-40
0 | 36 29 21 13 4 <-4>-12 -21<-29>-36 -43 --- --- --- --- --- ---
-43
-5 | 33 26 18 10 2 -7 -15 -24 -32 -40 --- --- --- --- ---
---
-10 | 29 22 15 7 -1 -10 -18 -26 -35 -43 --- --- ---
---
-15 | 26 19 12 4 -4 -12 -20 -29 -37 -45 ---
---
--------------------------------------------------------------------------
```

In the last printout which is for 23-Nov-92 the undesirable area is creeping in from the right, and will continue to drift from right to left. If the attitude was left unchanged at 180/0 the Sun Angle would soon be less than -45 degrees. So a move to 210/0 is planned for that date to restore the Sun Angle to -4 degrees.

I hope that the above tables and explanation has helped you understand why AO-13 Command Stations have continually to compromise antenna pointing

WD6EAT%debisa@mccall.com
I have been carrying my HT in my briefcase on airlines for a number of years.
I have never tried to use it on the plane, although I understand from other's
that this is possible with permission from the pilot. I did, indeed, speak
with an amateur who was at 32,000 ft over El Paso, TX several years ago aboard
a commercial airliner.

3125. DX Bulletin OPDX #64 June 8, 1992

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 22:22:08 UTC

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 064 (OPDX.064)
June 8, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, K4CEF & Southeastern Cluster Group, ARRL, DXNL, DF4RD, WB3LHD, WK3N, NC7K, NW8F and KQ8M for the following DX information.

3V, TUNISIA. A station signing 3V8AD showed up on 14025 and 18073 kHz around 1645 and 1530z this week. The operator stated to QSL to DJ0AD. There is a big possibility that this is a SLIM. But WFWL!

4U1VIC, AUSTRIA. Bob Boone, WB4FNH, will be active from here June 14 to July 4. Bob is a resident of Bradenton, Flordia.

4S0, SRI LANKA. A group of UK operators will be active from 4S starting June 11 to July 4. The group will activate a new prefix, 4S0UK. A special QSL card will be available for the call. Each operator will have their own 4S call: G0LUH/4S7DGG, G0MRF/4S7DBG, G0OHW/4S7JVG AND G0ONA/4S7PNG. They will be active on SSB/CW/RTTY/AMTOR. Look for them on 20/15/10/6 meters. They will be active in the ALL Asian DX Contest. QSL via G8PDW.

9M8, EAST MALAYSIA. 9M8ZZ has been very active on 18 MHz this past weekend around 1330 to 1700z. The following stations have also been active: 9M8AJ 21247/1622z, 9M8DB 14226/1400z (net) and 9M8FH 14226/1345z.

ARRL JUNE VHF QSO PARTY. Time for the ARRL June VHF QSO Party. The event runs from 11:00 AM Saturday the 13th through 8 P.M. Sunday the 14th, PST. The goal in this contest is to work as many different stations as possible on as many bands as possible, while working as many grid squares as possible. For this event, Tim, NC7K, will be at 8933 Ft. atop Virginia peak in grid square DM09 (Reno, Sparks, Carson area) with radios for 50.125, 144.200, and 432.100 Mhz SSB/CW. In addition, 146.55, 223.50, and 446.00 FM simplex will be used for contacts with those who do not have "Weak Signal" gear. Tim will have 6 radios running continuously listening for contacts.

BV, TAIWAN. BV2CT has been active almost daily around 14026 kHz between 1300 to 1500z. QSL via NO0C. BV2FA has been active on the 14226 DX net around 1330z and on 18071 kHz around 1545z. QSL to: Shane Tang, P.O. Box 3-167, Yungho, 23498 Taiwan (via DJ9ZB is OK).

D4, REPUBLIC OF CAPE VERDE. Julio, D44BC, was active Sunday on 21260 kHz at 1700z. He also sometimes shows up on 7180 at 0630z during a net.

J5, GUINEA BISSAU. Cecil, NW8F, states he is the QSL Manager for Mark, J5UAI. Mark is a new addition to the U.S. embassy and he will be there for 1.5 years. Mark is a U.S. Novice and has much to learn about working pile ups. (This is new to him, so go easy on him.) He prefers the CW mode and can be found in the Novice band on 15 meters. It has also been reported Mark has been active (SSB) around 21327 kHz at 1530z. Cecil says he will be receiving the J5UAI cards this Wednesday (6/10) and he will begin sending them out on Thursday.

OD5, LEBANON. NODXA member, Walid, OD5ZZ, states he will be on OSCAR 13 very soon (In about a week.).

OH0, ALAND ISLAND. Erkki, OH2BBF, was active as OH0BBF this past weekend (6/3-7), but by the time you read this he will have gone QRT. Erkki will be returning to the island June 16-21. For future references, he was active on the following frequencies : 18088 kHz around 1630z, 21010 kHz arouund 1450z and 24891 kHz at 1732z. QSL via OH2BBF.

S9, Principe Island. Marcel, ON4QM, will be active as S92QM until June 15. Marcel has been active 21295, 21308, 18150 and 14195 between 2000 to 2300z. He has also been heard on 28475 kHz around 1615z. QSL via ON4QM.

T30, WEST KIRIBATI. Bing, VK2BCH, is expected to be active from here as T30AA beginning June 11. His length of stay is unknown. QSL via VK2BCH.

TT8, CHAD. Bart, K4CEF, reports more frequencies and times for TT8ZH: 1846 kHZ around 0300z, 3502 at 0400z, 7025 at 0500z, 10102 at 2000z, 18136 at 1700z and 24940 at 1800z. His sunrise is at 0440z and sunset is at 1720z. Henri (F6BAZ), TT8ZH says he is on 80 meters at 2200z on 3515, which should be a good time for the upper East Coast.

VA8A CARDS. Tim, KQ8M, informs OPDX that he brought back all cards received for "ALL" the VA8A QSO's and as soon as the cards are printed he will be answering all cards. He expects to receive the VA8A QSLs in approximately 2 to 3 weeks. Anyone that has sent for a VA8A card from last year's operation, PLEASE do not resend. Tim promises to get the cards out ASAP.

VR6, PITCAIRN ISLAND. VR6BX was active on RTTY this past weekend on 15 meters. Check between 21080 to 21090 kHz starting around 1900z and as late as 0230z. QSL to Brian Young, Box 21, Pitcairn Island.

ZA, ALBANIA. As of January, Albania has reciprocal operating licenses. The licenses for foreign radio amateurs are issued for a period of three months and can not be renewed during the same year. Foreign callsigns will be ZA/(your call). A packet of laws is being put together and license applications will be handled by th Albania Radioamateur Association (AARA) at P.O. Box 66, Tirana.

ZC, UK SOV. BASE AREA ON CYPRUS. ZC4AB has been active on RTTY on 15 meters. Check around 21090 kHz at 0400z. QSL to Alan Bramley, JSB British Forces P.O. Box 53, London, England, U.K.

Excerpts and distribution of The OPDX Bulletin are granted as long as
OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS

3126. Standard C5608D

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-07 23:13:00 UTC
From: msw1633@summa.tamu.edu
Message-ID: <7JUN199218135675@summa.tamu.edu>
Source record: 288896

Hello all...

I just got back from Ham-Com in Arlington, Tx. and while there, I became infatuated with the Standard C5608D Twin-Bander. Does anyone have any comments regarding this radio? Does anyone own one? I thought it was great, personally. It seemed much simpler to use, as I sometimes have difficulty figuring out the functions on radios of a similar nature from Icom and Kenwood, etc... Of course, I was impressed with the almost full control from the microphone (everything except crossband repeat and accessing the 900 MHz receive range), but the radio seemed very sturdy and well built. You can't really get the full picture of a radio from a manufacturer's display... you need to get the rig into a vehicle and see how it goes. Just wondering if anyone has such experience...

Thanks!

3127. Alinco DR-590T Bug report.

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-08 00:14:26 UTC
From: yoony@aix.rpi.edu
Message-ID: <2ykw8p+@rpi.edu>
Source record: 288897

I have recently noticed a bug in my Alinco DR-590T. When either band is in scanning mode, a memory write function in the other band is not possible. I unknowingly tried to save a frequency and when I get back to the memory channel, it would not be there. Please let me know if anyone else has experienced this problem. This problem may exist in the DR-599 as well, since the two radios are quite similar. I have noticed this problem after I got a CPU upgrade from Alinco. This problem may have existed before the brain transplant. But I only noticed it after.

3128. Wide recieve on Standard C168A

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-08 01:43:38 UTC
From: og@access.digex.com
Message-ID: <1992Jun8.014338.2665@access.digex.com>
Source record: 288904

I discovered that I could set the C168A to accept frequency selections
from 0-399.999 MHz. Anything outside this range and the unit bleeps as
no good entry. Does anyone know what the true wide receive range is for
this radio? I may be able to tune that wide, but I haven't been able to
hear anything. I know I can hear the weather channels and I can pick
up 103.5 (a music station in DC). Any help at all will be appreciated.

Some relevent E-lamp data:

any tpyos my fault.

.....
Source:
Columbus Dispatch, Sun. Jun 07 1992, p. 6F
History of E-Lamp is Enlightening
Michael B. Lafferty, Dispatch Science reporter

"...Don Hollister successfully lit a gas-filled bulb with a radio wave in 1975."

"Hollister's idea and his company, Litec, were purchased by Diablo Lighting and eventually by Diablo Research. Interscource licensed the technology from Diablo Research."

"...Intersource, the Sunnyvale, Calif., company which annouced the development of the E-lamp at the annual meeting of the Edison Electric Institute in Columbus, last week."

[stuff about 1/4 of energy, save the earth, and long life deleted]

"American Electric Power invested $6.5 million in the research for 9.9 percent of the company..."

[operating principal previously described in sci.electronics deleted]

"The bulbs life is based on it losing 30 percent of its lighting capacity after 20,000 hours, about 20 years in normal residential lighting, pezzolo said."

[Don Pezzollo is chief engineer at Intersource]

[paragraph with important information follows]

"When that happens, [THAT == IT LOSES 30 PERCENT OF ITS LIGHTING CAPACITY] consumers will be able to buy, for about $5, a phosphor-coated replacement glass to use over the light producing part of the bulb. The old coated glass is removable. Since it is only the glass covering and not the entire bulb that is replaced, the cost is less."

"The bulb is now slightly larger than a conventional incandescent bulb ...the E-lamps will fit about 70 percent of existing sockets. Continued improvements ... will allow production of bulbs that will fit all sockets."

"By concocting different mixtures of the phosphor coating, the bulbs
can be made to glow red, green, blue or various shades of white,
Pezzolo said."

Source record: 288871

Organization: Employer not involved in this.

As requested by several people, here is a collection of highlights of the replies I recieved to "Does 1750 meters really exist". It looks like one of the replies was from a FAQ list, but since I got several requests to summarize, I'll go ahead and consume the bandwidth.

Many thanks to all that took the time to reply. And many thanks to all those who caught the error in my .sig. I guess I'll go listen to the tapes some more :-).

Thanks again.

73s,
jerryp@key.amdahl.com
KC6RTO
-=

From alan@dsd.es.com Wed Jun 3 06:43:44 1992
(K6X0)
...yes, Virginia, there is a real citizen's band between 160 and 190 KHz. The limitations are: one watt output power, and the antenna can be no longer than 50 feet including the feedline. There are some serious experimenters using the band for propagation studies and so on, but there is lots of room for CW signals. You may hear several beacons operating there 24 hours a day. There is a newsletter, but I do not know who publishes it. Other than the power and antenna restrictions, as far as I know anything goes. To my knowledge there is no commercially made equipment available for this band - virtually everyone builds their own transmitters, and most of the modern receivers will tune down on that band. I listen there once in a while with my TS-930 but have never been interested in transmitting there. Good luck.

****

(KC6WUG)

...FCC part 15 (no license) 1750 meter band: 160-190 KHz. 1 watt max input power. 15 meter maximum lenght of antenna + feedline. With those power and antenna restrictions you don't get much range.

****

From jkearman@arrl.org Fri Jun 5 07:55:06 1992
(KR1S) ^^^^

|------(AhHA! - So much for the benign neglect theory --
JRP)

JP: Well, shucks. We have run articles about this band in the past.
I guess we should do it again. The band runs from 160-190 kHz. You're
allowed 1-watt output, total length/height of antenna including
feed line is 50 ft (max allowed by law). Most folks put the xmtr
right at the base of the antenna.

You can join the Longwave Club of America, which was organized in
1974 to promote DXing and experimentation on frequencies below
550 kHz and activity on the 1750 meter band. Membership in the
LWCA and a one-year subscription to The LOWDOWN is $12.00 by
First Class Mail. Please make all remittances payable to the
Longwave Club, and mail to LWCA, 45 Wildflower Rd., Levittown,
PA 19057. [Direct quote from the LOWDOWN]

(See, we READ it here!)

The LOWDOWN is published monthly. Good luck and 73,

****

>From: pdh@netcom.com (Phil Howard)
(KA9WGN)

Depending on your effective bandwidth, you can extend it. I've read
about very slow digital going something like 1000 to 2000 km.

****

As promised, here's the summary of the information I requested
from the net a couple weeks ago regarding the 1750 meter band.

Does one need a license to operate on this band? No. This means that
you can choose your own callsign although callsigns are not required.

What is this band for? Experimentation mainly. It is especially fun to
attempt QRP operation and one respondent said that given the right type
of modulation and antenna setup, signals can travel 1000 miles or more
with just under one watt output! Lots of folks use CW beacons and there is
a radio club called The Lowfers (Low Frequency Users, presumedly). Be
aware that this IS NOT a ham band although several LF receiver manu-
facturers boast that their units can "receive the 1750-meter ham band".
You will not find discussion of this band in the ARRL publications
BECAUSE it is not a ham band. Perhaps some of the confusion here arises
from the use by LF operators of ham radio callsigns. Many hams also
operate in this band and use their own calls for identification, even
though, as mentioned above, a callsign is not required here.

What is the frequency limits of this band? The 1750 meter band spans
from 160 to 190 KHz.

What types of modulation may be employed? You may use CW and AM voice. You may be allowed others (FM, RTTY, etc). But the data I was able to gether was sketchy on this point. One person though said that there are no restrictions on modulation methods.

What are the legal power limits and other transmitter-related restrictions? Transmitter power is limited to somewhat less than one watt output. The maximum power INPUT to the final should not exceed one watt. The length of the antenna added to the length of the feedline MAY NOT exceed 50 feet. Spurious emissions outside the band must be 60db below the signal strength at the carrier frequency.

Who may use the band? Anyone, so long as they comply with the above regulations.

Where can I get more definitive and detailed information on this band? The band is discussed in Part 15 of the Code of Federal Regulations which you can pick up at your local library (assuming it is a fairly big library),
or you can order it from the nearest US Government Bookstore. If any-one knows where such a store is, please post its location. I'd like to snag a copy of Part 15 myself.

Thanks to alan@dsd.es.com, kludge@grissom.larc.nasa.gov, kc2wz!bob%fdurt1@uunet.UU.NET, brown@hpspkla.spk.hp.com, markz@ssc.wa.com, and gary@ke4zv.uucp for all the information they provided.

Happy Lowfering! :-)

Well, I've never tried to use an HT on the plane but I prefer not
to place it in checked luggage. First, I usually get to the terminal
early and use it to pass time. Second, and perhaps more importantly, I
have had luggage "misplaced" by the airlines and now take anything I'll
need during my stay (that can't easily be replaced) in my carry-on or
on my person. It's easy to buy new clothes in a strange city, but HTs,
tech reference books, etc. may not be available in the local mall.

Just something to consider.

3134. Membership/mailing list management programs?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-08 05:54:17 UTC
From: btbg1194@uxa.cso.uiuc.edu
Message-ID: <BpIJ2J.8A8@news.cso.uiuc.edu>
Source record: 288901

I am looking for a good membership/mailing list management program which
will run on PC's and/or Mac's and/or unix/C.

The ideal program would allow you to keep more than one address per member
(e.g., campus & other), as well as additional information about each member.
This program would allow you to print out mailing labels in a semi-sophisticated
way, as well as to organize the database by different fields, etc.

I would be interested to hear about *good* commerical programs, but I would
especially like to hear about good, public domain programs with C source
(which could be used on unix and pc systems simultaneously).

Thanks in advance for your suggestions and advice.

The most popular units are made by PC Electronics, AEA, and Wyman. PC
does not have VSB filtering. AEA does and I believe the Wyman unit
does, just by virtue of its price tag. At any rate these are all CLEAN
by amateur standards. Why do you ask??

============================================================

SB SAT @ AMSAT $ANS-158.01
PHASE 3D TELECONFERENCE SET

HR AMSAT NEWS SERVICE BULLETIN 158.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.01
TO ALL RADIO AMATEURS BT

* PHASE 3D TELECONFERENCE PLANNED *
==================================

The first National Teleconference Radio Net (NTRN) in two years will take place
on Sunday evening, July 12, at 6 PM EDT (22:00 UTC). The topic will be "PHASE
3D: A HAM SATELLITE FOR EVERY RADIO AMATEUR." The two hour session will be mod-
erated by Roy Neal (K6DUE), and will feature (among other guests) AMSAT-NA Pres-
ident Bill Tynan (W3XO) and AMSAT-NA Director of Development Joe Schroeder
(W9JUV).

To reserve a port on the 200 line interactive teleconference bridge, a repeater
owner or trustee must send a self addressed post card to the Phase 3D NTRN, Bill
Pasternak (WA6ITF), 28197 Robin Avenue, Saugus, CA 91350. Please send post
cards only and the accompanying letter of request MUST contain the following in-
formation:

1) Repeater Callsign
2) Location
3) Estimated number of users
4) Name, address and telephone number of licensee/trustee
5) operating frequency

Note: Ports on the Minneapolis based Teleconference Bridge will only be made
avalable to repeaters and wide-area bulletin stations.

Also, those repeaters tied into Jim Bass "Let's Talk Radio Network" on GTE
Spacenet 3 will be able to downlink the NTRN on a listen-only noninteractive ba-
sis.

AMSAT members are urged to encourage operators of repeaters in their areas to
sign up to carry the teleconference as well as to spread the word about it among
local hams and clubs.

[The AMSAT News Service (ANS) wishes to thank KB2BD and SpaceNews for this in-

KB5MU DECODES 2ND DOVE MESSAGE

HR AMSAT NEWS SERVICE BULLETIN 158.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.02
TO ALL RADIO AMATEURS BT

KB5MU Decodes Second DOVE Voice Message Using DSP

In last week's ANS-151.01 bulletin, it was stated that the original DOVE voice message, which said "You are listening to DOVE MICROSAT" had become garbled and unintelligible. However, DOVE Recovery Team member Paul Williamson (KB5MU) using a state-of-the-art Digital Signal Processing (DSP) device -- the human ear -- was able to decipher the speech sounds and found the message quite intriguing. According to KB5MU, the second message was "roll over, Beethoven." But in order to be absolutely sure, KB5MU recorded the message and played it backwards and listened again. What he heard astonished him even more! He concluded that the second DOVE message played backwards was a message from Elvis! He further concluded that the DOVE voice message had purposely been changed by Martians who were indeed Elvis fans. After serious consultation with another member of the DOVE Recovery Team, Jim White (WD0E), they both came to the conclusion that the message played backwards said "take me to your leader." WD0E stated he would be more than happy to comply with the space aliens request but he was not sure who his leader was. AMSAT News Service (ANS) Editor Dave Cowdin (WD0HHU) would like to solict additional comments as to the interpretations of the second voice message transmitted by DOVE. The orginal theory that the first DOVE voice message had been changed through a simple software "bug" was apparently seized upon too easily by the ANS editors. Therefore the ANS would like to solict additional comments on the second DOVE message, what it means and how it got changed. Communicate your ideas to WD0HHU on CompuServe at his address of 70524,2272 or to his INTERNET address of wd0hhu@amsat.org.

AO-13 ATTITUDE PLANNING: PART I

HR AMSAT NEWS SERVICE BULLETIN 158.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.03
TO ALL RADIO AMATEURS BT

G3RUH & VK5AGR Explain AO-13 Attitude Planning: Part I

Graham (VK5AGR) has often been asked why the attitude of AO-13 is continually being changed once every couple of months, so I thought it might be appropriate to include some printouts from a program by G3RUH called ILLPLAN, an abbreviation for "Illumination Planner."

The header of each chart gives the date, SEL (the elevation of the Sun above or below the orbital plane), SAZ (the azimuth of the Sun around the orbital plane), WP (the value for the Argument of Perigee on the date displayed - as per keplerian elements), RAAN (the value for the right ascension of the Ascending Node on the date displayed - as per keplerian elements) and IN (the satellite's orbital inclination).

The next line is labelled LA/LO and the values from 260 to 90 degrees are displayed and represent the attitude of the satellite in longitude. The column of numbers down the left represent the attitude of the satellite in latitude between the values of + and - 15 degrees.

The numbers in the center of each printout represent the Sun Angle in degrees for each combination of Attitude Longitude and Latitude. The per centage illumination of the solar panels = 100*COS(Sun Angle) and AO-13 needs 70% or better solar panel illumination to maintain full transponder operations. In other words the Sun Angle must lie somewhere between + or - 45 degrees.

/EX
SB SAT @ AMSAT $ANS-158.04
AO-13 ATTITUDE PLANNING: PART II

HR AMSAT NEWS SERVICE BULLETIN 158.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.04
TO ALL RADIO AMATEURS BT

AO-13 Attitude Planning Explained by G3RUH & VK5AGR: PART II

The significance of the plus and minus signs and the blank areas is that for those values of attitude Latitude and Longitude the Sun angle is either less than -45 degrees or greater than +45 degrees; in other words, UNDESIRABLE.

I have chosen the dates of all the planned attitude changes for the remainder of 1992 to try and demonstrate why there is a need for the attitude changes.

1992 Jun 8 [Mon] SEL= -24.12 SAZ= 125.9 WP= 287.6 RAAN= 22.54 IN= 56.7

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90
-------------------------------------------------------------------------------
15 | --- -37 -28 -19 -10 -1 8 16 24 32 39 44 +++ +++ +++ +++ 43 37
10 | -44 -35 -26 -17 -8 1 10 19 27 35 42 +++ +++ +++ +++ +++ +++ 41
5 | -42 -33 -24 -15 -6 3 12 21 30 38 +++ +++ +++ +++ +++ 45
0 | -39 -31 -22 -13 -4 <5> 14 23 <32> 41 +++ +++ +++ +++
-5 | -37 -28 -20 -11 -2 7 17 26 35 43 +++ Sun here +++ +++
-10 | -34 -26 -17 -9 0 9 18 28 37 +++ +++ at 126/-24 +++
-15 | -31 -23 -15 -6 2 11 20 29 38 +++ +++ +++
-------------------------------------------------------------------------------
```

Looking at the printout for 8-Jun-92, if the attitude was to be left at Longitude 180 degrees and Latitude 0 degrees ("180/0"), which is the most desirable attitude for antenna pointing, you can see that the Sun Angle is 32 degrees which is very close to the undesirable area, whereas with an attitude of 210/0 the Sun angle is only 5 degrees, or 99.5% illumination.

/EX
SB SAT @ AMSAT $ANS-158.05
AO-13 ATTITUDE PLANNING: PART III

HR AMSAT NEWS SERVICE BULLETIN 158.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.05
TO ALL RADIO AMATEURS BT

AO-13 Attitude Planning Explained by G3RUH & VK5AGR: PART II

If you compare this with the next printout for 92-Jul-20 you can see that the "undesirable" area is right in the center of the printout, which will necessitate moving the attitude to the other side of this area via an attitude of 180/15.

1992 Jul 20 [Mon] SEL= -34.22 SAZ= 175.7 WP= 291.1 RAAN= 14.79 IN= 56.7

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90
-------------------------------------------------------------------------------
15 | -4 4 12 19 25 31 36 39 <41> 40 39 35 30 24 18 11 3 -5
10 | -1 7 15 22 29 35 40 44 +++ 45 43 40 34 28 21 14 6 -2
5 | 2 10 18 26 33 39 45 +++ +++ +++ +++ 44 38 32 25 17 9 1
0 | 5 13 21 29 36 <43>+++ +++ +++ +++ +++ +<> 42 35 28 20 12 4
-5 | 7 16 24 32 40 +++ +++ +++ +++ +++ +++ 39 31 23 15 6
-10 | 10 19 27 35 43 +++ +++ Sun here +++ +++ 42 34 26 17 9
-15 | 13 21 29 38 +++ +++ at 176/-34 +++ 45 37 28 20 12
-------------------------------------------------------------------------------
```

This means that while the reorientation is in progress, and even at 150/0 the Sun angle is still not anywhere optimum either for solar illumination or for antenna pointing. One option that was considered was to leave the attitude at 180/15 rather than continuing to 150/0 but from previous experience a latitude much greater than 5 degrees results in relatively poor antenna pointing angles, which makes communicationing harder. So generally controllers maintain the latitude as close to 0 degrees as possible and just adjust the longitude.

1992 Sep 21 [Mon] SEL= -2.093 SAZ= 241.3 WP= 296.5 RAAN= 1.353 IN= 56.97

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90
-------------------------------------------------------------------------------
15 | +++ +++ 36 27 17 8 -2 -11 -21 -31 -40 --- ---
10 | +++ +++ 38 28 18 8 -2 -12 -21 -31 -41 ---
5 | Sun here +++ +++ 38 28 18 8 -1 -11 -21 -31 -41 ---
0 | at 241/-2 +++ +++ 39 <29> 19 9 <-1>-11 -21 -31 -41 ---
-5 | +++ +++ 39 29 19 9 -1 -11 -21 -31 -41 ---
-10 | +++ +++ 38 29 19 9 -1 -11 -21 -30 -40 --- ---
-15 | +++ +++ 38 28 19 9 -1 -10 -20 -29 -39 --- ---
-------------------------------------------------------------------------------
```

By 21-Sep-92 controllers can once again afford to change the attitude back to the more desirable attitude (for the antennas) of 180/0 with a Sun Angle of 29 degrees. Also you can see that the undesirable area has drifted further to the left of the printout as the Sun moves around it own orbit.

1992 Nov 23 [Mon] SEL= 33.06 SAZ= 304.9 WP= 301.8 RAAN= 349.6 IN= 56.97

```
LA\LO| 260 250 240 230 220 210 200 190 180 170 160 150 140 130 120 110 100 90
-------------------------------------------------------------------------------
```

```
15 | +++ 37 29 21 12 4 -4 -12 -19 -25 -31 -36 -40 -42 -42 -40 -36 -32
10 | 43 35 26 18 10 1 -7 -15 -22 -29 -35 -41 -45 --- --- -45 -41 -36
5 | 40 32 24 15 7 -1 -10 -18 -25 -33 -39 -45 --- --- --- --- -45 -40
0 | 36 29 21 13 4 <-4>-12 -21<-29>-36 -43 --- --- --- --- --- --- -43
-5 | 33 26 18 10 2 -7 -15 -24 -32 -40 --- --- --- --- --- ---
-10 | 29 22 15 7 -1 -10 -18 -26 -35 -43 --- --- --- ---
-15 | 26 19 12 4 -4 -12 -20 -29 -37 -45 --- ---
-------------------------------------------------------------------------------
```

In the last printout which is for 23-Nov-92 the undesirable area is creeping in from the right, and will continue to drift from right to left. If the attitude was left unchanged at 180/0 the Sun Angle would soon be less than -45 degrees. So a move to 210/0 is planned for that date to restore the Sun Angle to -4 degrees.

I hope that the above tables and explanation has helped you understand why AO-13 Command Stations have continually to compromise antenna pointing to meet solar panel illumination requirements.

AO-13 OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 158.06 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.06
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and Mode J/L on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

20-Jun-92 2000 B 146 WA5ZIB WJ9F
5-Jul-92 0200 B 118 W9ODI N7NQM
11-Jul-92 2300 B 225 W5IU WA5ZIB

Guest commentators are planned. Join the net if you have questions. In the unlikely event that either the NCS or the alternate do not call on frequency, any participant is invited to act as net control.

****

Slow Scan Television on AO-13

Starting Sunday, 14 June 1992 the SSTV net will meet on a downlink frequency of 145.925 MHz, Mode B at MA 165, UTC Sundays. Also try Mode J, UTC Saturdays at MA 165, frequency of 435.980 MHz. Try the various AMSAT Nets for scheduling at other times.

SPRING AND SUMMER AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 158.07 FROM AMSAT HQ
SILVER SPRING, MD JUNE 6, 1992 BID:$ANS-158.07
TO ALL RADIO AMATEURS BT

AO-13 Early Summer Schedule Announced

The early summer schedule for AO-13 is as follows:

N QST 1992 May 08 AO-13 Transponder Schedule Jun 10 - Jul 20
Mode-B : MA 000 to MA 165 ! Mode-JL on Mon, Wed !
Mode-JL : MA 165 to MA 200 ! Fri and Sat UTC only. ! Alon/Alat
Mode-LS : MA 200 to MA 215 ! S Beacon on "L" days ! 210/0
Mode-B : MA 215 to MA 256 ! S Transp on "B" days +----------/
Omnis : MA 250 to MA 060 ! Mode L OFF after Jun 23 until
Aug 17. Next attitude change Jul 20, to 150/0 until Sep 21.
73 de Peter DB2OS, James G3RUH and Graham VK5AGR.

L QST de G3RUX. 92May08. AO-13 Calendar for remainder of year:
Date Event Modes Sun Angle SEL/SAZ

1992 Jun 08 [Mon] Move to 210/0 B JL S 5 -24/126
1992 Jun 29 [Mon] L OFF B -- - 24 -33/149
1992 Jul 20 [Mon] Move to 150/0 B -- - 43 to 47 -74/176
1992 Aug 17 [Mon] L ON B JL S 28 -26/208
1992 Sep 21 [Mon] Move to 180/0 B JL S -1 to 29 -2/241
1992 Nov 23 [Mon] Move to 210/0 B JL S -29 to -4 33/305
1992 Dec 14 [Mon] L OFF B -- - -27 33/333
1992 Dec 28 [Mon] t.b.a. 43 29/351

SEL/SAZ is Sun's position in orbit plane (like ALAT/ALON). Move
Jul 20 to 150/0 because Sun is at SAZ=176 i.e. apogee direction
and thereafter around SAZ=208 - 240. Interesting! 73 James

AO-10 is currently available for Mode B operation when it is view of your
QTH. PLEASE DO NOT attempt to use AO-10 if you hear the beacon or the
transponder signals FMing.

WB6LLO Copies This From G3RUH To DB2OS & VK5AGR Off AO-13 Telemetry Beacon

Attitude Change 180/0 -> 210/0.

I have done the preparation for this. The change is complicated by

(1) 25 minute eclipses from MA 246-000.
This robs us of 50% of the magnetorquing capability, so that the
maneuver takes 10 perigees rather than 5, and this will take an
elapsed time of about a week.
(2) Alternate day Mode-L is a nuisance, given that Mode-B commanding
is very difficult these days due to suspected radar interference.
(3) Sun's elevation is only 25 degrees, giving poor attitude estimation
in spacecraft attitude latitude.
(4) Sun's azimuth is 127 degrees and when the attitude is close to
210/0, ESWATCH Earth sensor trigger timing that gives us att.
longitude, will only work for the antenna sensor; the lower sensor
sees the terminator.

I will start the process on Jun 05 [Fri], orbit 3045 for 5 perigees.
This should get us to Alon/Alat 196/-4, 30 rpm and a Sun angle of 20
degrees. On Jun 08 [Mon] Orbit 3051 during Mode-L, I will attempt an
interim attitude estimation. I will then invoke Mode-JL every orbit for 2
days MA 140-175 until Jun 10 [Wed]. On the same orbit I'll invoke another
magnetorque session for 4 perigees. This should get us within 10 degrees of
the target by Wednesday. On Jun 10 [Wed] orbit 3056/150 on mode-L I will
try an attitude estimate again, and prepare a final magnetorque and spin-up
to 45 rpm. (It will have fallen to 15 rpm). The published 210/0 schedule
will also be invoked. Keep your fingers crossed! 73 James.

<<Thanks to Dave WB6LLO for relaying this bulletin>>

Prospective ARRL authors can obtain our "ARRL Author's Guide" by contacting our Technical Department Secretary. This mini-publication will explain our policies and guidelines. If you did not receive on of these in response to a query for a writer's guideline, someone here made a mistake that needs to be corrected. I will take care of it for you. Others can send email to bdicosim@arrl.org -- make sure you ask specifically for the ARRL Author's Guide and *include your street or POB address*!

I hope that this offer will shake out a few new authors. Some of the neat project ideas discussed in the thread and in private email to me would be nice for QST (or CQ or 73). To quite an extent, what goes into QST is dependant on what is received from the League outside of HQ. Let's see if all these good ideas can be turned into good reading and homebrewing fun.

> Mike Boschat

> John F. Kennedy Astronomy Observatory

You might look for my article in QST : "VHF meteor scatter - an astronomical perspective" June, 1986, p 14-20. Also look for some very interesting articles in QST this August (from Emil Pocock, W3EP), and in Sky & Telescope (from Joe Lynch, N6CL). Ham have been "observing" meteors with radio for decades. This August's Perseids ought to be especially nice because an outburst/storm is predi
cted.

Cross-posted to: rec.radio.amateur.misc,sci.electronics

I've trying to "remodel" an old 15-tube Bogen hi-fi stereo amplifier
into a small amateur radio transceiver just to show that it can be done,
but besides some educated guessing and deducing the pinouts, I can't
find the specifications of two of the tubes, probably because these
tubes are "newer" than are included in my old manuals:

* 6DW5 - power output; one pair is used in push-pull to drive each
output transformer

* EZ81/6CA4 - rectifier; would like current and voltage ratings

If someone has a tube manual that includes specifications (pinouts and
electrical) of these tubes, I'd sure appreciate a faxed (913) 532-7353
copy.

>Seriously, I just hate it when I hear something like 'Good idea, too bad
>it wasn't submitted in the proper form' AARRRGGGHHHHHH, Who needs it?
>No time for such tomfoolery!

I must apologize for not being clear. I did not mean to imply that the letter absolutely needed to be postal. I guess I just presume that email is mail. :-). Unfortunately, not all of our staff is connected to our internal network, and thus to the outside world.

We recently made some changes to our internal network, and to our external Internet connection (I am now ehare@arrl.org instead of the old convoluted address I used to have.) As soon as our new users have had a chance to become familiar with the internal LAN and its operation, we will post a new ARRL addresses list, complete with new users and our new addresses. (Those who saved a copy of our previous postings of ARRL HQ addresses can substiture @arrl.org for the old %arrlhq.UUCP@uhasun.hartford.edu -- that will direct email here directly.)

I consider email to be the same as a letter. I DO NOT put a posting
into the same category! I believe that to be the main thrust of my post.
In spite of my omission of email as a valid communications tool, the point
is still the same. Postings, (or on-the-air discussions) about ARRL policies
do not carry the same weight as direct communication.

So here is a slight modification to my original suggestion:

>>I want to point out, though, that this is a second-best approach. The
>>thoughts and desires of our members posted will have an impact on those
>>that read them here, but not nearly as much impact as a personally written
>>letter *or email* to ARRL HQ and/or your Division Director.

I will add that you should include your postal address in your letter. If your
incoming email needs to be routed to someone not on the ARRL LAN, he or she
will have to respond the slow way. :-).

Thanks for the clarification. I guess I am just getting too accustomed to
technology. :-), 73, Ed.

Our people in Washington, Gannett is doing the over the air tests for
the FCC, think that something similar to Advanced Compatible Television,
ACT, will be the Commission's ultimate choice. The problem with incompatible
systems is the installed base. There's over $100 billion in NTSC equipment
in use. If a incompatible system is chosen, broadcasters will require
twice the current spectrum during a long phase in period to avoid
prematurely obsoleting that installed base. That's as bad as the wide
bandwidth systems the Commission have already rejected.

That's a shame, because DATV has some real advantages over ACT, but
it's the current best bet that some form of ACT will be the winner.

3142. Heathkit PK-21 Info wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-08 13:11:55 UTC
From: turini@gdls.UUCP
Message-ID: <4213@gdls.UUCP>
Source record: 288898
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc

At a hamfest yesterday I picked up a Heathkit HK-21 Pocket Packet at
a good price. Unfortunately, it came with no instructions, accessories (?)
etc.

I called Heath and ordered a manual, but it will not be here for a week.

Some of the connections are self-explanatory, but others are not. Can
anyone give me a quick explanation of the connectors, how to set the
baud rate, etc. So that I can try to get it up before the manual gets
here? (I'm going on vacation at the end of the week, and it sure would
be nice to take it along with me, but I don't think that the manual will
make it here by then.)

BTW, I assume that there is an external charger for the ni-cad battery?

Thanks

Bill KA4GAV/8

This *used* to be a good approach. Unfortunately, current generation
BCB radios are *synthesised* on 10 kHz centers (US), or 9 kHz centers.
In addition, the RF frontends are lousy compared to older radios, 1960s
vintage. Just adding a BFO isn't that good an idea either. A product
detector is *much* better than a diode detector and a BFO. The problem
with them is keeping the strength ratio of signal to local oscillator
correct. People with old receivers using BFOs know that they have to
continously ride the RF gain control to keep the balance.

In the good(?) old days, I used a crystal controlled converter in
front of a Delco to receive 75 meter AM. That was really nice.
Unfortunately, that was then and this is now.

>Are there, in fact, ANY clean ATV transmitters on the market?
> - Brian

AEA is the best of a bad lot. Good VSB TV isn't easy. You really need
to put the VSB filter *after* the final amplifier to get a clean spectrum.
Otherwise the (non)linear amp puts back much that the filter takes away
in addition to adding wideband white noise.

Minimizing differential phase and gain are tough with current generation
equipment. Lot's of predistortion is required to make the signals halfway
watchable. Sync compression is a perennial problem, and the slightest
overmodulation causes products all over the band. Looking at the output
of these ATV stations with a spectrum analyser is very depressing.

FM ATV minimizes almost all these problems.

3146. New Lighting

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-08 14:22:04 UTC
From: harp@bnr.ca
Message-ID: <harp.43@bnr.ca>
Source record: 288913

A couple of years back I investigated the possible use of some DC lighting.
I found that there are flouresent lights that run off of DC available.
These are commonly used in RV applications. They convert DC to RF and
operate the same tube from RF. They are more efficient than the standard
ballast type. Some believe that the cost of electronics could someday
be low enough that these circuits could replace ballasts in AC applications.
They can radiate RF if not designed properly etc. They no longer blink
at 60HZ when they run from RF.

The thought of radiated RF discouraged me from considering them for my
RV. I don't use them.

>Seriously, I just hate it when I hear something like 'Good idea, too bad
>it wasn't submitted in the proper form' AARRRGGGHHHHHH, Who needs it?
>No time for such tomfoolery!

I think you misinterpreted Ed's remarks. The point here is that there
is a difference between email and news. That is, email from members

that is sent to ARRL HQ is no different from "regular" mail in that it *must* be answered by staff--that's the policy. That's different, though, from news discussions. By their nature, news discussions are running dialogues. When an ARRL staffer is reading the news and comes across something that (s)he thinks warrants ARRL action, naturally (s)he should see that such action is taken. But that doesn't always happen when you think it ought for various reasons. One of these reasons is that (s)he may simply not see the issue as something for ARRL to act on. Another cause is that when the same information flows past the screens of several people's computers, it's easy to assume that someone else will deal with a given issue. (After all, you can't have *everyone* responding to every article!) So things inevitably slip through the cracks. That's what makes email different: it lands in someone's mail box (ideally the correct one) and they have to deal with it. Frankly, I wish more folks here at HQ took advantage of the news here. Some do, but some feel that filtering out the useful stuff from the noise takes too much time. I don't happen to think so, but that's just my view.

Another point Ed made is important, too. ARRL *policy* is made by the Board of Directors, *not* the HQ staff. Opinions on policy matters, while welcome here at HQ, are most effectively addressed to your division director. Their addresses and phone numbers are on page 8 of each issue of QST. (To the best of my knowledge, none of the current directors have news accesss, although a couple can be contacted by email--see the list of addresses in the FAQ.)

The point is this: if the issue is important to you, *mail* it (email or paper) to the appropriate ARRL official or staff member. That way you can be fairly certain that it will be dealt with.

(Ahem...)

There's a new Amateur Extra Class operator on the net.

Some answers:
No, I'm keeping my old call. The current AA8H_ calls are simply
too hard to speak and the burden of changing the existing databases
and Personalized Junque is greater than I care to bear.

Yes, the written exam is MUCH easier than the written exam for the
Advanced and maybe as tough as the written exam for the General.

About a year and a half. I started studying for Novice about the
beginning of December, 1990.

The best advice I received was from Bob N8BYY who advised me to keep
at it while I was still interested.

I will now regain my normal composure....

I cast my vote with those who wish to see QRP articles on a regular basis. Homebrewing and QRP are what make amateur radio fun and accessible for me and others like me who love to tinker with electronics and who can't afford to buy a lot of equipment. I get a big kick out of listening to CW on 40 meters on a receiver I made myself, using an antenna I made myself, and powered with a power supply I made myself from parts scavenged from an old cassette deck. I am excited by the notion that with a handful of parts from my junkbox I can put together a simple transmitter that will allow me to communicate over hundreds of miles with under 5 watts of power.

Don't get me wrong--if I win that Icom TS-450S at the next hamfest, I'll take it home and use it, but I'll still be spending a lot of time scrounging for parts for my next QRP project.

In fact, I've just about finished collecting all the parts I need to build the Ugly Weekender transceiver, which, if it works (!) I intend to be running on Field Day from a peak in southern Colorado...

Yes and no. I'd put a bit more of the onus on ARRL. If you're
going to publish a magazine you should ensure that you solicit and
acquire publishable material. You can't just wait for stuff to come
in "over the transom." To an extent, that is what has happened
with QEX. But I think that can change. In fact, there is an
opportunity to change some aspects of QEX right now. I solicit any
suggestions anyone has for improvements to QEX. (Concrete suggestions
are more welcome than: "get more and better articles"--I already
know that!)

jon@Turing.ORG (Jon Gefaell (KD4CQY)) writes:

[But note that since Jon has struck a hot button here, he should not necessarily take the word "you" personally in the following.]

>It is the year 1992, anyone can easily send and receive worldwide email
>from their home with a simple microcomputer running even MSDOS.
> ...
>What do you think?

I think that it is an established fact that lots of people *do* *not* have a simple microcomputer or any other email outlet; so if *you* want to communicate with them, *you* will have to put an effort into it -- other than demanding that they go buy a computer to keep up with the Joneses.

I suspect that a lot of people would regard the intrusion of people expecting INSTANT ELECTRONIC GRATIFICATION[TM] after sending them mail with the same loathing and disgust they feel for telephone solicitors.

I have observed that a substantial fraction (no, not 1.0) of those who complain about this or that organization not having email available are essentially saying "my thots arr SO improtant that THEY oght to be putting out an effort to get them!" Too many "Information Junkies" quickly forget that communication is much more effective when the communicator puts some effort into it.

You want to be able to electronically dash off some half-baked thought with the greatest of ease? Don't be surprised if the recipient bit-buckets it with the same efficiency. BIFF can, after all, generate the same email you can -- but fortunately he seems to be confused by stamps :-).

(There's about a million groups this ought to be crossposted to, but I think I'll pass. Also, this topic is no longer about radio, and probably ought to find a new newsgroup to call home. Which one, I don't know.)

Amateur licenses are only issued one day a week (Thursdays?). Besides
you're only talking a little over a hundred licenses there. Since we
typically pass 45 or so technician licenses during our test session,
it would only take a couple of large sessions to arrive coincidentally
to jump the call signs up like that.

3161. Re: New Lighting

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-08 17:42:19 UTC
From: vbreault@rinhp750.gmr.com
Message-ID: <VBREAULT.92Jun8134219@rinhp750.gmr.com>
Source record: 288923

In article <harp.43@bnr.ca> harp@bnr.ca (Alan Harp) writes:

A couple of years back I investigated the possible use of some DC lighting.
I found that there are flouresent lights that run off of DC available.
These are commonly used in RV applications. They convert DC to RF and
operate the same tube from RF. They are more efficient than the standard
ballast type. Some believe that the cost of electronics could someday
be low enough that these circuits could replace ballasts in AC applications.
They can radiate RF if not designed properly etc. They no longer blink
at 60HZ when they run from RF.

The thought of radiated RF discouraged me from considering them for my
RV. I don't use them.

I wanted more light over the cooking area in my RV and got one of those
12V fluorescent lights to brighten it up. It got me all the additional
light I needed but is rich in RF noise. I continue to use the light
but not when I'm on the radio.

On the continuing subject of "LOOK FOR US IN THE JUNE VHF CONTEST":

W0UC/9
Grid: EN44
Bands: 50Mhz - 1296Mhz (excluding 902)

We are consistantly one of the top 6m stations in the contest, (we run 1500 watts to 2 sets of 4 x 4 element fixed arrays and and 8 element rotational antenna), but we'd like to up our totals on the other bands as well. We have a pretty good setup on the other bands as well, so please listen up in this direction.

In addition to us, there is alot of other activity planned for this area. There are to grid-peditions planned for EN45, the KA0VYB group in EN33, and there is always alot of activity around the Twin Cities (EN34 & EN35).

There's alot of activity here just waiting to be worked. See you in the contest.

> No time for such tomfoolery!
>
>
> What do you think?

Hi Jon,

I personally think Ed Hare has a point, and I'd like to give you some idea of why I think this way.

Suppose you were to get up in front of your local amateur radio club and do a presentation on how to build a simple Radio-Widget. You had had a few people in the club ask you to talk about such things in the past, and you felt that perhaps the new members (and perhaps some of the old-timers) might appreciate some new building techniques that you had perfected since you last talked about Radio-Widgets a year or two ago.

So now you've done the talk, and are wandering around talking to people after your presentation.

Fred KD4XYZ comes up to you, shakes your hand and says "marvelous talk, Jon, that new widgeting technique was just brilliant! You should talk about such things more often. Thanks a whole lot!"

You wander around some more. You wander past a clump of people off in a corner, and you hear your name mentioned, so you move closer. Just as you get within decent listening range, you overhear Ralph KD4XXX say to someone else in the group "Boy, I sure wish Jon would stop beating a dead horse. Didn't he talk about Radio-Widgets last year? I mean, Radio-Widgets are passe' -- nobody uses them anymore anyways."

Now, you were present for both comments, both positive and negative. The positive comment was delivered directly to you; the negative comment was discussed in a forum where you were present, but it was at no time taken directly to you.

Which would you take more seriously? Which would you be most likely to answer directly, the fellow who went to the trouble to hunt you down and say it to your face, or the fellow who was perfectly willing to discuss

it in a general forum, but couldn't be bothered taking the time to tell you directly?

Just my opinion,
Faith

Oh, and a P.S. for Ed Hare: Is it now possible for those of us in Net-land to submit letters to the QST editor electronically?

Well, just to throw in my .02 worth - I could care less for all
that extra garbage - I can't afford any of the radios that have it!
I just want to be able to get my signal out, and I suspect that implies
that I am, in fact, more interested in RF performance. In truth, my nifty
little Uniden HR2510, with not a lot of bells or whistles, has been able
to work around the world. It *isn't* high powered. It *isn't* fancy.
It *is* reliable.

Would I like to see a version of that radio with about 175 or 200
watts? You're darned right I would, because I might actually be able
to scrape enough money together to afford one.

Actually they seem to have replaced it with a newly stock-numbered cable,
also RG-8 with PL259 connectors, and also with an increased price. I found
a couple of boxes of the older stuff at the $10 price at a local Radio Shack
a few months ago, but not in two others.

Speaking of Coax, could someone be "coaxed" into posting a tutorial on it
for us novices?

>jon@Turing.ORG (Jon Gefaell (KD4CQY)) writes:
>
>[But note that since Jon has struck a hot button here, he should not
>necessarily take the word "you" personally in the following.]

I'll keep that in mind...

>>It is the year 1992, anyone can easily send and receive worldwide email
>>from their home with a simple microcomputer running even MSDOS.
>> ...
>>What do you think?

>I think that it is an established fact that lots of people *do* *not* have
>a simple microcomputer or any other email outlet; so if *you* want to
>communicate with them, *you* will have to put an effort into it -- other than
>demanding that they go buy a computer to keep up with the Joneses.

I'm not speaking of people without the means or need for such communications.
I'm speaking of a membership organization with dues and duties. I expect that
the money I pay, and the moneys paid by other members will be used to the
best purposes possible. IF there are several thousand ARRL members here in
the net, AND there are MANY employees of the ARRL reading these groups and
receiving mail, then they SHOULD HAVE NO REASON not to participate in this
medium.

Of course, the message I was responding to said that even though they could &
did forward printed copies of the suggestions and feedback received, only
those items sent via the Snail Mail could be seriously considered.

I'll be happy to donate the consulting to get a UUCP feed from a well connected
site, establish email and news programs and provide nominal training. But I
think this has already been done.

We're NOT talking about 'keeping up with the Joneses' here, we're talking
about efficiency in communications. Gosh, why even have telephones, eh?
I mean, just 'cause the Joneses have one? People can send mail, right?

Email is the major application of the '90s IMHO, and sticking your (the
editorial 'you', of course) head in the sand won't cause time to stop...

I hope it's not the same forces that held back the NoCode license that
are holding back movement into the current era of communcations, but I
suspect it's the same people, with the same fears and inadequacies.

>I suspect that a lot of people would regard the intrusion of people expecting
>INSTANT ELECTRONIC GRATIFICATION[TM] after sending them mail with the same

>loathing and disgust they feel for telephone solicitors.

Well, looks to *ME* like you've got a problem with technology, or with being communicated with, I'm not sure which. I do not loath and feel disgust with those who communicate with me. Now, if I get calls to buy a portrait, or insurance, I don't like those... I'm not trying to telephone solicit the ARRL, I'm communicating with the people who's salaries I pay, People who are in their jobs because people *I* had a part in voting for hired, or caused to be hired to fulfill the mission of the ARRL, a membership org-anization.

>I have observed that a substantial fraction (no, not 1.0) of those who complain
>about this or that organization not having email available are essentially
>saying "my thots arr SO improtant that THEY oght to be putting out an effort
>to get them!" Too many "Information Junkies" quickly forget that communication
>is much more effective when the communicator puts some effort into it.

I wonder why you thought it was necessary to be obnoxious here? Why did you feel the need to mispell your quote? Makes me think that instead of a valid point, you've got an ax to grind. Why else be insulting and rude?
Sure, I said I'd remember that you meant the editorial 'you' above, but this is really out of line. Perhaps this is YOUR idea of what I, or people who have 'thots'(sic) like mine are like? You do yourself a misservice sir.

>You want to be able to electronically dash off some half-baked thought with
>the greatest of ease? Don't be surprised if the recipient bit-buckets it with
>the same efficiency. BIFF can, after all, generate the same email you can --
>but fortunately he seems to be confused by stamps :-).

You seem to have a terrible prejudice against mail? Could it be that your experience has traumatized you so considerably? I participate in a number of newsgroups and mailing lists, and use mail constantly for work and con-sulting business as well.

Flames come and go, that's easily dealt with. I couldn't do my business(s) without email... *I* tend to give my postings/email some thought, as much as I do other coorespondence. The speed at which you can send off a message electronicaly CAN cause some less mature or less experienced people to go off the deep end, or poorly express themselves, but MOST people learn. And again, you can't ignore the medium, it's here to stay and growing by leaps and bounds.

Perhaps the only postings you've read, and the only email you've received have consisted of 'half baked' thoughts and mispeled wurds....

>(There's about a million groups this ought to be crossposted to, but I think
>I'll pass. Also, this topic is no longer about radio, and probably ought to
>find a new newsgroup to call home. Which one, I don't know.)

The topic IS, however, about communications, the ARRL and how they approach their responsibility to:

1.) coorespond with the membership
2.) promote and experiment with more efficient communications methods.

Of course, I said what I had to say in my original posting..

What do you think?

|>
|>Bob

You may not have used them as intended. Speaking for the ones I created:
those are Encapsulated PostScript (EPS) files. You can print them directly,
but that isn't really the intent. The normal use of any EPS file is to
be used by some desktop publishing program as "clipart". Such programs
will read the EPS file to determine the size of the picture, and will then
typically allow you to position it anywhere on the page, scale it as needed,
and so on.

Alternatively, you can do this "by hand". If you don't want the logo to
print by itself, delete the "showpage" at the end. Then put "translate"
and "scale" commands at the beginning to move and size the logo as needed.
It's a good idea to put a "gsave" before and a "grestore" after.

>Why "for ID"? Why else are you giving your call, except to identify?
>
>Why do people do this?

Giving a call does not always mean one is ID-ing. They may be calling
someone. Of course you giving your own call is not likely to be that,
but if you kerchunked and ID'd with nothing but the callsign at 3 PM
just to test your range to the machine, and later get a message from
a packet buddy that he heard someone calling or you on the voice repeater
at 3 PM.......

Another problem is when people want to announce they are listening to the
machine, too often they get just anyone answering, and at other times no
one.

There needs to be a way to distinguish between:

1. I am here, not to chat, but listening in case someone really wants to
specifically talk to me.

2. I am looking for a QSO for some (but won't say "CQ rag chew" on 2m
and above because VHF-ers don't seem to like HF-isms).

but that isn't really the intent. The normal use of any EPS file is to
be used by some desktop publishing program as "clipart". Such programs
will read the EPS file to determine the size of the picture, and will then
typically allow you to position it anywhere on the page, scale it as needed,
and so on.

Alternatively, you can do this "by hand". If you don't want the logo to
print by itself, delete the "showpage" at the end. Then put "translate"
and "scale" commands at the beginning to move and size the logo as needed.
It's a good idea to put a "gsave" before and a "grestore" after.

3177. Wanted: morse tutor software

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-08 19:53:55 UTC
From: graham@castle.ed.ac.uk
Message-ID: <22440@castle.ed.ac.uk>
Source record: 288942

Does anyone know of any good morse tutor software available (preferably as C source) for Sun workstations? I have seen some very good PC programs but do not have easy access to a PC (at least not such that I can have it bleeping all the time).

I have checked the net using 'archie' and all I have been able to find is a program that will translate text input into morse output by turning the bell on and off. Something a bit more sophisticated would be appreciated.

Alternatively I could use a morse tutor that runs on an Apricot PC (an IBM not quite compatible) - all of the IBM compatible programs that I have tried to run on it causes it to hang on any attempt to access the screen, external devices etc.

One thing that has amazed me since I got into ham radio a year ago is how over priced Ham Radio equipment is. From what I have seen anything HF is being sold at a premium. Bottom of the line HF transceivers that should be going for $500 max are being sold for $1000+. I have been building my own QRP rigs and have been really suprised how cheaply I can build my receivers and transmitters. I have priced building a 50 watt CW transceiver and I can build it for $100 max. This not buying parts in the massive quanities that Kenwood and the others do. I looked at building a 100 watt 20 meter SSB and I can do it for $175. So the light went on real quick that somebody is getting a great markup on their HF rigs. IF the market keeps growing the it looks like it is somebody is going to walk in and easily undercut the big guys. Come on $120 for 1200 baud TNC? HF verticals going for $300 made out of cheap aluminum? Windom beams going for $90? Sheesh, let's get real here. I think the only reason these guys get these prices is that people are used to over paying for average quality. I'm sure this is going to stir up things a bit. So let the flames beging! 8-)

Message-ID: <9206081822.AA01143@ap040.ti.com>
Source record: 288945

At the HAMCOM Convention in Arlington, Tx., this past weekend I purchased the Alinco DR599T, along with the DTMF and CTSS modules. I would welcome receiving any hints and kinks to go along with the radio. The rep told me about cutting the red and/or blue wires for extended receive and transmit, and mentioned the $18 + $3 s/h (ouch!) "pigtail" for 800 MHz receive. Rumor had it that the radio came with a casette tape, but the tape only comes with another radio (the 580?). The manual reads something like the fine print in a contract...

On a unrelated subject, the IC-u2SAT was missing from almost all the ICOM dealers' inventory. One dealer said that ICOM had discontinued the radio then re-introduced it.

Thanks!

3184. Wouff-Hong

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-08 22:37:39 UTC
From: tcarter@seismo.CSS.GOV
Message-ID: <50835@seismo.CSS.GOV>
Source record: 288951

While perusing a copy of the 1938 Radio Amateurs Hanbook (ARRL), I found these paragraphs at the end of chapter one, under the heading "Traditions":

As the League has come down through the years, certain traditions have become part of amateur radio.
"The Old Man" with his humorous stories on "rotten radio" was one of amateur radio's principle figures. Beginning in 1915 his pictures of radio and radio amateurs as revealed by stories in QST were characteristic and inimitable. There was much speculation in amateur circles concerning the identity of T.O.M., but in twenty years of writing he never once gave a clue to his real name or call. It was not until the untimely death of Hiram Percy Maxim, first president of the League, in 1936 that it was disclosed that he himself had been T.O.M.
The "Wouff-Hong" is amateurs radio's most sacred symbol and stands for the enforcement of law and order in amateur operation. It came into being originally in a story by T.O.M. For some time it was not known just what the Wouff-Hong looked like, but in 1919 The Old Man himself supplied the answer by sending in to League Headquarters the one and only original Wouff-Hong, shown here. It is now framed and hangs on the wall of the Secretary's office at A.R.R.L. Headquarters.

Does anyone out there know what the "Wouff-Hong" is and what the story The Old Man told about it was. I have asked around and can't find anyone with that kind of memory. None of the amateurs I talk to seem to know. Below is a crude reproduction of the photo in the Hanbook. The Wouff-Hong is made of two pieces of roughly hewn wood held together in the center by a metal band or collar. Size is difficult to jugde from the photo, but the pieces look to be roughly the size of small axe handles (or maybe hatchet handles.) The top of the left fork seems to be covered with a metal sleeve or cap.

Thanks...

I got together about 75% of the components needed for the most recent QST QRP Project (Yes, someone does read them) at a Surplus Electronic place in San Jose. The total cost minus 2 air variables some blank PC Material one transistor and a zener came to $3.83. All new high quality components. I've got to hunt for the remainder but I don't anticipate the total cost to be more than 20-30 dollars. Could it be that homebrewing will make a recovery?? By the way the surplus house was Ace Electronics on S. Bascom across from Quement. All sorts of components, nice quality arranged neatly and the sales clerk was even polite. He didn't even insist on having my Social Security number.

The complete story was in a January issue of QST, perhaps the 75th
anniversary issue, a couple of years ago. To summarize:

The Old Man (the pen name of Hiram P. Maxim), had been listening
to some rotten code and all he could make out of the jumble were
the letters wouff hong. He then wrote in his column about hearing
the jumble and wondered aloud what it could have meant. Some time
later, a reader mailed the "object" to QST explaining that
it was in fact a Wouff Hong and that its intended use was that
it was to be used upon those poor radio operatiors in an unimaginable
manner. It is said that one should consider the shape of the tool
and what _could_ be done with it.

Eventually, the Wouff Hong was framed and put on the wall at ARRL HQ
became legend in itself.

I wish that memory served just a little better . . . but it's something
along the lines of "the application of the Wouff-Hong is too horrible
to describe."

If you play your cards right, and are in the right place at the right
time, you just *may* be able to be initiated into the Order of the
Wouff-Hong someday. Or not.

3190. What size wire for 30A fusible link?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-09 03:11:17 UTC
From: dave@imax.imax.com
Message-ID: <1992Jun9.031117.24360@imax.imax.com>
Source record: 288958

I have a power inverter that uses a narrow circuit board track as a
fusible link. Due to temporary colour blindness (to put it charitably)
while connecting it to a car battery, the fusible circuit board track
went POOF. The circuit has a reverse-biased diode connected across
the input power connections, just downstream of the fusible link,
to ensure the link blows in case of reversed supply voltage. The circuit
is otherwise OK.

Now, in anticipation of this happening, the manufacturer allowed space
for a fuseholder to be soldered to the circuit board in place of the vanished
board trace. Unfortunately, I can't find a fuseholder of the correct size,
and don't want to send the thing back to the manufacturer. The board is
marked "F1 30A", so I figure all I need to do is solder in a suitable piece
of copper wire to act as a new fusible link.

Can anyone tell me what size of wire is needed to act as a roughly 30 A
fuse? Its value isn't that critical - the circuit is supposed to have
internal current limiting, so the fusible link is probably intended to
blow only during reverse-polarity or internal short-circuit.
A guideline in the form of "so many circular mils per amp" would
be fine too. I don't have a constant-current power supply of sufficient
capacity around to determine melting points of wire of various gauges
by trial and error.

Send me mail, and I'll summarize the answers.

That was just the bottom corner of the iceberg. A Collins 75A4 cost about $695 and a KWS1 cost $2,095. So for about $2,800, you could have the state-of-the-art rig in the late 50's. I believe my parents sold our house in southwestern Virginia that year for about $4,000. Wow--we could have turned that into a Collins rig and put it in a tent!

I built a three tube phono amp into a MW transmitter when I was
in high school. It had 1/4 mile range on 590 kHz, to the
nearest FCC monitoring station when retuned to 1620 kHz.

I also built car radios into a pair of 6 meter transceivers a
few years later. Plate modulated oscillator on transmit,
superregen receiver.

Back in the 60's radio hacking did not require Radio Shack
as long as your neighbors had old radios in their attics.

So what is the problem with having a long phase in period? In the UK, it took
(literally) over 20 years to completely phase out the old 405-line system,
and totally phase in the current 625-line system. Incidentally, that's why
UK amateurs have only recently obtained access to 6m - we had to wait for the
last Band II (50-something MHz) 405-line tv station to be taken out of service.

Oh, I forgot, I'm not in the UK anymore (;-))...

> [History deleted -- very interesting reading.]

I saw one at the EAA museum at Lakeland Florida. There were quite a few of these type of aircraft built. I'm not entirely sure, but this kit may have given the name to an entire class of light aircraft: Parasol-type. (The Pietenpol Aircamper is another example from the same era)

There are Parasol type aircraft still being built today.

The true irony of the Heath demise is that kitplanes today are a growth industry. With few manufacturers of light aircraft, many would-be airplane owners are choosing to build their own.

The ARRL Lab wants to test these devices for emissions and susceptibility just as soon as we can get our hands on one of them. They are (to be) made by:

Intersource Technologies
130 Kifer Court
Sunnyvale CA 94086
(408) 732-6760

As reported by a previous poster, the contact person there is Tom Moore.

I was told that engineering samples are not available, and will not be available for six months. (If any west coast folks have an "in", I would love to speed that timetable up a bit. :-)).

Mr. Moore sent me a few pages of technical information, although it appears to be more of a marketing blurb than anything else. The reports that the device operates on 13.58 MHz, crystal controlled, are accurate. The sheet specifies that the device meets FCC Part 15 and Part 18 requirements.

From the "Technology and Specifications" package supplied by Intersource Technologies:

"... (the device) is best described as an RF excited electrodeless fluorescent light source. ...

"The electronics package ... consists of a high efficiency power supply, 13.56 MHz crystal controlled oscillator, and RF power amplifier, and the coupling antenna. ... The basic light source requires only one IC and six transistors. ...

"The basic method used for generating light is the coupling of high frequency electrical energy into a mercury vapor plasma. The plasma becomes a conductive ring, located inside of the glass assembly, which acts like

the secondary of an air coupled transformer. ... Since the plasma contains
mercury, invisible light is created inside the glass assembly.
This is then converted to visible light by the phosphor coating."

This is all the info we have. If anyone learns anything else, please send
it along to me here at ARRL HQ. I have a file specifically set up for this
product (so far rather thin. :-)). We will keep our membership posted
through all the means available to us.

Thanks to all for their postings and help, 73, Ed.

3200. Radio Prices

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-09 12:25:15 UTC
From: cfishman@pica.army.mil
Message-ID: <9206090825.aa27971@FSAC1.PICA.ARMY.MIL>
Source record: 288966

Many on the net are complaining of the high cost
of modern HF radios being sold today. If they were
to look at QST for 1960 to 1970 they would see separate
transmitters and receivers selling for about $500.00
each....a Collins 75S3 receiver sold for about $900.00.
Todays radios are a good value for the buck...I whish
the receivers were stronger...especially in the fron end...
but don't bitch .....because $500 in 1960 was a hell of
a lot a bucks.....

WHAT'S YOUR OPINION???

Clark Fishman WA2UNN cfishman@pica.army.mil

PS: Parts price equal about 20% of the selling price

>you directly?

Remember also that the negative comments were only heard accidentally, just
like a post. I have missed news feed, missed posts, or been just too busy
to read all of the posts every single day. If you care about an issue,
send your concerns directly to us. Don't rely on ARRL, HQ or those in
the Field, overhearing a conversation in the corner of the room!

>Oh, and a P.S. for Ed Hare: Is it now possible for those of us in Net-land
>to submit letters to the QST editor electronically?

Faith. Thanks. Your example sure did a better job than my ranting and
raving. :-).

Yes, you can always submit letters to the QST editor electronically. We
have done a recent post of our ARRL HQ addresses (I actually missed it!).
I am sending you a private copy. It should be part of the FAQs now, and
I THINK is is also available by ftp from Buffalo. If anyone missed it,
and can't find it, send me email. I will email back a private copy. If
you have the one that routs us through uhasun.hartford.edu, you have
an old one. Our new one has our address as arrl.org. As Jon Bloom
recently pointed out in a follow-up post, our business policy
is that incoming email is to be treated the same as an incoming USPO
letter.

I want to thank those who raised the issue of QRP in QST, and those who sent me email and posted comments. All of the email and most of the posted comments are going to be bundled together and send to the QST decision makers. (My cutoff time for this is Friday this week, so if you want to make your voice heard about QST content, send it directly to me: ehare@arrl.org .) Keep up the comments - they mean more to us than some people think. :-), 73, Ed.

>it was to be used upon those poor radio operatiors in an unimaginable
>manner. It is said that one should consider the shape of the tool
>and what _could_ be done with it.

>Eventually, the Wouff Hong was framed and put on the wall at ARRL HQ
>became legend in itself.

The Wouff Hong can be seen here at ARRL HQ. You do not have to be a
member to get a tour of ARRL HQ (although we may encourage you do
sign up before you leave. :-)). Among other things, you can see
the dreaded Wouff Hong, now framed and kept in a glass case along with
some other similar objects of dread.

I must admit, however, that the exact method of its use has become
lost to us. Most of our vistors offer an idea or two ... cracking
the knuckles between the two pieces of wood, and a few other suggestions
(some more colorful than others).

Well, I am a member of the ROWH (Royal Order of the Wouff Hong).
As with most fraternal organizations, amateur radio has its own
"secret" society, the ROWH. Any radio amateur can become a
member after a dreadful initiation ceremony which by tradition
occurs just past midnight at an ARRL division or national
convention near you. Usually one of the local clubs which helps
to organize an ARRL convention is tasked with the tasteless duty
of performing the midnight ritual of inducting a new crop of
amateurs into the ROWH. Those of us who have survived these rites
are sworn to secrecy as to the content and procedures used to
induct us into this most sacred Order. And this is as it should
be. I suggest that at the next opportunity, when you attend an
ARRL convention, sign up for the midnight ROWH initiation ceremony.
It is an experience which you will not soon forget. Good luck.

John Shalamskas replies:
You probably saw an example of a ducting between the ocean
and the temperature inversion that accompanies certain weather fronts
(the exact description escapes me, ask your local weatherman!)
Usually the duct is near the Earth's surface in California, gradually
rising as you go West. KH6HME has his beacons and shack at the 8000 foot
level on Mauna Loa.

Paul (KH6HME) worked the mainland US on 5 Gigs last year.
Now THAT was a strong temperature inversion!

Aloha!

3209. Help: Johnson 7171 UHF moble radio

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-09 14:09:01 UTC
From: bcoleman@hayes.com
Message-ID: <5624.2a34bb7d@hayes.com>
Source record: 288854

I've got a Johnson 7171 UHF moble radio that I've successfully modified for amatuer operation.

It receives fine, and transmitting results in a good 10 w carrier.

Unfortunately, the transmit audio is distorted and almost unreadable. I've tried adjusting the deviation and balance, but it doesn't change the distorted audio. The audio sounds like it is running through an amplification stage with too much gain, but there's no microphone gain adjustment.

Any suggestions? Could it just be a bad Johnson mic?

Check out the European Stuff. We only have 432 to 440 to play with so all
FSTV on 70cms is VSB. Also if there is a USA run on these transmitters we
can get them out of the satellite band where they are a great nusance.

I think what Bob was saying, and I agree, is that the $1,000 rig would still cost $999 if *all* the bells and whistles were left off. They just throw them in so you can justify the expense to yourself.

Radios *are* cheaper today than ever before, but thanks to inflation, sticker shock is a reality. Consider that I paid $895 for a B&W 6100 in 1964. That was hot stuff in 1964, it was the first fully frequency synthesized ham SSB transmitter. All tube, it wouldn't fit in the trunk of most of today's compact cars. A fully loaded 64 Chevy cost $2695.

Today I can stroll into HRO and walk out with an IC735 tucked under my arm for $899. A 1992 Caprice Classic costs $27,000. Cars, and everything else non-electronic, have increased in price tenfold, but a *better* radio, including a general coverage receiver, only costs $4 more than a boat anchor transmitter did 28 years ago.

Yeah, but QST was getting some pretty bogus articles for a while right before they started paying for articles. Uncle Wayne was already paying and 73 was at the time generally recognized as being more technically inclined (could have had something to do with Wayne also putting out a computer rag so there was more cross-fertilization). There has been a definite increase in QST quality, even if you don't care for the subject mix.

An example of some of the bogus articles were:

A touch tone decoder that used 24 565 PLL chips (even back then there were TT decode chips on the market, and even if you were going to build it out of discrete PLL's most people could have gotten the job done with 7).

An article on microprocessor applications that made a clock for the blind that encoded the digits as one dot for 1, two dots for two, ... Jeez, this was before no-code and still they couldn't think of a better encoding (Morse?).

A repeater ID'er that used a motor, contacts, and a PC board that had the morse ID etched into it radially that spun on the motor. Admittedly this was a "Hint & Kink", but really, I had to check to see if this was the April issue when I saw that. Oddly enough, the ARRL chose to include that in their Hints & Kinks anthology.

Radios are sort of like CamCorders. If you've noticed over the past ten years or so, CamCorders haven't gotten much cheaper. They've gotten smaller, lighter, fancier, but still about the same price.

It will probably take another technology jump (which may happen seeing some of the new RF IC's coming on the market now) or just a realization that they've run out of improvements to justify the price once every radio has dual receive, DSP, super microprocessor, controlled bandstacking, built-in TNC/RTTY demod, automatic contest logging, voice keyer, ...

I think that's a good point. As a teenage ham in the 50's, even a Hallicrafters general coverage receiver was over $100 and that would have taken me many weeks of saving at $1/hour minimum wage of a part time job.

Today, for $200-$300 you can get some great new equipment (2m HTs, etc.) Yes, there is still costs involved, but I think the ability to pay is far broader today than 20-30 years ago. And, there's a lot of excellent used equipment available from folks at hamfests, etc.

I've just bought a Kenwood 732 (European version) and am generally very pleased with it. I have a few questions though:

* Why does the US/Canada version have separate aerial sockets ? I'll probably modify mine to separate the combined VHF/UHF connection.

* What are the frequency coverages/repeater shifts/steps sizes/etc for the 16 possible combinations of R19-R22 ?

* What's the difference between individual and group paging - they appear to be the same thing ?

* Are there any undocumented features I should know about ?
(In particular, is there a 'clone' mode ?)

* Are there any modifications I should know about ?

Also, I've had a couple of problems:

* DTSS doesn't appear to work. If I do a complete reset of the rig then it works for a while but I suspect that something else is interacting with its operation

* Remote DTMF control seems flakey. It can take several attempts to get it working.

I think the above two problems may be down to firmware bugs.

I do not think that the QST magazine has a monopoly on occasionally
publishing bad articles. Even the best research journals will occasionally
goof and publish a dud. Many of you on the net are in education
and know that this occurs despite rigorous peer review.

I am not that familiar with the QST editorial process but I assume that
only the ARRL staff provide the input to the accept/reject process.
It might be beneficial to extend it a select group of Amateurs who
might be in a position to provide more input. That is what the
editorial board of most research journals do. They solicit input
from reviewers who have previously exhibited talent/knowledge in the
area of the submission. This reduces the probability of having a dud.

By the way, this does not imply that all articles have to be about the
state of the art. There is no harm in ensuring that even educational
articles are correct. :)

As QST's technical feedback section makes clear, they do get good remarks
on not so good articles that they some times publish.
May be these remarks should be solicited *before* the articles are published.

You're just suffering from sticker shock. Check out ham rig prices from
30 years ago. I have an Allied Electronics catalog from 1964; a Drake TR-3
cost $300 plus accessories, and Hallicrafters and Johnson gear was lots
more
expensive than that. Figuring inflation, that $300 TR-3 cost over $1200
in 1992 dollars; about what small rigs cost now. The difference is that
the new rigs are light-years more capable, at least in terms of features.
Don't know about RF performance, but that's another thread. Ham rigs
today cost about what they always cost; it's just that the Feds have
watered down our money so much that it takes a lot more dollars to
buy one.

At least, that's my 8 cents worth (used to be 2 cents, but inflation, you
know...)

3220. Re: Radio Prices

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-09 15:40:42 UTC
From: furr@pilot.njin.net
Message-ID: <Jun.9.11.40.42.1992.500@pilot.njin.net>
Source record: 288832

Back in Dec-Jan I did a little research on priices of new and used
gear. My results (comparing used gear with original prices new was
that:
1. Advertised used HF rigs are overpriced given the technology
gap between them and the new rigs, and their new prices adjusted for
inflation;

2. Low-end new rigs are a good value, going for prices much
lower, after inflation, than years ago.

A good friend has prepared an article which he will submit to
some ham mag in which he has the data to show that today's low-end
rigs are cheaper than years ago, but the high-end, "bells and whistles
rigs are much more expensive.

I ended up with a TS 140s for $770 (shipping included), and am
entirely satisfied that I did the best I could do.

>opportunity to change some aspects of QEX right now. I solicit any
>suggestions anyone has for improvements to QEX. (Concrete suggestions
>are more welcome than: "get more and better articles"--I already
>*know* that!)

Yeah, it's all the *editor's* fault. Now let me see, who is that
guy.....Paul Rinaldo... nah he never writes anything. Must be that
guy Jon Bloom who does the editorials. :-)

The statement of purpose in the front of the mag says,

1) provide a medium of exchange of ideas and information between
Amateur Radio experimenters
2) document advanced technical work in the Amateur Radio field
3) support efforts to advance the state of the Amateur Radio art.

To improve 1, the editor is going to have to beg, plead, and arm
twist experimenters to use the Correspondence section for short
Usenet style sharing of ideas. I think once it gets lively, participation
will increase. Here is a good place to plug Usenet and Email submissions.

2 has defaulted to _Communications Quarterly_ as the heir to the late
lamented _Ham Radio_. They do a good job, but they only publish 4 times
a year. Perhaps QEX could take a page from Dr. Dobbs and do annual themes
so that each month features a special topic. For example, the January
issue could be the annual SS issue, May could be the weak signal boys
turn, August could be DSP, December ATV, etc. These would be the *featured*
articles, but not necessarily *all* the articles in an issue.

3 is the real key to success. The magazine must be seen as a resource
by the experimenter community. This is where columns are very valuable.
Quarterly Devices is the *best* thing about the competition's magazine.
It tips off those of us out in the boonies about neat new devices that
we can employ in our designs. The Components column is a good start,
but it's often too vague and too general. It should highlight devices
of interest to amateurs with enough technical detail to make it worthwhile
for the experimenter to follow up on them. Contact numbers should always
be given, and specific app notes should be referenced where applicable.
See Quarterly Devices' treatment of the MC2833 and MC13135 for an example.

The VHF+ Technology column is usually so tightly focused on the tiny
weak signal DX community's needs that I often skip it on first reading.
That's too bad, because it often features interesting new devices.
Most of the activity at VHF+ is *not* weak signal DX so the column
name is misleading at best.

Gateway is the best and worst part of QEX. It's the best because it
has news items and contributions from active packeteers. It's the
worst because it has no focus. It just rambles on, like me. :-(

Strengthen the columns, encourage quick snapshots of works in progress
in the Correspondence section, and consider theme issues. If that
doesn't work, publish a centerfold from alt.sex.pictures. :-)

Source record: 288831

In article <Jun.9.10.47.03.1992.24335@pilot.njin.net> ron@pilot.njin.net (Ron) writes:

Radios are sort of like CamCorders. If you've noticed over the past
ten years or so, CamCorders haven't gotten much cheaper. They've
gotten smaller, lighter, fancier, but still about the same price.

Way, way, way back. Back when color televisions were new, you could
pick one up for ~$350. That got you your basic RCA chassis television
in whatever cabinet the manufacturer sold. They were awfully primitive
by todays standards. Remote control consisted of a mechanical ultrasonic
controller that could be used to turn the mechanical tuner or switch the
set off/on. UHF, on screen display, MTS decode, electronic tuning and
a host of internal improvements were simply not available.

As the years passed, the quality improved somewhat, but the human factors
improved immensely. Todays televisions require NO tuning, NO tweaking
and NO periodic convergence. You can turn it on from your chair, watch
a clear sharp picture in just a few seconds, make any adjustments
(granted, few are necessary) via a smart controller and enjoy high
fidelity stereo sound while watching your picture-in-a-picture.

...and the prices are still right around $350

I get the feeling that as the manufacturers amortise the development
costs for one option they have to add another option to justify keeping
the price up and thereby their profits. Probably isn't a bad way to
run a business. It sure makes for better color televisions....

Another reason for the constant price point of electronics is simply a matter of profit margins. The overhead associated with building a $100 radio is similar to the overhead for a heavily whistled out $300 radio. The plant, assembly equipment, salaries, and everything else remains constant so there is a price point at which a manufacturer can not drop below and make a reasonable profit.

3226. Re: Radio Prices

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-09 16:53:44 UTC
From: aviator@athena.mit.edu
Message-ID: <1992Jun9.165344.27348@athena.mit.edu>
Source record: 288839

Any comparison of previous radio prices with current ones has to take inflation into account. A 1965 dollar just isn't the same as a 1992 dollar. Prices should either be adjusted (i.e. quoted in terms of real dollars), or converted into an equivalent unit (e.g. hour of labor). My father, an economist, recommends using the price of a Big Mac as an international standard. :)

The fallacy of comparing current prices from different time periods is a common problem and can generate very misleading results.

As a guide, here are some consumer price index (CPI) figures for the United States, courtesy of the International Monetary Fund's International Financial Statistics Yearbook:

Year CPI (1985=100)

1961 27.80
1966 30.18
1971 37.62
1976 52.90
1981 84.48
1986 101.86
1990 121.43 [don't have 1991 handy]

So, here's a conversion chart for $1,000 "then dollars" to 1990 dollars:

1961 $4,368
1966 $4,024
1971 $3,228
1976 $2,295
1981 $1,438
1986 $1,192
1990 $1,000

CPI may not be the best measure when talking about radio prices, but I believe real radio prices have decreased with time.

3227. Re: What size wire for 30A fusible link?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-09 17:29:08 UTC
From: bruno@hpldsla.sid.hp.com
Message-ID: <22360065@hpldsla.sid.hp.com>
Source record: 288805

/ hpldsla:rec.radio.amateur.misc / dave@imax.imax.com (Dave Martindale) / 8:11 pm Jun 8, 1992 /
I have a power inverter that uses a narrow circuit board track as a
fusible link. Due to temporary colour blindness (to put it charitably)
while connecting it to a car battery, the fusible circuit board track
went POOF. The circuit has a reverse-biased diode connected across
the input power connections, just downstream of the fusible link,
to ensure the link blows in case of reversed supply voltage. The circuit
is otherwise OK.

Now, in anticipation of this happening, the manufacturer allowed space
for a fuseholder to be soldered to the circuit board in place of the vanished
board trace. Unfortunately, I can't find a fuseholder of the correct size,
and don't want to send the thing back to the manufacturer. The board is
marked "F1 30A", so I figure all I need to do is solder in a suitable piece
of copper wire to act as a new fusible link.

Can anyone tell me what size of wire is needed to act as a roughly 30 A
fuse? Its value isn't that critical - the circuit is supposed to have
internal current limiting, so the fusible link is probably intended to
blow only during reverse-polarity or internal short-circuit.
A guideline in the form of "so many circular mils per amp" would
be fine too. I don't have a constant-current power supply of sufficient
capacity around to determine melting points of wire of various gauges
by trial and error.

Send me mail, and I'll summarize the answers.

Dave Martindale, dave@imax.com

>WHAT'S YOUR OPINION???

That the above is so much fluff. We could go on and on how radios were so expensive back in the golden days of ham radio. However this is now and the fact is most ham radio gear is way over priced. TNC's with $15 worth of parts going for $120? Give me a break. Trouble is that the manufactors have a good scam going and people defending them is a good example of mass hypnosis. Why we've always paid those prices and glad to do it! When I watch the prices of other electronic consumer items dropping and see that the prices of HF gear and as a matter of fact anything else in ham radio staying the same. I know that somebody is not going to the poor house. Radio Shack sells a Icom produced handheld for a lot less then a comparable ICOM HT. Hmmm, kind of a pattern here. There's not much competition in Ham Radio gear and the prices show it. Alinco is getting really popular because their prices are close to being reasonable. The major producers of ham radio gear are sitting duck when someone in Korea or Taiwan goes, hmmm, there is a market here that I could clean up on with low priced good quality gear. Though I'd hate to read their manuals. 8-) What the market needs is a 100 watt HF rig with split VFO's for $400. YOu'll never see it form the big boys but someone will notice and will sell it. Kinda suprised that Alinco hasn't waltzed in and done this yet.

73!

I have looked back in the old mags and noted that the prices have stayed pretty constant over the years. A similar phenomenon has occured in computer prices: the cost of a typical "nice" machine has been in the $2,000-4000 range for years, while the performance of the same has increased by 2 orders of magnitude, more in some respects. The difference is that you can still get a Turbo XT - dirt cheap. I would like to see the same thing happen in radios. Dirt cheap for minimal features and performance that is adequate for some purposes to get people into the market and plenty of neat stuff when they can afford it and are ready for the investment.

During last weekend I did some experiments with my IC-W2e and NiH battary
cells. For reference: these cells, available in regular AA size, have
double the capacity normal NiCd cells have (1000 vs 500 mAH).
The charge current also is double the value (100mA 14 hours instead of 50mA).
I use these cells in the BP90 which can hold 6 AA cells.

The only problem left is charging: the BP90 instructs the charging circuitry
to supply 50mA, so the time would double (28 hours).
I discovered that when the top sticker of the BP90 is peeled off, one finds
a resistor and a diode in series between '-' and 'E'. (resistor 6.8 ohms,
small silicium diode, cathode to E. Diode for temperature sense?)
This circuit codes the charge current required, it seems.

I tried decreasing the resistor but found that even if I short it,
I will only get 80mA or so. That is weird: while the European version
of this handheld is delivered with a 600mAH pack, the USA version
comes with a 1000mAH pack. I cannot imagine that the charging circuit
cannot deliver at least 100 mA if so instructed.

On the other hand, in the schematics there is a circuit that would limit
around 100mA, built by R1 and R9, on the PRT unit.

Would somebody who has the American version please turn off it's rig,
and measure how much the rig draws without pack attached (here 12 mA),
and with 1000 mAH pack attached?

BTW, for all who have the European version, try another antenna instead of the
dummyload FA-1443BB that comes with the rig. I don't know what it is made
off, but it's better called 'rubber dummy' instead of 'rubber ducky'.
Another antenna makes LOTS of difference! Try it..

Curious,
73 Geert Jan PE1HZG

3236. Cellular repeater antenna vs wired - how different?

Newsgroup: rec.radio.amateur.misc

Gary, KE4VZ writes regarding QEX:

>The VHF+ Technology column is usually so tightly focused on the tiny
>weak signal DX community's needs that I often skip it on first reading.
>That's too bad, because it often features interesting new devices.
>Most of the activity at VHF+ is *not* weak signal DX so the column
>name is misleading at best.

Personally, the VHF+ column is the only QEX column I read anymore. I guess that is probably because I'm a weak signal VHF enthusiest. There are very few good columns devoted strictly to weak signal work anymore so I would hope that this column does not get altered.

I really miss the microwave column that Bill Olson, W3HQT from Down East Microwave used to write for QEX. I presume Bill didn't have time to write it anymore, so that is why it disappeared. Too bad, because the microwave spectrum does not get enough coverage.

While the weak signal vhf community might be small, it is one of the most active group of experimenters and builders that there is, particularly at vhf and above. Granted, the packeteers may be changing that, but there are enough packet oriented columns out there that can handle the need for vhf packet articles. This is not intended as a knock on packet, it's just that if the weak signal columns get "cluttered" with other modes, they will end up being forgotten altogether and that would be very unfortunate.

I agree that the majority of activity on VHF (at least 1296 and below) is not of the weak signal variety, but this facet of the hobby is extremely exciting. Anyone who hasen't tried it doesn't know what they are missing.

3238. Blown transistors....

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-09 21:46:08 UTC
From: delusion@casbah.acns.nwu.edu
Message-ID: <1992Jun9.214608.19493@news.acns.nwu.edu>
Source record: 288852

Hello, all. I have an interesting, but small, electronics problem. I have an unusual little 3-band CW QRP XCVR rig that runs about 3-5 Watts...when it works. When I bought it for $5, the transmitter section was "busted", but the reciever worked wonderfully. I found that the problem was a blown transistor...I think it was the final since when I replaced it, the package said "power RF transistor". Anyhow, after I replaced the transistor, it worked A-OKAY, and packed quite a punch.....however not more than a day later, the transmitter again was broken....the transistor was broken again. I found that there must be some quirk in the rig such that excess voltage is getting to the final transistor and frying it. How can I prevent that excess voltage from harming the transistor? I read something about Zener diodes, but I can't get one for the voltage specifie (something like 36V).

Specs: I am running a Ten-Tec PM-1 into long wires. The long wire antenna has NO antenna tuner, but it is cut to approximately the correct length.

Despite the antenna, is there a way to protect the final from blowing. Or, is the problem something else?

Thanx in advance to all!

Two comments:

1. A TNC might contain $15 of chips but there are many other costs. Start adding up all the little costs for switches, connectors, crystals, tantalum capacitors, and a cabinet. Double sided PC boards with plated thru holes, solder mask, and parts locations silk-screened are not cheap. Add a manual, a box, and pay someone to assemble & test it.

Advertising, some profit for the retailer, someone to answer the telephone, rent, electricity, ... There's not much profit margin in there.

A product such as a TNC requires a tremendous development effort. If you're designing a consumer electronics item, the development costs can be spread out across millions of units. With most ham radio related devices (except transceivers) the numbers are probably in the thousands.

I've just been through this exercise. I developed a useful (IMHO) gadget in my spare time (development salaries = $0), planning to write a magazine article (= free advertizing), and sell kits. Guess what? That $xxx of chips has to be multiplied by about 10 to have any hope of breaking even with moderate sales.

2. We have a free enterprize system. You or anyone else is free to develop and sell a product with better features, performance, and/or price. If there is a big enough profit margin and enough potential

---
market to justify the start-up costs, someone will jump in.

>synthesized ham SSB transmitter. All tube, it wouldn't fit in the trunk
>of most of today's compact cars. A fully loaded 64 Chevy cost $2695.

(and other stuff deleted) OK, I'll grant you that. But
$895 is still $895 bucks, and in the midst of car payments, rent, medical
bills, and all the other assorted stuff, it is more than I can justify
laying out for a hobby. In 1964, (at age 6) I hadn't even HEARD of
Amateur Radio.... :-)

Actually, if I could see a radio of around 120 to 175 watts,
nothing terribly fancy - maybe a split frequency capability that would
allow me to work those folks who just insist on working 5 kc splits
on ten meters - no memories, etc. etc., for around $695, that 200 buck
difference would get me into the realm of possibilities....

> ARRL addresses list, complete with new users and our new addresses.

This is a good move. (Dare I say it's the most progressive thing I've seen the ARRL do in the last 10 years? :-)

I would also like to make the following requests of the QST editor:

1) In the QST sidebar listing the ARRL staff, include their e-mail address.
2) In the same sidebar, include the e-mail addresses for generic info requests as well as "departmental" e-mail contact addresses (i.e. the DXCC desk, letters to the editor, etc.).
3) In the masthead for each article and column, include the authors e-mail address (if they have one). Magazines like Sun Expert use this to good advantage.

Publication of these addresses will help more than just the "directly connected" internet community. Many IP packet users can e-mail to the Internet via various gateways. These same users tend not to have access to Usenet over the air, so they won't see your directory posting unless someone manually gateways it to the radio LAN. It also benefits Compu$erve users who don't have access to Usenet although they do have e-mail access to the Internet.

(Ed, send me the e-mail address of the QST Editor and I'll directly forward a copy of this request as well.)

Build or get a transmatch and use it! Even a 2:1 mismatch can subject the transistor to twice the voltage or current it normally sees, and if you can get within 2:1 by "cutting [a long wire] to the correct length" you'd be better spending your time at the track. Unless the transistor is extremely conservatively rated, it's almost certain to be killed. And I seriously doubt the design is that conservatively done. (HT's will handle about any mismatch -- but they get around 30% efficiency, or less, too.) Some simple transmatches are described in Solid State Design For The Radio Amateur, the ARRL Handbook, the ARRL Antenna Book, and others.

That being said, a zener really can help the rig survive the occasional bumping of the key with no antenna, or with the wrong antenna. I killed the final in one homebrew rig several times before I installed a zener, and it's never broken in the many years since. Choosing the value for a zener may be a little tricky, though. If the final is running class A the collector voltage will go up to around twice the supply voltage. A class B or C final may experience higher voltages. I'd size the zener to a bit lower than the breakdown voltage of the final transistor. 36 volts is reasonable for a 12-volt supply rig, but may be too low, depending on the output matching

network. If the output noticeably changes when the zener is added (and you've modified the output network as described below) or if the zener gets warm, the voltage is too low.

Zeners have a significant amount of capacitance. A 36-volt zener may run a few tens of ohms for a 400 mW zener, more for a higher-power one. You'll have to reduce the input C of your final's output matching network to compensate. A 400 mW zener is adequate for rigs in the 3-5 watt class. You should be able to get a zener from any mail-order house that sells components.

Connect the zener as directly as possible, with leads as short as possible, from the final collector to emitter. The cathode (band) goes toward the collector. Use it as an ADDITION to a transmatch, not a SUBSTITUTE!

>flourescent!!! I guess there aren't any physical samples yet.
>
From what I have heard they are indeed compact flourescents, but with
a color temperature much closer to incandescent lighting (about 2800 K?)
Also, they induce the activity in the gas through a high-frequency
radio emission from the base of the lamp, rather than high-voltage
low-frequency electrodes as in regular flourescent lamps, so there is
no actual electrical wire connection to the lamp itself, only to the
"transmitter" in the base. They last longer because there is no
electrode to decompose. The company that makes these touts them as the
greatest advance since Edison, but Nikola Tesla (who else?) was doing
experiments with this type of illumination at the turn of the century.
Tesla put a high-frequency electrical grid in the walls of a room, so
you could move the flourescent tube anywhere in the room, no wires
attached, and it would continue to put out light.
Now THAT's an innovation!

3250. Re: Is HF gear over priced?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-10 01:15:55 UTC
From: lyndon@ampr.ab.ca
Message-ID: <67@ampr.ab.ca>
Source record: 288865

I, too, have to wonder what the extra $2000 for a TS-850 gets me
that a TS-450 doesn't have. Most of the difference seems to be in
filtering and better receiver performance. I don't see much to
justify the price difference, though.

As for bells & whistles, a lot of this is just fancier software. The
incremental hardware cost isn't that much on a per-unit manufacturing
basis: a few more switches to interface to it, and a larger cabinet to
hold the switches.

Something I don't see any real numbers for:

1) What are the costs of designing something like an
FT-1000 these days? I'm talking full cost from the
concept stage to producing a product that's ready
for FCC acceptance testing?

2) What does it cost to get type acceptance from the
FCC, DOC, UL, CSA, and whatever other gov't organizations
who want to get their fingers into things before the rig
can go to market?

3) What are the costs involved in tooling up the production
line?

4) How many FT-1000 class rigs can a manufacturer expect
to sell over the products lifetime?

Items 1 and 2 are fixed costs, regardless of the amount of bells&whistles.
Number 3 would vary to a certain extent based on the tooling to handle
(say) additional filtering, etc.

The manufacturers must price their gear to recover these costs. The
per-unit cost depends directly on number 4. In the case of something
like a TS-950, the price of the additional RF circuitry drives up the
manufacturing cost. This reduces the number of rigs that you can expect
to sell, driving up the recovery cost, ...

I would be *very* interested in seeing some hard numbers for the
above four items. I doubt that the manufacturers are going to make
them available, though.

Maybe we need more homebrew articles in QST :-)

From: dbushong@wang.com
Message-ID: <bplzf2.1ip@wang.com>
Source record: 288868

I have an Icom IC-745 (yes, the one that supposedly has the control program in battery-powered RAM) and a couple of years ago, I turned it on and the S-meter swung up to +60; the transmitter stopped transmitting, and the thing just kinda stopped working. I planned to get an estimate from Icom, or find a maintenance book, but what I did was just put it on the shelf, next to the (still working) AT-100 automatic antenna tuner (which is too-cool in contests).

How come Icom never pushed the '745? What a great rig it was/is! This was the only problem I ever had with it, after 5 years of heavy usage. I haven't gotten it fixed because we have a club station at work and I can't put up antennas at home. And because I'm lazy, probably.

I'd like to hear about your IC-745 story! E-mail or post. Particularly if you have a good or bad experience related to the battery-powered RAM situation.

Regards, and 73,
Dave

>Can anyone tell me what size of wire is needed to act as a roughly 30 A
>fuse?

Although I didn't make it clear in the original message, it is not possible to install a new fuseholder and run wires to where the original fusible link was - there just isn't space in the case. Nor can I use conventional PC-mount fuse clips, because there isn't room for the length of a standard 3AG fuse.

One person who replied to the posting suggested taking an old Volkswagen fuse and removing the metal element from the insulating carrier. That might have worked, but while thinking about it I found a better solution:

I took an automotive blade-type fuse rated at 30A, trimmed off some of the length of the blades, bent the remaining blades over at 90 degrees, tinned them, and then just soldered the fuse to the circuit board. It's small and fits in the available space, the blade spacing was right, and it even comes with an insulating cover.

Solder-mount fuse clips for this style of fuse would have made a more professional job, but I've never seen any. Since I don't expect to blow this fuse again, soldering it in is not a bad functional compromise.

Save me a couple of phone calls. What are the Writer's Rates for
the two magazines? I have a couple of articles written and I need
to decide whether to sell 'em to the ham rag - almost guaranteed
publication but maybe not so much money - or to try and sell 'em to
the more traditional rags like R-E - probably much more money but
maybe not so easy to sell.

FM ATV channels are from 15 to 45 MHz wide depending on the amount of FM improvement desired. TV is by nature a wideband activity that requires uncrowded spectrum to operate effectively. The 420-450 MHz band is no longer uncrowded. Like AM and spark on HF, ATV must give way to narrower modes as the bands fill up.

In the UK, TV was a socialist government enterprise during the phase in
period. The government doesn't have to show quarterly profits. TV is both
private and commercial in the US. It's revenues are geared to a mass
audience. It's an example of the chicken and egg meeting Wall Street.

Actually there are still a lot of code wheels spinning out there, even
in the commercial world. They're simple, easily maintained, rather
immune to lightning induced surges, and with the advent of lots of
surplus turntables thanks to the CD revolution, extremely cheap.
Better is often the enemy of good enough.

For many years the auto industry's pricing followed the pricing of raw hamburger. Cars cost about the same per pound as raw hamburger. Today, in addition to inflation, federal standards have driven the cost of automobiles to more closely track ribeye steak. That's the "meat" theory of auto pricing.

Source record: 288784

Greetings,

I have been reading these postings regarding the cost of current
and past radio gear. I suspect that the cost of gear is partly
dependent on what the market will bare. If you appliance operators
believe that the cost is justifiable then so will the manufacturers.
When the ALL POWERFUL consumer gives in to the high prices, then you
are at fault. If more of you would complain, and refuse to purchase
the very high priced gear, then the manufacturers/retailers.. will
have to offer gear at a more reasonable price.

Because todays typical amateur radio OPERATOR is what I call an
appliance operator (plug it into the wall, ship it back to the
factory, splatter all over because he doesn't know that a linear
should be LINEAR, sounds like garbage because more audio is better,
starts a QSO 1 Kc from an existing QSO, runs 1500 watts PEP because
the guy next door is, doesn't know that you can make your own antenna..)
she/he has limited alternatives.

Homebrew is something that many believe can't be done. It isn't!!!!!!
Are you all afraid of tubes and transistors? My first transmitter was
a Knight T-50 rock bound with a single 807 in the final and a Knight
R-100 general coverage receiver, it cost me $50 in 1980.

There is no way that I can afford anything that costs over $150, and
it isn't worth that much to me. This is a hobby. I want to have fun.
I like to build and spend about 65% of my free time building.

If you are concerned about complexity than build simple. CW transmitters
are extremely easy, and AM transmitters aren't that hard either. I
recently built up a 1500W PEP high-level modulated AM XMTR from junk box
and trashed TV sets/radios, cost out of my pocket= $20 for 4-400A.
And building up SSB gear isn't that hard if your objective is cost.
Grab an old handbook at a hamfest. Many components aren't critical at HF

If anyone needs some help, email me. Stop complaining and lets start
doing something about it. Build, it's fun, you'll learn, it can be cheap
and you'll have a lot more to talk about with your buddies.

Try the K4GCC repeater on Merritt Island (146.940-) for KSC stuff.
Lots of retired KSC types hang out here. This repeater carries NASA
select audio during NASA launches (not during commercial or military
launches of course). The locals monitor this repeater to help ham
tourists visiting the area.

DisneyWorld ARC has a repeater on 147.300+. I used it while at EPsnot
Center and was not shot by the security personnel 8) (The original post
wanted to know if there were restrictions about using handhelds at EPCOT.
I am not aware of any (but I didn't ask or look for fine print). I guess I
would avoid using a handheld on any rides/etc to avoid disturbing other
guests. I took the computer tour and it seems that all the rides are
controlled by one massive mainframe computer 8(That MIGHT mean that the
rides themselves are relatively RF resistant?? The usual disclaimers apply,
your mileage may vary 8)

Well, in my case, about 10 MHz at the -60dBc points, but that's with
the modulation turned _way_ down and no sound carrier. So it is
possible to be 'narrow' with FM.

<Russ goes on to advocate constructing your own equipment, condeming those that do not. It is that condemnation that I address here>

Russ, things aren't always so black and white. There may be quite a number of people that simply don't have the time, equipment or experience necessary to complete a construction project. You obviously have all three, but lack money. That's okay. I'm glad that you can do that. Consider though the fellow that lacks one of the above but DOES have money. Say, a young professional, trying to get his carreer established and a family started. He may have only a couple of hours a week to spend on his new hobby. What's a guy like that supposed to do? Stay off the air for a month, spending his radio time on a construction project? Some may say "yes", but I believe those folks are actually ELECTRONICS hobbiests, not RADIO hobbiests. (The lines DO get fuzzy.)

Personally, I'd love to be able to do a LOT of interesting things. I'd like to finish a home remodeling project, get back into my photographic darkroom, build swell electronic 'stuff', play more with my children, work all states on the radio..... But I have less than a dozen hours a week that aren't already spoken for.

From the procurement of the materials to the tune up of the rig, I don't think I could make a radio of the same capability as my icom 735 in less than two years, and that's TOO long. I'd loose interest after the first month or two.

As for me, I'll spend the money for things I want so I have the time available to do some of the things that I need to do and that I want to do.

That may not be the choice YOU make. That's okay. It's a great hobby with lots of room for lots of different approaches. Please don't assume that everyone that buys a radio is doing so because of slothfulness. For some people it's the ONLY way they can get into

the hobby.

As for the cost of the equipment.... I see it as cheaper (costs fewer of my working hours) now than ever before. Granted it may look expensive, but it always has. So do houses, so do groceries, so do cameras.... so do engineers, so do doctors, so do (fill in the blank). Let's face it. The dollar isn't worth the same as it was a year ago or a decade ago or 50 years ago. An objective person would attempt to compare costs in some kind of constant units like hours of work.

I've heard that for a low volume high tech (high engineering cost) commodity, the sale price must be something like ten times the materials cost in order to make money. I don't know if that's true, but it sounds good to me.

(P.S. I'm not that young professional. I'm not young, I'm not quite a professional, and the family is already quite established.....)

> cw 5wpm -- > 160 and 80 m
> cw 12wpm -- > all band

Just to clear up any possible misconceptions out there, I'd like to mention that although the above tends to reflect how the Canadian licensing ends up working in practice, the description isn't isn't quite accurate

First of all, Canada doesn't really have license classes anymore. The qualifications Rejean mentions are actually orthogonal certifications that can be obtained in any order or combination you want (although some combinations are a bit useless -- more on this later).

Secondly, the Basic Qualification doesn't get you only 2m and 70cm; it gets you everything from 30 MHz to daylight.

To quote the DOC RIC-24 (Dept of Communications Radio Information Circular 24):

==========

Basic Qualification:

The holder of the amateur radio operator's certificate with the Basic Qualification may:
1. Operate on all frequencies above 30 MHz, using all classes of emissions,
2. use a maximum of 250 watts DC transmitter input power, and
3. build and operate all station equipment, except for "home-made" transmitters.

Morse Code (5 w.p.m.) Qualification:

Individuals who hold this qualification, as well as the Basic Qualification, may operate in any amateur frequency band below 4 MHz, using the classes of emission per Schedule II of the General Radio Regulations, Part II (GR2)

Morse Code (12 w.p.m.) Qualification:

Individuals who hold this qualification, as well as the Basic Qualification, may operate in any amateur frequency band below 30 MHz, using the classes of emission per Schedule II of the General Radio Regulations, Part II (GR2)

Advanced Qualification:

Individuals who hold this qualification, as well as the
Basic Qualification, may:
1. build and operate transmitting equipment
2. use maximum transmitter power of 1000 watts DC input
3. sponsor repeater and club stations, and
4. remotely control fixed stations, including the use of radio links.

==========

To be really picky, that makes 16 different combinations. Of these, 8
are useless because they don't include BASIC. Of the remaining 8,
2 are redundant (B+5+12+A == B+12+A, and B+5+12 == B+12) leaving 6
significant combinations.

For example, if you get Basic and 12wpm, you are allowed to run your typical
100W-output HF rig on any HF band you want. You don't need the Advanced
Qualification to do this.

Of course, there are better things to homebrew than radios. I'm working on a couple of projects that represent things that are unavailable commercially. I've got a Kenwood TS440 (I had a temporary money flush) and a TenTec Triton that I got for less than $200. Actually until very recently, I never owned a new radio. I got started with used ARC-5's, HW-16, DX-60/HR-10/HG-10. You can still find older tube SSB rigs for very cheap, indeed.

3276. DC auto chargers for FT-470

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-10 17:00:44 UTC
From: stevem@zimmer.CSUFresno.EDU
Message-ID: <1992Jun10.170044.25314@CSUFresno.EDU>
Source record: 288800

[trouble with our news software.. sorry if this is a repost]

I saw a universal DC-DC converter in a auto parts store the
other day that converted the 13.5 volts from an auto cigarette
lighter to 9 volts. I'm wondering if I can use something like
this to charge the battery on my Yaesu FT-470. The AC charger
for the same battery says it outputs 8.7 volts. Is this
difference something I should be concerned with? Can I use
this DC-DC converter without harming the battery (or worse)
on my 470?

Any advice, suggestions, or warnings appreciated.

--steve

P.S. I would just buy the cigarette charger from Yaesu, but
I am going on a road trip soon and do not have the time
to wait for it to arrive.

3277. Battery Packs

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-10 17:06:16 UTC
From: srm@dimacs.rutgers.edu
Message-ID: <Jun.10.13.06.16.1992.25744@dimacs.rutgers.edu>
Source record: 288791
Cross-posted to: rec.video,rec.radio.amateur.misc

I have recently taken two 6 volt Panasonic batteries salvaged from a UPS and put them in a bag to produce a 12 volt battery pack. I'm currently using this for a video camera light. I need to understand a few things for both building more battery packs like this for my video equipment and my ham equipment (just starting in ham - studying for my tech lic.).

1) Sorry I don't have much detail on the batteries I'm using now but my most basic question is, how can I calculate the useable time of a battery under drain from video/ham equipment. If the explaination could be in layman terms. My electronics background is minimal.

2) How can I test the remaining capacity of a battery to determine whether it comming to the end of it's charge.

I hope these questions a phrase correctly and I appreciate any help in these two issues. Thanks...

Yeah, because if they don't, their competition will have an option they do not, and hence everyone will buy the competition to get the widgy feature.

Creeping featurism is not a engineering or manufacturing problem. It is strictly a MARKET phenomenon.

Source record: 288801

I also have some Nickel Metal Hydride cells. You didn't say what source you were trying to charge this from. No way you will be able to charge these in any reasonable time with a "wall charger". It can't push enough current.

Specs for the batteries I have suggest 360 mA for 4-5 hours or 1.3 Amps for 1.0-1.2 hours (dangerous). Trikle charge is 60mA.

My suggestion is -- get a real battery charger. Good guideline is to charge the AA as if they were C cells.

I use a Radio Shack "Quick Charger" (5.5 hrs) and slightly tilt the cells so the AA cells make contact with the C terminal contact points. Works great. RS Quick Charge on C cells is approx 234 mA. Watch the time.

3280. Re: R U sick of QRP in QST?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-10 17:22:17 UTC
From: lowell@techbook.com
Message-ID: <1992Jun10.172217.9088@techbook.com>
Source record: 288738

I read every design article I can get my hands on. My biggest complaint about the articles are that they are construction not design articles. I would like to see more information concerning things like:
1) What is the designed gain for each stage.
2) What are the input and output impediances of the stages.
3) How does opperation change at different power supply voltages (very important if you opperate from batteries).
4) How stable is the transmitter under widely varying load conditions.
5) Example waveforms of important nodes would be useful as well as AC average voltage and DC bias point readings.

Unfortunatly, most of these are missing in the articles. Most of what we get are " I designed this neat rig and built it and you should build it too" but it is difficult to trouble shoot them or modify them without going through a reverse engineering phase first.

Keep the articles coming. I would really like to see an HF Synthesized QRP rig. I am working on one myself.

Thanks for the bandwidth. 73 Lowell (kc7dx)

3281. Re: Wouff-Hong

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-10 17:36:24 UTC
From: myers@hpfcso.FC.HP.COM
Message-ID: <103360090@hpfcso.FC.HP.COM>
Source record: 288734

The VERY short version is that one of the "Old Man" columns ran a story about the "old man" trying to understand what another station was saying; due to a poor fist at the transmitting end, the OM was copying nothing but garbage, among which were the words "wouff hong." At the conclusion of the column, the OM was musing about just what kind of gear a "wouff hong" might be, and what it would be used for. Somehow, this evolved into the useless tool shown in the picture. It seems a number of ops actually made up these things, and proudly displayed them in their stations.

3284. VHF Contest Skeds de W2SZ/1

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-10 17:58:50 UTC
From: parish@think.com
Message-ID: <115fsqINNd5h@early-bird.think.com>
Source record: 288795

W2SZ/1 will be operating on 144.160 MHz CW and 50.160 MHz USB late at night (after say 0500 UTC). On 2 meters, we will call on the even-numbered minutes and be listening for replies during odd minutes (synchronized with WWV). If you have any higher bands, we can pass you up there as well.

W2SZ/1 is active on all bands through 24 GHz. Our 2 meter system consists of 4 long (NBS) Yagis stacked vertically, LNA on receive, and a full KW (8877) on transmit. We run a full KW on 50, 222, and 432 MHz as well. We run 300 W on 903 and 100 W on 1296 MHz into 6 foot dishes. We have narrowband CW stations on 2304 and 3456 MHz running 20-30 Watts and on 5760 MHz we run about 5 Watts CW/SSB. On 10 GHz we have a wideband (75 kHz Deviation) FM station on 10.250 GHz running 50 mW into a 4-foot dish. We also have 10.368 GHz CW/SSB with 50 Watts output into a 6-foot dish! On 24 GHz we have a wideband FM station operating on 24.125 GHz with 60 mW into a 30 inch dish. We encourage you to try playing on some of these higher bands, if you don't already!

Many of our microwave contacts are made with hams from our local area who have agreed to take portable microwave equipment to various grid squares during the contest. Some of these hardy individuals climb mountains in nearby squares.

Let's make the ham bands really hum with activity during this contest, and you may also work some other rare grids in our direction late at night when band conditions are more favorable.

You can arrange a sked on any of the lower bands (50MHz through 1.2GHz) by contacting Dave (cipolle@ll.mit.edu) or Ed (parish@Think.COM). You can arrange for skeds on the higher microwave bands by contacting Dick (frey@dspuv2.crd.ge.com). Please try and contact us before Thursday evening, June 11.

3285. Re: METEOR SHOWERS BY RADIO

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-10 18:26:00 UTC
From: rpo@trsvax.tandy.com
Message-ID: <1787700008@trsvax>
Source record: 288731

Have not seen anything on monitoring by radio, but I did see an article in the first issue of Science PROBE magazine on monitoring using a TV. As I recall (this is from memory only) you tune to a TV station several hundred miles away (outside the normal broadcast range). When the meteorite hits the atmosphere, the ionization trail reflects the TV station's signal, and you get 3-4 seconds of clear picture.

3286. Great Use for the New Bulbs

Newsgroup: rec.radio.amateur.misc

From: giasij@rs6213.ecs.rpi.edu
Message-ID: <hnnwan#@rpi.edu>
Source record: 288808

When/If these new bulbs come out, you bet I am going to grab a few
to tape near the top of the tower for a neat light show when operating CW..
It would be really neat to sit out on the porch during a test and be able
to 'SWL' the operation! Also it would eliminate the need of having a
super spotlight when the rotor indicator goes down... just key down
and your lit! :-)

It will sure beat the 'lightsaber' battles I have had with friends when
we would fire up a transmitter and wave flouresent bulbs around in the
antennas near field.. sure was fun watching people looking out there windows
at us... (the antenna was a vertical atop a car)... the bulbs look really
eerie and you have to stay pretty close to the antenna to keep them going..
if they go out we would just touch one end to the whip and blammo, back
in business... too bad we couldn't actually swordfight with em...
oh well... back to the grind

In article <9206051411.AA12842@eeiua> eeiswh@eeiua.ericsson.SE (Simon Woodworth) writes:
>I remember hearing of a device called UQC (alright, it was in Orson Scott Card's novelisation of
>The Abyss so I don't know whether such a device exists) which shifts normal sound frequencies into
>ultrasonic ones which travel much further in water.

There certainly are such devices. I don't know anything about
model numbers, power levels, etc, but it is a common practice to turn voice
into a SSB, probably lower sideband, signal with a center carrier frequency
of several KHZ. I remember one "National Geographic" type program where
several researchers were photographed going about their work in a deap-sea
craft which used sonic communication to talk with their mother ship. The
camera was in the little craft and one could hear a little bit of the
SSB signal mixing with the person's voice. It was probably crosstalk between
the electronics of the sonic communication system and the microphone picking
up the TV audio. They also have a CW key to use when voice is not useable.
The sound quality of the received signal is a bit strange. There are echoes
from the bottom and from areas of different salinity and temperature.
It is sort of like listening to a statium announcer.

In article <1992Jun10.060153.16173@ke4zv.uucp> gary@ke4zv.UUCP (Gary Coffman) writes:
+In the UK, TV was a socialist government enterprise during the phase in
+period. The government doesn't have to show quarterly profits. TV is both
+private and commercial in the US. It's revenues are geared to a mass
+audience. It's an example of the chicken and egg meeting Wall Street.

..on acid..in the rain..with the audience being the loser everytime! The real reason that the Amateur Opertor is prevented from broadcasting is that the commercial guys would lose a good percentage of their market share to the specific-interest viewers as is happening on cable now with the special-interest channels (ala "Comedy Network", "Cartoon Channel", "The Sci Fi Channel", etc) and the network a**holes are mad over this. In fact in the L.A. area there is some considerable evidence that the local and network broadcasters have been instrumental in BLOCKING cable companies from carrying "The Sci Fi Channel"! As if Sci Fi fans are going to watch their rotten-QRM that passes as sitcoms! If it were up to me, I'd shoot those goddamn, braindead New York writers (and their deadlock Guild of Friends & Family) that crank out that slop and replace their timeslots with public-access discussions, or whatever the locals wanted to watch..even if it was reruns or old movies..look at the success that 'Nick-At-Nite' has become. The "professionals" in the broadcast industry would windup on the streets if "amateurs" were allowed to compete...that's why the FCC forbade it in the beginning, to *eliminate* the chance that the money interests would lose to the interested-but-just-for-fun crowd.

Face it: where money and media meet, the viewer/reader/consumer is always the loser..right behind the original author and the talented performer!

This is known as the 'Brother-In Law Effect'; which states that "The cultural/scientific/etc. content of anything is inversely proportional to the number nepotistically appointed hangers-on that participate in the effort!"

(this also holds true for most other things...like Spacecraft built and tested by 'the good-ole-Boys-NASA' where being wrong dosen't count if you're related to someone high-up enough! (screw you Darryl!))

Even if a flourescent tube were run on pure, filtered DC, there would be some RF noise. The electronic activity of the excited gas in the tube produces some radio noise. I believe that Neon bulbs are even used as white noise generators in vaccuum-tube type equipment that needed a noise source.

In rec.radio.amateur.misc, jbloom@arrl.org (Jon Bloom) writes:

>In fact, there is an
>opportunity to change some aspects of QEX right now. I solicit any
>suggestions anyone has for improvements to QEX.

How about sending a personal letter to each of the Ham Radio Magazine
authors who wrote good articles in the last years of HR. Tell them
about the plans for the new and imporved QEX. Ask them what they are
working on now and if they would be interested in writing for QEX.

Regarding article ideas. How about tutorials on a higher technical
level than would be appropriate in QST? For example, people seem to
think that digital filter design is way beyond the non-engineer, but
the basics are pretty straightforward. A fairly non-mathematical
treatment of modulation theory could help explain what QAM is, for
example, and how you can transmit 9600 bits per second through a
3 kHz audio channel. In rec.radio.amateur.packet, I see a lot of
references to KA9Q, NOS, Baycom, Rose, TCP/IP, and other alphabet
soup. How about a tutorial giving a quick overview of the state
of packet radio today, covering all the latest buzzwords? While
we're at it, how about a tutorial on the Internet and how to get
connected, for those not in the know? Phase-locked loop synthesizers
are a mystery to some. I'll bet one could write a non-mathematical
treatment that would be of interest to many. (e.g. Just what is
direct digital synthesis, and how does it differ from a PLL?)

QEX would be the perfect place for construction articles about
sub-systems of complete receivers/transmitters. For example,
just the local oscillator or just the IF/AGC system.

How about an article on measuring receiver and transmitter
specs (phase noise, noise figure, etc.) Wes Hayward's
QST article was a long time ago.

You can do better than that - most any good hamfest or issue of the yellow sheets will have a Drake C-line for sale (R4C + T4XC + p/s) for around $500 or so. No, it isn't NEW, but who cares - it`s a really really good rig. It isn't hard to find them in very good shape - they were expensive when new and people generally took good care of them. I'm sure there are other used rigs that offer great value as well, but everyone I've ever talked to with a C-line loves it. No memories, no digital readout (but easy to read within .25 Khz), but you get split, a quiet/sensitive/selective receiver, a good stable transmitter, and convenient transceiver operation. Save the environment - recycle old radios !!

>--scott

Gary is a lot more knowledgable about this than I am, I am sure, but it seems to me that there was a proposed phase-out of VHF television broadcasting (channels 2 - 13) once upon a time. As I remember, there was a lot of discussion about this, and after a certain year, all TV receivers had to have UHF receive capability. The VHF TV stations supposedly would get their UHF channel assignment, fire up and simulcast for some period of time, then shut down the VHF transmitter for good. Eventually, all of the VHF space that became free would be used for public service communications and other things. So then, channels 14 through 83 would have been available for TV broadcasting. It would not surprise me if some special interest groups got this plan tabled or scrapped somehow, and things just kept going, except that now all the TVs had UHF as well as VHF capability. But just consider the fewer TVI problems we would have had if VHF TV had been phased out. Maybe it is not too late.

Here in Utah, the major market TV stations here in Salt Lake City have UHF repeater/translator transmitters all over the state of Utah, and even in the adjoining states (NV, WY, ID and AZ). It seems that this might be another cost effective way of doing things since all of the repeater/translators are probably unattended.

Tnx for all your help on this TS 830S I thought was not working.

When I plugged in the key as per manual for tune- up, everything clicked and w worked perfectly!

I think there was just dust on the relay.

THis is a one owner rig from an estate with wide SB filter, Kenwood mobile PTT% mike, and manual. I ran it here and it is FB city.

If you are interested in such a rig, let me know here.

Tnx again

To slow charge your battery (like the wall charger does), the voltage is not as important (it has to be higher than the battery) as the current limitting. You don't want to put more than about 40ma into the battery.

Actually the DC-DC conveter is unnecessary. You can just get the PA6 DC jack for the radio (it slides between the battery and the radio). In addition to powering the radio, if there is a battery there (other than one of the 13.2 V ones) it will charge the battery.

Scott, I'd go further than that and make cable TV illegal also. The only TV available will be DBS satellite transmissions on microwave bands. This would free up lots of Mhz, remove 1000's of miles of hardline, and also cure most TVI.

Now, what are you going to do with all those Mhz? There will be lots of surplus 75 ohm hardline available, not to mention lots of unused TV transmitter towers.

For what it's worth, the UK four metre band allocation is not between 72-76MHz, rather being 70.010-70.500 MHz. It would, therefore, be no closer to a broadcast TV channel than the six metre band is relative to channel two (in fact, it would have a 1.5MHz guard-band).

>UHF and reallocate the VHF TV band to land moble service like the
>Brits did in the UK.

That is the plan. Current VHF TV will be reallocated to ground-based "personal communication" services. FCC expects the transition to take 15-20 years. I suspect it will happen a little faster as HDTV receivers appear much cheaper to produce than expected due to advances in computer display and compression technologies.

Some of the emerging satellite-based direct brodcast TV companies are currently transmitting compressed digital RGB. These companies will probably offer HDTV services in 2-3 years.

I live in Redwood Valley, Mendocino. On my roof, I have a 20' pole with a 'dish' TV antenna on it. When I say 'dish', what I mean is that the rear reflectors are vertical tubes which are curved in such a way as to form a dish shape to concentrate the received signal to the collector array in front. I am going to mount this on a rotator in an attempt to improve the signal strength.

My question is this : does anyone in netland have any experience with this type of antenna ? Would I expect an improvement in picture quality if I replaced it with a new full-sized Yagi TV array ? Given that I live in a TV fringe area, and I don't want to take down the antenna pole more than once, does anyone have any suggestions ?

Thanks,

John Mcleod N6RCD.

I would like to publically thank everyone of you that replied to my message about the blown transistor. I posted the message yesterday and today got 40 whopping messages! WOW. Thanx alot!! Well, it seems that I will be getting a random-wire tuner or even making a dipole and getting a good MFJ tuner, but there is still the issue of protecting the transistor. A 36V 400mW seems good to me, but I can't find it at Radio Shack or EasyTech or anywhere else. Does somebody know where I can find one and how much they cost?

Thanx again for the replies!! Amateur radio and internet work REALLY WELL TOGETHER!! I will get that tuner AS SOON AS POSSIBLE, as I will be operating QRP in the midst of the "bush of Ontario" this summer (part of a fly-in fishing trip).

Thanx once more...

From: Mike.Riddle@ivgate.omahug.org (Mike Riddle)
Subject: New Bell Labs Findings! (Humor)
Reply-To: mike.riddle@inns.omahug.org
Organization: Inns of Court, Papillion, NE

A Humorous Interlude stolen from a local BBS, original source unknown:

A Light In The Dark

Bell Labs Prove Existence of Dark Suckers
(Reprinted from the Bell Labs Newsletter)

For years it has been believed that electric bulbs emit light. However, recent information from Bell Labs has proven otherwise. Electric bulbs do not emit light, they suck dark. Thus they are now called dark suckers. The Dark Sucker Theory, according to a Bell Labs spokesperon, proves the existence of dark, that dark has a mass heavier than that of light, and that dark travels faster than light.

The basis of the Dark Sucker Theory is that electric bulbs suck dark. Take for example the dark suckers in the room where you are. There is less dark in the immediate area of the dark suckers than there is elsewhere in the room. The larger the dark sucker, the greater its capacity to suck dark. Dark suckers in a parking lot have a much greater capacity than the ones in this room. As with all things, dark suckers don't last forever. Once they are full of dark they can no longer suck. This is proven by the black spot on a full dark sucker. A candle is a primitive dark sucker. A new candle has a white wick. You will notice that, after the first use, the wic turns black -- representing all the dark which has been sucked into it. If you hold a pencil next to the wick of an operating candle, the tip will turn black because it got in the way of the dark flowing into the candle.

Unfortunately, these primitive dark suckers have a very limited range. There are, fortunately, portable dark suckers. The bulbs in these cannot handle all of the dark by themselves, and require the use of additional dark storage units. When the dark storage unit, referred to by some as a battery, is full it must either be emptied or replaced before the portable dark sucker can operate again.

Dark has mass. When dark goes into a dark sucker, friction from this mass generates heat. Thus it is not wise to touch an operating dark sucker. Candles present a special hazard because the dark must travel in the solid wick instead of through glass. This generates a large quantity of heat, which makes it inadvisable to touch an operating candle.

Dark is also heavier than light. If you swim deeper and deeper you notice that it slowly gets darker and darker. When you reach a depth of aproximately 80 meters, you are in total darkness. This is because the heavier dark sinks to the bottom of the water and the lighter light floats to the top. The immense power of dark can be utilized to humankind's advantage. Dark which has settled to the bottoms of lakes can be pushed through turbines to generate electricity. In this way dark can be forced into the oceans where it can be safely stored.

Prior to the invention of the turbine it was much more difficult to get dark from rivers and lakes to the oceans. The Indians recognized this problem and tried to solve it. When on a river in a canoe traveling in the same direction as the flow of dark, Indians paddled slowly, so as not to stop the flow of dark. When they traveled against the flow of dark they paddled quickly to help push the dark along its way.

Finally, it becomes clear that dark is faster than light. If you stand in an illuminated room in fromt of a closed, dark closet you notice that, as you slowly open the closet door, light slowly enters the closet. However the dark moves so quickly that you are not able to see the dark leave the closet.

In conclusion, scientists from the Bell Labs have noted that dark suckers make our lives easier and more enjoyable. So the next time you look at an electric bulb remember that its function is actually that of a dark sucker.

From: jga@dreaml.wariat.org
Message-ID: <gBe7LB1w164w@dreaml.wariat.org>
Source record: 288824

I recently had the opertunity to borrow a pair of Motorola HTX-800 trunked radios. They were for sure 800 MHz, operating on repeaters, and one of them was also a phone. What I need to know is this: What frequency? The bottom of the units had a section that looked like this:

```
+---------------+
! NTN 5447 B !
! Alternate to: !
! NTN 4824 A !
! NTN 5447 A !
! NTN 5049 A !
+---------------+
```

Any ideas?

Source record: 288821

On May 30, 1992, I attended the Highland Heights, KY ARRL/VEC testing session. I brought at copy of my current General class license and a properly completed FCC Form 610 to the session. Although I only expected to upgrade to Advanced, I passed elements 4A, 4B, and 1C, thus qualifying me for the Extra class.

Several days later I recieved a notice from one of the administering VE's that said basically, "The form 610 you completed for this test session is being held at the ARRL/VEC office pending the receipt of a photocopy of your pending license upgrade."

I called one of the VE's and he explained that my Advanced class license will be issued first and then I will have to send in a copy of that and then my Extra will be issued.

Will I need to send in a separate form 610? Will the VEC copy the one I submitted on 5/30/92 at the testing session?

Any info will be appreciated!

Source record: 288729

I just wanted to let anyone with an IC-2410 know that if you have the
original "stealth" display, the one you can't see in bright light,
ICOM is offering a FREE upgrade to the current display being shipped on
new production.

I don't know for sure if this is the official ICOM policy, but I do
know both myself and a friend have had this upgrade made, free of
charge, after calling ICOM in Washington and complaining about the
display.

The upgrade gets okay'ed by the parts department in Washington and then
they have you send the radio to Atlanta for the upgrade.

I shipped my unit out on Tuesday of last week and had it back by
Monday of this week. My radio was gone for only 6 days!
Most of this time was spent in shipping. ICOM actually made the
"repair" the same day they received the radio.

Good luck.

SB SAT @ AMSAT $ANS-151.01
DOVE TESTING CONTINUES

HR AMSAT NEWS SERVICE BULLETIN 151.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 30, 1992 BID:$ANS-151.01
TO ALL RADIO AMATEURS BT

DOVE Speech Developement And Testing Continues

The DOVE Recovery Team continues to monitor the DO-17 downlink frequency of 145.825 MHz and to examine the on-board computer (OBC) memory dumps. DOVE listeners have noted that the voice messaged has changed significantly since speech testing was commenced last weekend. At the present time the message has becomed "garbled" and unintelligible. The DOVE Recovery Team members are not sure of the exact cause of the message change but they have several theories that they are looking into. The most probable is that there is a software "bug" which is over writing the memory locations where the speech software resides. At the present time they do not feel that this is a set back and are so far pleased with the progress that they have made so far. Watch for further updates concerning DOVE in the AMSAT News Service (ANS) bulletins.

>Hi! Can anybody give me a feel for what sort of
>loss I would be taking using a wireless repeater
>for my handheld cellular phone vs using a wired
>antenna?

Lots. Maybe 20-30 db. Probably the best way to measure the
loss is whatever the "wireless repeater" cost you. (This device
is a gizmo that clips onto the window and has two antennas connected
together, one inside the car and one outside. Depending on how far
(in inches) the cell phone antenna is from the inside antenna, the
coupling quickly decreases to zero.)

>And building up SSB gear isn't that hard if your objective is cost.
>Grab an old handbook at a hamfest. Many components aren't critical at HF

A 1.5 kw AM rig for $20, amazing. I have 5 1.5 kw transmitters. The latest is a 1.5 kw FM rig for 2 meters. It uses a pair of 4-500As driven by an 829. The blowers alone cost over $200 used surplus. I also have a rig using a pair of 4-400As. The air sockets and chimneys cost over $150. According to the data sheets, a single 4-400A can only be pushed to 720 watts ICAS. That's at 4000 volts and 300 mils. I haven't seen many TV sets with power supplies capable of that. Nor have I seen many TVs with 500 CFM blowers. We won't even mention 500 watt audio amplifiers for the modulator, or the modulation transformer. It must weigh 80 pounds.

I think you are trying to pull our legs with this one. Building a legal limit transmitter for under $1000 I can believe, but for $20, I doubt it.

24AT Mods Help

Folks:

Has anyone performed the "2 diode" mod on Icom's 24AT? I'm having trouble discerning which of the empty positions on the pcb are the correct ones. I've gone over the Icom supplied schematics but many of the traces disappear into the inner layers of the pcb. Any help is greatly appreciated. (Obviously the file that I have does *not* have any specific info about the location of the relevant diodes; if there are other files with *any* details, let me know)

Thanks in advance!

3316. New Alinco 580 Users manual Rev 2.0

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-11 13:21:34 UTC
From: jay@sw.stratus.com
Message-ID: <3811@transfer.stratus.com>
Source record: 288740

I am happy to announce that version 2.0 is complete. This version has many improvements.
I have included many suggestions received from the network and by U.S. mail. This
This is the final version. As always, your suggestions are welcome. I don't plan to
make any further changes unless it is absolutely necessary. This manual is about 7 monthes
in the making and I hope you enjoy it as much as I did writing, testing and evaluating it.

Make your users manual query to : Jay_Appell@cac.stratus.com

If you don't receive a response within a reasonable period of time, do the following:

After 5pm eastern time call 1-800-458-0042. From a touch tone phone dial 2548.
Leave me voice mail with your internet address. Feel free to leave any suggestions
or general comments on voice mail after 5pm et also.

It has been stated by many that the advent of the electronic users manuals is long overdue.

Thanks to all who sent in comments.

Jay Appell (KA1SNA)

3317. Re: Upgrading from General to Extra Procedures?

In article <1992Jun11.004214.5505@news.ysu.edu> ad815@yfn.ysu.edu (John S. Kennedy) writes:

On May 30, 1992, I attended the Highland Heights, KY ARRL/VEC testing session. I brought at copy of my current General class license and a properly completed FCC Form 610 to the session. Although I only expected to upgrade to Advanced, I passed elements 4A, 4B, and 1C, thus qualifying me for the Extra class.

First off..... C O N G R A T U L A T I O N S ! You ought to be proud.

Several days later I recieved a notice from one of the administering VE's that said basically, "The form 610 you completed for this test session is being held at the ARRL/VEC office pending the receipt of a photocopy of your pending license upgrade."

I called one of the VE's and he explained that my Advanced class license will be issued first and then I will have to send in a copy of that and then my Extra will be issued.

Sounds rather odd to me. I've skipped classes at W5YI sessions without having to wait for intermediate licenses to arrive. I've never held a Novice license nor a General license.

I wonder why the VE team thought you wanted an Advanced license in the first place? Did you specify that when you filled out the 610? Did you fill out two of them, one for the Advanced, another for Extra?

Will I need to send in a separate form 610? Will the VEC copy the one I submitted on 5/30/92 at the testing session?

Yep. They can't send it in without a 610. Nope, they can't fill it out for you (you sign it claiming all the above is true... etc).

Now the issue of whether you get to pay again.......

Fortunatly, you can operate as an Extra on the authority of the CSCE while waiting for the paperwork to sort itself out.

See you on the low bands.

> During last weekend I did some experiments with my IC-W2e and NiH battary
> cells. For reference: these cells, available in regular AA size, have
> double the capacity normal NiCd cells have (1000 vs 500 mAH).

Just curious: where did you find these cells, and are they
expensive / how expensive are they?

I'd also like to know, if one can quick charge NiH cells like
those regular NiCd cells - pulse charge with 0.5-1 A pulses.. I
have currently the normal BP-83 battery that is shipped with
the radio, plus a BP-90 battery case, which now contains 500
mAh cells (plus two 12 V 3 Ah lead batteries, which give more
power, but they also are heavier.. need big pockets). More mAh
and less weight would sure be nice.

> dummyload FA-1443BB that comes with the rig. I don't know what it is made

Wonder if you can you recommend any.. ?-)

>
> Dave Martindale, dave@imax.com

Dave, do yourself a favor and use a 30 amp fuse. You can get in line fuse holders most any place... solder the wire ends of the holder into the circuit board and snap a fuse in.... or you can use a "pigtail" fuse that already has the wires attached to the fuse.

Copper wire doesn't burn in two fast enough to be a good fuse and I am surprised that a manufacturer would use the foil to save a few cents on a real fuse.

Source record: 288744

First of all, I want to thank all who responded to my recent request for the ARRL emblem in Postscript format. The QSL card design is progressing nicely, except for a small hitch. The person designing the card is using a software package that will not accept Encapsulated Postscript. It will accept the following:

* Adobe Illustrator (EPS)
* Adobe Illustrator (AI)
* Tag Image File (TIF)
* Z-Soft Image File (PCX)
* Windows Meta File (WMF)
* AutoCad Image File (DXF)
* MicroGrafx Draw (DRW)
* MicroGrafx Picture (PIC)

Knowing less than dirt about any of this myself, I find it necessary to again request the help of the Net. Does anyone have any of the above or know how to obtain any of the above? Please email to me directly.

Many thanks in advance.

73,
Charlie KD5PJ ocker@dseg1.csc.ti.com

This was actually documented in a GEARVARKf newsletter I picked up at the Dayton Hamvention a few years ago. Perhaps someone has saved a copy of it and can post the article to the net.

GEARVARKf is a ham organization in SW Ohio that publishes a truely bizarre newsletter that's available yearly at Dayton. Their articles range from the paper about "Dark Suckers", to a description of a fire that destroyed the 20M band during a DX contest. Any GEARVARKfers out there?

You should call the VEC office and tell them that you have no pending upgrade or else you will wait forever. The form they are sitting on appears to be the only outstanding 610 you have. Actually you can probably send them email now.

The VE you called is probably wrong, if you passed 4A, 4B, and 1C and had an existing general, you would never get an advanced class license issued (for example, I passed 1B and 4A simoultaneously and went from TECH->ADVANCED without ever getting a general).

Congratualtions on your EXTRA! When you call the ARRL VEC office you might want to ask them to send you VE accreditation procedures.

>working on now and if they would be interested in writing for QEX.

It is interesting that you make this request. QEX did just that in the latter part of 1991 and I, for one, responded with an article. Actually, I submitted four articles of varying degrees of technical level. The simpler and more beginner level was accepted for publication. Having tested those waters, I now have several more articles prepared for submission. All are at focused at the beginner to Novice level.

From my perspective, QEX has had a "start-up" problem that inhibited their ability to get their act together. But I suspect that those wrinkles will get ironed out and QEX will flow pretty well in the future.

The biggest issue I see about QEX is the lack of advertizing outside of the "ARRL world" distribution. QEX needs more exposure and must be easier to obtain on the book stands.

The "darksucker" is described in the following, which my son sent me
several years ago:

****

DARK CONSPIRACY INVOLVING ELECTRICAL POWER COMPANIES SURFACES

Original Author Unknown

****

For years the electrical utility companies have led the public to
believe they were in business to supply electricity to the consumer,
a service for which they charge a substantial rate. The recent
accidental acquisition of secret records from a well known power
company has led to a massive research campaign which positively
explodes several myths and exposes the massive hoax which has been
perpitrated upon the public by the power companies.

The most common hoax promoted the false concept that light bulbs
emitted light; in actuality these 'light' bulbs absorb DARK, which
is then transported back to the power generation stations via wire
networks. A more descriptive name has now been coined; the new
scientific name for the device is DARKSUCKER.

This newsletter introduces a brief synopsis of the darksucker theory,
which proves the existence of dark and establishes the fact that dark
has great mass, and further, that the dark particle (anti-photon) is
the fastest known particle in the universe. Apparently, even the
celebrated Dr. Albert Einstein did not suspect the truth...that just as
COLD is the absence of HEAT, LIGHT is actually the ABSENCE of DARK....
scientists have now proven that light does not really exist!

The basis of the darksucker theory is that electric light bulbs suck
dark. Take for example, the darksuckers in the room where you are
right now. There is much less dark right next to the darksuckers than
there is elsewhere, demonstrating their limited range. The larger the
darksucker, the greater its capacity to suck dark. Darksuckers in a
parking lot or on a football field have a much greater capacity than
the ones used in the home, for example.

It may come as a surprise to learn that darksuckers also operate on a
celestial scale; witness the Sun. Our Sun makes use of dense dark,

sucking it in from all the planets and intervening dark space. Naturally, the Sun is better able to suck dark from the planets which are situated closer to it, thus explaining why those planets appear brighter than do those which are far distant from the Sun.

Occassionally, the Sun actually oversucks; under those conditions, dark spots appear on the surface of the Sun. Scientists have long studied these 'sunspots' and are only recently beginning to realize that the dark spots represent leaks of high pressure dark because the Sun has oversucked dark to such an extent that some dark actually leaks back into space. This leakage of high pressure dark frequently causes problems with radio communications here on Earth due to collisions between the dark particles as they stream out into space at high velocities via the black 'holes' in the surface of the Sun.

As with all manmade devices, darksuckers have a finite lifetime caused by the fact that they are not 100% efficient at transmitting collected dark back to the power company via the wires from your home, causing dark to build up slowly within the device. Once they are full of accumulated dark, they can no longer suck. This condition can be observed by looking for the black spot on a full darksucker when it has reached maximum capacity of untransmitted dark...you have surely noticed that dark completely surrounds a full darksucker because it no longer has the capacity to suck any dark at all.

A candle is a primitive darksucker. A new candle has a white wick. You will notice that after the first use, the wick turns black, representing all the dark which has been sucked into it. If you hold a pencil next to the wick of an operating candle, the tip will turn black because it gets in the way of the dark flowing into the candle. It is of no use to plug a candle into an electrical outlet; it can only collect dark...it has no transmission capabilities. Unfortunately, these primitive darksuckers have a very limited range and are hazardous to operate because of the intense heat produced.

There are also portable darksuckers called flashlights. The bulbs in these devices collect dark which is passed to a dark storage unit called a battery. When the dark storage unit is full, it must be either emptied (a process called 'recharging') or replaced before the portable darksucker can continue to operate. If you break open a battery, you will find dense black dark inside, evidence that it is actually a compact dark storage unit.

The darksuckers on your automobile are high capacity units with great range, thus they require much larger dark storage units mounted under the hood of the vehicle. Since there is far more dark available in the winter season, automobile dark storage units reach capacity more frequently than they do in the summer, requiring 'recharging', or in severe cases, total replacement.

Dark has great mass. When dark is drawn into a darksucker, friction caused by the speed and mass of the dark particles (called anti-

photons) actually generates substantial heat, thus it is unwise to touch an operating dark sucker. Candles represent a special problem, as the dark must travel into a solid wick instead of through clear glass. This generates a great amount of heat, making it very dangerous to touch an operating candle.

Because dark has such great mass, it is very heavy. If you swim just below the surface of a lake, you see a lot of 'light' (absence of dark, to be more precise). As you go deeper and deeper beneath the surface, you will notice that it gets darker and darker. When you reach a depth of approximately fifty feet, you are in total darkness. This is because the heavier dark sinks to the bottom of the lake, making it appear 'lighter' near the surface.

The power companies have learned to use the dark which has settled to the bottom of lakes and rivers by pushing it through turbines, which generates the electricity used to pump the dark toward the ocean where it may be safely stored for their devious purposes.

Prior to the development of turbines, it was much more difficult to get the dark from the rivers and lakes to the ocean. The Indians recognized this problem, and developed means to assist the flow of dark on it's long journey to the ocean. When on a river in a canoe travelling in the same direction as the flow of dark, they paddled slowly, so as not to impede the flow of dark; but when they travelled against the flow of dark, they paddled vigorously to help propel the dark along its way.

Scientists are working feverishly to develop exotic new instrumentation with which to measure the actual speed and energy level of dark. While such instrumentation is beyond the capabilities of the average layman, you can actually perform a test to demonstrate the unbelievable speed of dark, right in your own home.

All that is required for the simple test is a closed desk drawer situated in a bright room. You know from past experience that the tightly shut drawer is FULL of dark. Now, place your hand firmly on the drawer's handle. Quickly yank the drawer open...the dark immediately disappears, demonstrating the blinding speed with which the dark travels to the nearest darksucker!

The secrets of dark are at present known only to the power companies. Dark must be very valuable, since they go to such lengths to collect it in vast quantitites. By some well hidden method, more modern power 'generation' facilities have devised methods to hide their collection of dark. The older facilities, however, usually have gargantuan piles of solidified dark in huge fenced in areas. Visitors to these facilities are told that the huge black piles of material are supplies of coal, but such is not the case.

The power companies have long used secret acronyms to disguise their activites; 'D.C.' stands for 'Dark Conspiracy', while 'A.C.' is

suspected to represent the 'Alternate Conspiracy' which will most likely be used exclusively once the secrets of D.C. are totally understood. D.C. is rapidly yielding it's secrets to the probing eyes and instruments of honest scientists around the world. The U.S. Attorney General is considering action to be taken against the power companies for the theft and stockpiling of dark from 'consumers'. New developments are being announced every day and we promise to keep the public informed of these announcements as they occur via this newsletter.

Subject: Electricity

The Heavy and Dark story is not the one that I had in mind (Brian Kantor turned it up, and it is attached) but thanks anyway.

- ASK DAVE: W H A T I S E L E C T R I C I T Y ? -

Or, how science columns should be written.

-By Dave Barry

Today's scientific question is: What in the world is electricity?

And where does it go after it leaves the toaster?

Here is a simple experiment that will teach you an important electrical lesson: On a cool, dry day, scuff your feet along a carpet, then reach your hand into a friend's mouth and touch one of his dental fillings. Did you notice how your friend twitched violently and cried out in pain? This teaches us that electricity can be a very powerful force, but we must never use it to hurt others unless we need to learn an important electrical lesson.

It also teaches us how an electrical circuit works. When you scuffed your feet, you picked up batches of "elec- trons," which are very small objects that carpet manufactur- ers weave into carpets so they will attract dirt. The elec- trons travel through your bloodstream and collect in your finger, where they form a spark that leaps to your friend's filling, then travels down to his feet and back into the carpet, thus completing the circuit.

Amazing Electronic Fact: If you scuffed your feet long enough without touching anything, you would build up so many electrons that your finger would explode! But this is noth- ing to worry about unless you have carpeting.

Although we modern persons tend to take our electric lights, radios, mixers, etc. for granted, hundreds of years ago people did not have any of these things, which is just as well because there was no place to plug them in. Then along came the first

Electrical Pioneer, Benjamin Franklin, who flew a kite in a lighting storm and received a serious electrical shock. This proved that lighting was powered by the same force as carpets, but it also damaged Franklin's brain so severely that he started speaking only in incomprehensible maxims, such as "A penny saved is a penny earned." Eventually he had to be given a job running the post office.

After Franklin came a herd of Electrical Pioneers whose names have become part of our electrical terminology: Myron Volt, Mary Louise Amp, James Watt, Bob Transformer, etc. These pioneers conducted many important electrical experi- ments. For example, in 1780 Luigi Galvani discovered (this is the truth) that when he attached two different kinds of metal to the leg of a frog, an electrical current developed and the frog's leg kicked, even though it was no longer attached to the frog, which was dead anyway. Galvani's discovery led to enormous advances in the field of amphibian medicine. Today, skilled veterinary surgeons can take a frog that has been seriously injured or killed, implant pieces of metal in its muscles, and watch it hop back into the pond just like a normal frog, except for the fact that it sinks like a stone.

But the greatest Electrical Pioneer of them all was Thomas Edison, who was a brilliant inventor despite the fact that he had little formal education and lived in New Jersey. Edison's first major invention in 1877, was the phonograph, which could soon be found in thousands of American homes, where it basically sat until 1923, when the record was invented. But Edison's greatest achievement came in 1879, when he invented the electric company. Edison's design was a brilliant adaptation of the simple electrical circuit: The electric company sends electricity through a wire to a cus- tomer, then immediately gets the electricity back through another wire, then (this is the brilliant part) sends it right back to the customer again.

This means that an electric company can sell a customer the same batch of electricity thousands of times a day and never get caught, since very few customers take the time to examine their electricity closely. In fact the last year any new electricity was generated in the United States was 1937; the electric companies have been merely re-selling it ever since, which is why they have so much free time to apply for rate increases.

Today, thanks to men like Edison and Franklin, and frogs like Galvani's, we receive almost unlimited benefits from electricity. For example, in the past decade scientists developed the laser, an electronic appliance so powerful that it can vaporize a bulldozer 2,000 yards away, yet so precise that doctors can use it to perform delicate opera- tions to the human eyeball, provided they remember to change the power setting from "Vaporize Bulldozer" to "Delicate."

Yes, Flourescent tubes are used for noise sources. I have a waveguide noise source, that is a piece of waveguide with a Flourescent bulb in it! At school we had a the coaxial version made by the same company. It used a helical transmission line wrapped around a flourescent tube.

Admittantly, tho, the level of noise from the ionised gas is not that great, and probably does not pose any RFI/EMI problems for radio circuits. Altho, they can be a problem for RF labs. Some RF labs do not have Flouresent lighting. At Dayton, one of the test equipment makers had a Horn antenna, attached to his new microwave spectrum analyzer, and would show how it could pick up each flourescent fixture in the roof!

I m not too concerned about the gas noise myself. We can live with that. It s the stray radiation of spurious signals from the exciter electronics that could be a real problem!

Right.... if the cell phone antenna is 1 foot from the "repeater"
antenna, I get a loss of 21.3db. If the cell phone in question
is the usual sort of handheld with .6 watts output, the effect is
as if the antenna were directly connected to a transmitter with
6 mW output. Whether this does you any good is problematical
at best. It depends on how much signal gets out of the car using
the cell phone's own antenna. This depends on the geometry of
the car, the materials used in its construction, and where you
are sitting in the car. Overall, you would make out pretty well
in a rag-top convertable or a fiberglass car, probably not so
well in a conventional all-steel hardtop. I'd like to hear your
experiences with the repeater antenna, like whether it lets
you make calls from inside your car from areas where you
couldn't before.

3328. Re: Cellular repeater antenna vs wired - how different?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-11 16:06:22 UTC
From: srm@dimacs.rutgers.edu
Message-ID: <Jun.11.12.06.22.1992.2351@dimacs.rutgers.edu>
Source record: 288761

I recently posted a similar question. The response I received as a whole is that the Cellular repeater antenna shows no proven increase in reception for a handheld unit. That comes from a number of people including one which quoted an article on this and another that owns one.

Your best bet is to go with a wired setup. Hope this helps.

Source record: 288751

In article <2917262253-73445@dseg1>, Ocker@dseg1.CSc.ti.COM (Charlie Ocker) writes:
|>First of all, I want to thank all who responded to my recent request for
|>the ARRL emblem in Postscript format. The QSL card design is
|>progressing nicely, except for a small hitch. The person designing the
|>card is using a software package that will not accept Encapsulated
|>Postscript. It will accept the following:
|>
|> * Adobe Illustrator (EPS)
|>...
|>Charlie KD5PJ ocker@dseg1.csc.ti.com
|>Texas Instruments, Dallas

"EPS" means "Encapsulated PostScript" so that means it SHOULD accept the logo you got. Unless of course the software is so braindamaged it can only understand the precise EPS format created by AI and not any other form, even though conforming to the EPS rules.

If so, you might try feeding the logo to Illustrator, which certainly should accept it, and then have it produce another output file. Perhaps that would be acceptable to this program.

Another approach, if that doesn't work, is to replace it by a real program!

Hi,

I guess I should clarify the legal limit transmitter for $20. If one is resourceful enough, this can be done. Look for old tube type 250W and 1KW AM broadcast transmitters. Many commercial stations will give them away because it costs too much to remove them, let alone the cost to dispose of old PCB laden caps and such. IT CAN BE DONE! Some people have money to burn and they burn it. I can chuckle a little. Building rigs for peanuts is something I have had to do for years. If you look hard enough, beg, ask, trade, you can build a big rig for peanuts. It is the conventional thinking that is the problem. For an example, despite the fact that it is 'recommended' to do something a certain way like chimneys, it DOESN'T have to be exact. People have been running 4-400As for years with only a muffin fan. It is a bit more critical to get good air turbulence... but it can be done. Blowers-- I was recently at one of the largest hamfests in the Northeast, Rochester, NY, where towards about 5:00 pm, my friend and I were given 3 large blowers for ONE DOLLAR. This same friend built up a $1000 sattelite receiver from boards in a box that sold for a dollar. 4-400A transmitting tube PULLS have been going for $20 for a long time. A good size TV transformer can drive all your driver stages and the screens on Finals if you have screens.

Your biggest plus is your friends on the air, ask around, ask every-one. You don't need a fancy rack, just some sheetmetal and Aluminum angle iron. Go with tubes, they are cheap at hamfests and in some respects are easier to work with then solid-state. Economy, that's the name of the game. Keep it cheap!

Don't ever tell someone that they can't do it. It can be done. And are you guys crazy to pay money for an antenna tuner? Slap some coil stock and receiver air variables together. Receiver air variables can withstand high voltage when immersed in mineral oil.

Quite a few older homebrew radios can be had just by getting it out of the next door neighbors basement! If you don't care about the bells and whistles, radio gear can be made or bought for peanuts. You havent asked around enough, if you think it can't be done.

Message-ID: <1992Jun11.171809.21976@cbfsb.cb.att.com>
Source record: 288753

Its easy to charge the 470 battery from the car battery. All
you do is put a resistor in series with a battery feed (i.e. from the
cigarette lighter) that is appropriate for the battery size. I do it
with the FNB-17 battery which is 600 mah. Nicads like 1/10 of
the full charge capacity, in this case 60 ma. Use ur ohms law
to estimate the resistor size. (13.6 -7.2)v/.06 a would put you
in the ballpark. I used about 50 ohms and measured the current.
The only thing you must be cautious about is the time limit. Charge
it for no more than 14 hours at a time.
I didn't do it yet, but putting a diode in series with the resistor will
prevent the battery from discharging if there should be a short in the cable
or fom discharging back into the power supply if you are charging it
from a 12 vdc supply.

3333. Alinco DJ-580T

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-11 17:29:08 UTC
From: WEILAND@UPS.EDU
Message-ID: <920611102737.57b@UPS.EDU>
Source record: 288754

I recently purchased the Alinco DJ-580T HT.
So far, it has proven to be a good radio.

I modified it for Aircraft (AM) and for off-band operation for CAP and MARS.

I have a couple of concerns:
1) The plastic lens over the display is not at all protected, so is
subject to scratching. Is it readily available and easily replaced?

2) The numbers on my keypad are already fading away. The VHF and UHF
buttons are barely readible, the * button is unreadable, plus several
others are getting quite faint. The radio is 2 1/2 months old. I
would think that the keypad should remain readable longer than that.

Last week, I was in Oregon and had a QSO with a friend. Several times, he
remarked that my audio had disappeared. I was still able to hold the repeater
but had no audio. Has anyone else experienced this problem?

Thought I would throw this out for comment.

Larry

From: nfunamura%mis2.DEcnet@nuwes-lll.navy.mil
Message-ID: <9206111733.AA07284@ucsd.edu>
Source record: 288755

Pete Demmer, KH6CTQ passed along this hint to me. Hope this helps other netters.....

Rather than just discarding depleted 9 volt batteries, Pete saves them and recycles the connectors (top of the battery) for use on projects that require 9 volt connectors. The recycling procedure is very simple requiring just a side cutting plier to pry back the metallic housing holding down the connector. Push the battery out of the housing from the back end of the battery to recover the connector.
Pete also points out that six very useful 1.5 volt batteries are enclosed!!!!
Try it you'll be pleasantly surprised at what you find inside the housing.

NOTE: Standard precautions apply...safety glasses, unintended use etc. etc.

3336. Incentive Licensing

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-11 18:15:54 UTC
From: tonyp@convex.com
Message-ID: <1992Jun11.181554.22465@convex.com>
Source record: 288756

Well, I found the "R U sick of QRP in QST" thread so enlightening
that I've decided to post my 2nd belief - to see if I'm wrong, and
everyone likes it, or if they agree with me.

Many moons ago, back in the dim-time (pre-1968 or there abouts),
the amateur bands were of two shapes: "Novice", and "everyone else".

The Novices had their chunk, and Generals & up could operate there,
and the rest of the entire band. There were no class-subdivisions.

There was a General, an Advanced, and an Amateur Extra class of
license, but it didn't mean anything other than you've accomplished
taking a high set of tests.

Now somewhere along the line Incentive Licensing came along. I admit
that I don't know "how". The name says it all. There was now a reason
to go for the higher class of license: you got something tangible
in return.

I thought/think Incentive Licensing is unfair.

Once you've passed a set of tests that ensure:

o you have an idea of what you're doing
o you have an idea of international laws
o you won't cause interference
o you won't fry yourself

You should have the same privileges as someone who does
electronics for a living, or has a real knack for it.

After all, this is a hobby.

The incentive licensing did work for me, but from a difference
perspective: I didn't take the AE for more bells & whistles, I
took it so I wouldn't have to learn any new rules. I didn't want
to have to look at a chart to see where I was allowed, and where
I wasn't. Dang Hippie-radical is what I was back then - now I'm
just a Republican! :-)

In article Message-ID: <1992Jun10.185618.2441@news.larc.nasa.gov>,
kludge@grissom.larc.nasa.gov (Scott Dorsey) said:

"I'm all for making broadcast TV illegal, both UHF and VHF. Most people
have access to cable TV anyway, right? "

BZZZZTTTT: Wrong, Scott. Many do, perhaps a statistical majority, but
there is still a significant portion of the US population that don't have
access to cable TV.

Despite the fact that Lakes Region Cable (of Laconia, NH) has the exclusive
franchise to serve the town of Epsom, New Hampshire, and was obligated by
contractural terms dictated by Town Meeting (technically, our absolute form
of town government up here - the Board of Selectmen were *told* by the voters
in town how it was going to be...) to serve *ALL* parts of the town, they
refuse to run a cable up my road and refuse to connect me up.

So, I can't get HBO, CNN and the rest of the hoopla. Instead, I get no fewer
than 22 channels off of the air, including Public Television from 4 states. I
have a choice of at least two different stations for each of the 'Big 3'
commercial networks, which helps avoid the NFL Blackout Rule. (Not that the
Patriots are worth watching...).

I'd like to give 902-928 to DAB, and have them give us some virgin space
free from an artificially high noise floor induced by stupid consumer gadgets
that spread their crap all over our spectrum. I'd love to see 6m truly usable
in all areas of North America, not just out in the Boonies. I'd love to see
our hospitals each have their own frequency instead of all being stacked up
on the same frequency, distinguished only by a CTCSS tone, so that ambulances
could give them more than a moment's notice that they're coming in with a
critically ill patient. I'd love to have the Cambridge, Mass FD move their
high band, multi-kW repeater output (which simply repeats what's on their
800MHZ frequency) off of the same frequency used to dispatch 30 fire
departments covering several hundred square miles in central New Hampshire.

Yeah, you're right - maybe we ought to banish TV from below 3 GHz, and make
the current satellite downlink band at 3.7-4.2 GHz *officially* a DBS band
since that's what it is in actual practice now. RM petition time, perhaps??

The spectrum sausage squeeze isn't about to get better soon...

I recently posted a query for a list of undocumented Ft-470 functions. Several responses supplies many features. There is one functions I still would like to have - I wonder if anybody else knows how to reset ONE CHANNEL?

For example, taking a recent trip down the Oregon coast, I set several channels for repeaters during the trip. I can set the SKIP function, but, if I dial through the channels, channels (SKIP'd or not) still appear. The only solution to clean up unwanted channels is to do s SYSTEM RESET and re-program those channels I still want. Anyone know who to reset individual channels?

Thanks to all who responded to my initial request. -Rob

3341. LET'S TALK RADIO service changing hands.

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-11 19:06:25 UTC
From: flash@lopez.UUCP
Message-ID: <lEuBe-.Q3@lopez.UUCP>
Source record: 288684
Cross-posted to: rec.video.satellite,rec.radio.amateur.misc

The popular LET'S TALK RADIO audio service, heard on S3/21 @6.2 has been sold. Jim Bass of Syracuse has transfered all physical assetts of the service, as well as the name and the transponder space to a group of Radio Amateurs headed by Blair Alper of Chicago, who is on the board of the RAIN (Radio Amateur Information Network) service.

Jim told me he sold the service to allow him more time to pursue other TVRO interests, including bringing back his popular QSO AMATEUR RADIO show, which will be coming on the air soon on G6. The demands of doing a video show, as well as his other interests, including the time away from his family caused by running a full time audio channel singlehandedly were given as his reasons for accepting the offer of the new group.

Frank Collins, N6TAF will be program manager of the service, and programming will be divided between three origination points to provide both diversity in programming as well as allowing the participants to have lives of their own besides sitting in a studio 12 hours a day as Jim has done the past year.

Programming on the service will be increased, and most of the popular programs already in place will remain on the air. Jim also assured me that he is going to continue his low profit satellite equipment sales operation, the profits of which will be used to support the new video channel, which initially will be on the air twice a month with a schedule to be announced later.

This friday night, Jim and I will do a retrospective on the LTR service, and a look toward the future both for LTR and his new video channel. The program is scheduled to begin at 9PM eastern time on S3/21 6.2 audio. I hope you will take time to tune in and call our 800 number, if for no other reason than to wish Jim well in his new endeavours and also to lend support to the new owners of the service.

Frank Collins has discussed the new program schedule with me, and if they are able to get the shows lined up, it will be a very impressive service, and be in keeping with the LET'S TALK RADIO tradition of quality information. Friday Nights, in addition to the FRIDAY NIGHT LIVE call in show and SIGNALS, there will be new programs devoted to Shortwave and Broadcast listening, and Steve Coletti of CROSSBAND will be on with a new live show as part of the enhanced lineup.

Other amateur related programs are to be added, and a new service in the early evenings (before the normal 9PM startup time) will be programmed by patients at various veterans hospitals around the country as part of a new service for disabled vets.

All in all I think these moves will be good for all concerned, and I hope the TVRO community will lend its support during the transition and startup of the new LET'S TALK RADIO and QSO AMATEUR RADIO TV show.

With the exception of my novice Heathkit transmitter (purchased in 1963 for $50), I have never bought a new major piece of ham gear (e.g. transceivers). I bought a TR-3 in 1968 which was about 5 years old at the time and used it for over 10 years. Then I bought a TS-820S in 1981, again about 5 years old. And most recently I have a "brand new" (to me) TS-430S and gee, Dad, I can get on the WARC bands now, only 10 years after they first became available!

In each case I paid between $300 and $500, I've had no problems with any of the rigs, and I've got all the features I seem to need.

This doesn't work if you *have* to have the latest widgets, but I'm a pretty serious DXer and I do just fine without a TS-950DXATGT or whatever the latest is!

Call me cheap? Or practical?

Cable has cut severely into the broadcast audience in metroplexes and
broadcasters have not been aggressive in their counterattacks. Instead
they have attempted to fight a losing rearguard action. That's too bad
for those of us living in rural areas and for the concept of free universal
broadcasting service. Sadly, the days of universal free TV are numbered.
The marketplace has spoken in the metroplexes and pay per view fragmented
audiences are becoming the norm. This has profound cultural implications.
No longer do the majority of Americans have a base of shared experience
with their fellows. The melting pot of popular culture has fragmented.

While pay cable will dominate the metroplex of the future, new scrambled
MDS services are being proposed for the rural areas so that everyone
will have to pay to receive a video program. These MDS providers are
looking hungrily for spectrum, especially amateur allocations.

Meanwhile, UHF broadcasting has already lost channels 70 through 83
to cellular phone and trunked radio. Channels 14 through 17 are gone
in some areas, taken for government communications, mainly police.
The lower VHF broadcast channels have not faced much spectrum pressure
in recent years. Their longer range and larger antennas have made
them less attractive to potential spectrum grabbers. Only over the
air broadcasting requires the range and spectrum provided at VHF.

>Gary is a lot more knowledgable about this than I am, I am sure, but
>it seems to me that there was a proposed phase-out of VHF television
>broadcasting (channels 2 - 13) once upon a time. As I remember, there
>was a lot of discussion about this, and after a certain year, all TV
>receivers had to have UHF receive capability. The VHF TV stations
>supposedly would get their UHF channel assignment, fire up and simulcast
>for some period of time, then shut down the VHF transmitter for good.
>Eventually, all of the VHF space that became free would be used for
>public service communications and other things. So then, channels 14
>through 83 would have been available for TV broadcasting. It would
>not surprise me if some special interest groups got this plan tabled
>or scrapped somehow, and things just kept going, except that now all

>the TVs had UHF as well as VHF capability. But just consider the
>fewer TVI problems we would have had if VHF TV had been phased out.
>Maybe it is not too late.

The reason for the requirement for all receivers to have UHF capability
was to give the UHF broadcasters as even a playing field as possible
with the VHF broadcasters. This was pushed mainly by the Association
of Maximum Service Telecasters, a UHF broadcast trade group. The problen
was that the receiver technology of the day made achieving stability
and good SNR at UHF much harder than at VHF. This gave the VHF broadcaster
an additional edge over the UHF competition. Of course, the other range
limiting problems of terrain blockage and increasing signal loss at UHF
remained and the FCC allowed UHF broadcasters to run 5 million watts
instead of the 116 thousand watts of a low VHF broadcaster to compensate.
To this day, the power bills of UHF broadcasters remain a dominant expense
in operating their stations.

It should be kept firmly in mind that it was public policy to maximize
the coverage of broadcast facilities. This was in line with the concept
of universal service also then expoused for the telephone company. This
is a social policy rather than a technical issue. Broadcasting, particularly
TV broadcasting, was seen as a powerful force for developing a common
popular culture, a vigorous heating of the melting pot of society. This
was directly in line with other government actions such as school integration
and public accomodations integration.

These policies have largely been failures of course. The real results
have been white flight, the politics of envy, and the rise of fragmented
popular culture. TV broadcasting was the only one of the policies that
appeared to be working. TV broadcasting developed a national consciousness
unique in history, but the rise of cable allowed that constituency too to
fragment into tight little special interest cliques.

Broadcasters too, contributed to their own downfall. By catering to the
lowest common denominator, their programing was designed to not offend
anyone, but it also did not inspire, uplift, or titilate anyone. With
the rise of cable, narrow special interest programing, guarranteed to
offend some segment of the audience, became profitable. So now you have
all religious channels, the Playboy channel, all sports channels, R rated
movie channels, etc. Common cultural experiences have again become rare.

As broadcasting becomes more and more an anachronism in the face of the
fragmented special interest audiences, I expect more and more broadcast
facilities to go dark. I once thought I'd never see the day when a major
broadcast outlet would close it's doors. Broadcast seemed a license to
print money. But no more, even the mighty national networks have fallen
on hard times and are unlikely to recover. I fully expect that half the
broadcast facilities in the nation will go under in the next 10 years.
This is the passing of an era in mass communications.

You can't be an auxillary/remote-control station while on the same
property the station you are controlling is licensed to. If it's within
your reach within seconds, it's 'under-your-control' even if keyed by
your talkie so don't sweat it.

Help! I'm trying to recall who phoned last week and
said "I'll be there, plus one more" for the USENET
dinner get-together at the California Railroad Festival.

I forgot to record this person'sname & email address,
and no longer remember who among a platoon of people
that I've spoken to this was. If you're this missing
person, would you please contact me fairly quickly?

In case there isn't an opportunity to get a message back
to me, the plan is to meet around 5:15 p.m. in front of the
Overfair 1915 in the Railroad Museum lobby. We have a
reservation for 5:45 in my name at Fat City (1001 Front Street,
just across the street from the Central Pacific Passenger Station,
Freight Station, and the Delta King.

3349. Upgrading from General to Extra

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-11 22:39:59 UTC
From: ad815@yfn.ysu.edu
Message-ID: <1992Jun11.223959.3603@news.ysu.edu>
Source record: 288768

First of all, thank you all very much for all the responses to my original message -- although I must admit that some of y'all contradicted each other <<Grin>>

Probably the most interesting response was from Bob Innerbitzen (sp?) at the ARRL/VEC office who said, "Your paperwork is fine and you'll be getting your Extra ticket as soon as everything is processed and sent to the FCC," or something to that effect.

I did recieve a single CSCE at the exam session which indicates that I upgraded to Extra.

The most likely explanation for what happened (according to several individuals) was that the VE's spotted the copy of the General license along with the information that I had passed everything up to Extra and they just assumed that I had an Advanced upgrade pending from a previous session.

Apparently what happened was that they photocopied page 75 of the ARRL/VEC Volunteer Examiner Manual, filled it out, put the name of one of the VE's on it, informing me to call if I had any questions, and then sent it to me. Upon calling that VE from the 5/30/92 Highland Heights, KY exam session, he told me that the upgrade would happen in two steps, which the gentleman from the ARRL/VEC office tells me is not correct, that my paperwork will be sent in as it stands.

Yes, I got the ARRL/VEC VE Manual. I left a message on the ARRL/VEC WATS answering machine and a young lady from the ARRL/VEC office called and said to wait until my Extra license arrives and then photocopy it and send it along with the VE application materials (this is where I spotted the form).

Okay ... moral of the story ... all you VE's out there ... be advised (and tell all the other VE's you speak to) that a photocopy of page 75 is unnecessary in the event of upgrading by more than one license class in a single test session in order to avoid inciting a panic like the one I almost had! <<Grin>>

Thanks for all the replies!

>coupling quickly decreases to zero.)
>
> -- 73 de Chris Thomas, AA6SQ (ex-WA6HTJ) (CSMSCST@MVS.OAC.UCLA.EDU)
Basic transmission loss between dipoles:

```
Lb=10 log (4 pi d)**2
-----------
lambda**2 (3.28)
```

Assuming 5 feet from the portable antenna to the repeater antenna the coupling loss would be:

```
Lb=10 log (4 pi 5)**2 = 30.8 dB! at 800 MHz
----------
1**2 (3.28)
```

The 800 MHz gain antenna gain makes up 3 dB leaving us still 27.8 dB in the hole.

3352. Is this another Alinco DR-590t Problem?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 00:34:29 UTC
From: sche0459@hgc.edu
Message-ID: <1992Jun12.003429.26069@merlin.hgc.edu>
Source record: 288686

A few weeks ago I received my upgraded Alinco DR-590T. When transmitting with DSQ, the mic audio is muted while the tones are being sent. Fine.

However, when crossbanding, the VHF audio is simultaneously transmitted with the DSQ tones over to UHF. If somebody on VHF is pretty loud, then the HTs fail to properly decode the DSQ tones sent from the 590.

DSQ on the 590 UHF side is necessary for remote control operation. Also, both an Alinco DJ-560 and an Icom W2A fail to open squelch occasionally, which leaves me frantically pushing the monitor (squelch disable) button on the HT.

Does anyone else have this problem? Does anyone know which pots adjust DSQ tone level?

Note: A quick way to see if your radio does this is to crossband a dead VHF simplex channel to UHF with DSQ enabled on the UHF side. Open the squelch on the VHF side. After the 590 sends the tones, does your HT open its DSQ?

Thanks,
Bill

Source record: 288678

My 7 year old daughter and I have an agreement that I now need to fulfill my end of the bargain on! She can now read quite well and really wants to become a ham!

I'm stuck as to where I start. I'm looking for any and all tips/techniques that I can use to teach my daughter what she needs to know. Especially helpful would be books/software that others have used, learning tips/tricks for someone this age and also- what kind of testing is done for a 7 year old?

Please reply to me via mail. The site I am on is critically short of disk and news purges out faster than I can keep up. I will post a summary if there is sufficent interest!

Thanks in advance for any and all help

!

To be really really picky, the DOC requires you to have the Basic
before you can do any operation at all. In other words, you could
have the Advanced+12 WPM and still not be granted a certificate
until you write the Basic.

Why are we discussing Canadian licensing with a Distribution: usa?

Message-ID: <oler.708313495@honte>
Source record: 288709
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 01:00 UT, 12 JUNE

/\

VALID UNTIL: 18:00 UTC ON 12 JUNE

MODERATE RISK PERIOD: 12 June (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: LOW - MODERATE

POTENTIAL LUNAR INTERFERENCE: MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

NORTHERN WASHINGTON STATE / SOUTHERN BRITISH COLUMBIA TO NORTHERN
IDAHO TO CENTRAL MONTANA TO SOUTHERN NORTH DAKOTA TO CENTRAL
MINNESOTA TO CENTRAL WISCONSIN TO MICHIGAN TO NORTHERN NEW YORK STATE
TO NEW HAMPSHIRE TO SOUTHERN MAINE.

SYNOPSIS...

Auroral activity has increased to moderate levels over the northerly
middle latitude regions, with sporadic bursts of high-intensity activity
over the high latitude regions. This activity appears to be in response
to a favorable minor solar flare which erupted on 08 June. The initial
phase of the disturbance suggests levels of auroral activity may
occasionally become luminous enough to be seen over a larger area of
middle latitude regions. The northern tier of the U.S. states and all
of the Canadian provinces are the anticipated primary sites for
observing low to moderate levels of activity over the next 24 hours.

Some stabilization is expected to occur later this UT day (12 June),
limiting the visibility of activity to the higher latitude regions.

This is not expected to be a significant disturbance.

This watch will remain active until 18Z on 12 June when it will either
be extended or allowed to expire.

** End of Watch **

J. S. KENNEDY AT AXINAR SAYS:
>that said basically, "The form 610 you completed for this test session
>is being held at the ARRL/VEC office pending the receipt of a photocopy
>of your pending license upgrade."

The way it's worded, he went from General to Extra in
ONE SITTING. If that;s the case, someone at the testing ARRL/VEC group
has their wires crossed. Suggest he call the ARRL/VEC
hotline at 800-927-7583 and talk to Sue Corliss about it.

If you had gone from General to Extra in two different
test sessions that were mailed separately to the ARRL/VEC
then you would have had to wait. Reason being that <quote>
the FCC does not want two separate applications for action
in the licensing unit at the same time <unquote>. (If that's
so, why is their a question on the 610 about pending applications??)

3363. Motorola Radius P10 question

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 04:11:34 UTC
From: thompson@cactus.org
Message-ID: <1992Jun12.041134.16187@cactus.org>
Source record: 288681

I bought a Motorola Radius P10 the other day. It has overload problems
with a pager on 152.480 MHz. The P10 is on 151.625MHz. Could this
be an image rejection problem at the 2nd i.f.? I have a Regency Utilicom
radio on 151.625 which costs less and has zero problems with overload
due to the pager on 152.480. The Motorola Radius is a nice little talkie
but its performance is inferior to the clunky Regency Utilicom.

Anybody know what the 2nd i.f. frequency in the P10 happens to be???
Any solutions floating around out there?

thanks in advance,

-c.t.

Ditto, Ditto - What he said!!!

Anyone that wants to get a taste of weak signal check out 144.200 +/- 50khz
this weekend (SSB of course). There is a contest this weakend starting in
the afternoon on Saturday. We're a zealous bunch. You will feel like a
rare country.

>+---------------+
```

>Any ideas?

The NTN-5447-B is the part number for a Motorola battery for
the MT-1000 radio, which if I recall correctly is a UHF rather
than an 800 MHZ radio. Unless the same battery fits other models
also...

The best way to find out what frequencies the radio is operating on
would be to take it to a Motorola service shop and ask them to read
the information from the radio.. Even then, assuming it was a trunked
radio, they would only be able to get 4 freqs for you, those of the
data channels, as they are the only ones in the radio. They tell the
radio what freqs to receive on the fly as needed..

Gary,

Thanks, I knew everybody would be interested in that piece of trivia.

Due to the foresight of the ATV'ers in Mpls years ago, the following
solution was created (even if by accident) to solve this problem.

Our ATV repeater in Mpls has an output at 421.25mhz with VSB filtering
so that we stay above 420mhz. Input to the repeater is 439.25mhz which
is also our simplex freq. This leaves most of the area between the two
open for the other services with negligible interference. This is not
just theory, it actually works and we all live in harmony.

3369. Questions about radio in general

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 07:32:13 UTC
From: sl9b4@cc.usu.edu
Message-ID: <1992Jun12.013213.56550@cc.usu.edu>
Source record: 288682

Hello,

This question is about radio transmissions in general, not just about Hams. Sorry if this is really inappropriate, but I know some of the readers here know about more than just Ham.

I'm writing some fiction and I need background information about how different radio types transmit. First, what are the frequency ranges, modulation types and typical transmitting powers for:

Ham radio (the typical set up, nothing really decked-out)?

Military radio (the type usually used in the field -- PRC or VRC series)?

Police radio (again, typically)?

Commercial ``walkie talkies?''

Second, can radios with different modulation types communicate? Can a radio that uses FM transmit to an AM set if both sets are on the same frequency? Can that even happen -- can an AM set and an FM set even be on the same freq?

Post if you want, but e-mail might be better, I may not be back in here for a while. This may sound like a crash course in radio, but it would really be helpful. If you know of a good non-jargon reference to find some of this stuff, please send that too. Thanks in advance.

I think the packages are like Microsoft Word for windows and CorelDraw! both of these refused to take in the EPS file when I tried it. Word does not appear to have a postscript filter though it does a couple of *.EPS formats.

> "meat" theory of auto pricing.

Gary,

Inflation shouldn't be a factor, since it would affect meat prices as well
as car prices.

I don't think federal standards really have had much to do with it. In
these days of much higher fuel prices, customers demand more fuel-efficient
cars. One way to increase fuel economy is to haul less car around.

Hence, cars are made from lighter materials, but cost roughly the same
(on the "meat" adjusted scale) as similarly-equipped cars of yore.

So, while cars may cost more per pound than hamburger today, it has more
do to with the weight of the autos than the price.

Maybe he had a talk with his lawyer. Broadcasters aren't allowed to have PCB filled components in their plants anymore. Same problem with pole pigs, the power companies have to account for each one to the EPA and have paperwork from a certified hazardous waste facility to prove that they were disposed of properly. The PCB thing is drying up supplies of transformers and old broadcast transmitters. Our plant just went through the process of replacing all the PCB filled capacitors with new ones. It took a half an inch of paperwork to get rid of the old ones.

This works good. I've modified RS cordless phones for six and two. You can convince them to work duplex on a repeater split. If you boost the power too much though, it desenses itself.

Only one little thing wrong with this scheme. If everyone buys
ten year old rigs, where are the new rigs coming from that we
will be buying ten years from now? Be happy somebody is buying
new rigs. I also applaud your determination. Anyone who would
use a TR-3 for ten years is a glutton for punishment. A TR-4
now, that's a different story. :-)

The ARRL pushed it, and what you got in return was the *same* voice
privledges that you had previously *returned* to you after passing
another Morse test. Lot's of people didn't like it then, and lots
still remember. Though some claim it was coincidence, I think not,
amateur radio growth stopped when incentive licensing came in and all
the then American equipment manufacturers went out of the ham business
within a few years (except Collins, but they dried up rather quickly
afterwards).

Over the years, the FCC has relaxed requirements, expanded the Advanced
Class privledges, and finally created the new codeless Tech class. The
high speed Morse license doesn't mean much anymore, except for VE purposes.
And surprise, growth is starting again. Coincidence? I think not.

>I thought/think Incentive Licensing is unfair.

>
>You should have the same privileges as someone who does
>electronics for a living, or has a real knack for it.
>
>After all, this is a hobby.

I don't think incentive licensing was fair to hams licensed pre-68,
and I think it was responsible for two decades of stagnation in amateur
radio. I also think that the archaic Morse exam still counts for too large

a share of the licensing requirements. However, multiple classes do ease the jump from the beginner classes to the do everything class. When there were only two classes, Novice and General, the step was a long one and many fell by the wayside.

I do believe in the concepts of life long learning and learning by doing. I don't think government tests beyond the regulatory and safety issues you mention are strictly necessary. People naturally learn what they need to know to do what they want to do. Fortunately, except for DXers, there's little need for anyone to bother with any of the exams beyond Technician if they are in amateur radio to learn and experiment.

Gary KE4ZV

3375. ICOM 271/471 Serial Data Interface Problem.

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 13:47:30 UTC
From: Rmcellig%msrd@redstone-emh2.army.mil
Message-ID: <9206121346.AA11296@ucsd.edu>
Source record: 288687

I am seeking help and assistance from anyone using the ICOM 271/471
combination, with simultaneous use of the ICOM CT-16 Satellite Interface Unit
and the serial outputs from the Kansas City tracker/Tuner.

SITUATION:

For the passed several years I have been successfully using the IC271/471
combination, equipped with the UX-14 serial adapters and the CT-16 interface
unit for the frequency tracking on AO-10, AO-13, FO-20 and etc.. I also have
the KC Tracker/Tuner. I would like to use the serial outputs from the
KC Tuner to control the frequency for Doppler shifts when using the Pacsats.
For pacsat operations, I am using the Paccom PSK-1, and TNC-NB9600 combo.
I have modified both radios for 9600 baud operations, and applied N6KK's
KC tuner modifications to the KC Tracker/Tuner circuit board assy. I would
like to be able to use the serial inputs of both the IC 271/471 for normal
operations with the CT-16, AND piggy back the Port A & B outputs from the
Kansas City tuner for pacsat operations doppler shift tuning.

PROBLEM:

The problem is with the switch setting of Dip Switch 3 on S1 of the UX-14
converter board. SW1-3 controls the Transceive operations:

S1-3--ON Activates transceive operations. Data are sent out when each
parameter is changed.

S1-3--OFF For independent control using a personal computer. Data are sent
out when commands are received.

Dip switch 3 on S1 must be OFF when using the CT-16 interface.
Dip switch 3 on S1 must be ON when using the KC Tuner.

POSSIBLE SOLUTION:

I see only two posssible solutions to this problem.

a. Forget about trying to use the serial outputs from the KC Tuner,
and just use the mic-click routine, thus making no change to the
UX-14/CT-16 operations.
b. Or install an external switch via the "Accessary Jack", and
externally switch the S1-3 dip switch to correspond with the type
of operations I am using.

I called Brooks Van Pelt of L.L. Grace about this, but to no avail.
I am sure that there are many ICOM 271/471 users reading this, and I hope one
of you has accomplished this task. Many thanks for your help.

Oops.. I was a bit unclear on that. I'm trying to use the built-in
charger of the W2e or the BA-20 (which is a separate unit with the same
circuitry on it)

I think the built-in charger can provide enough current to charge the
cells according to the "14 hours 0.1 C" rule. The NiMH cells have a
capacity of 1000mAH - which is the same as the NiCd pack that comes with
the American version, the W2A.

As I said, there are some components in the battary pack that program
the charge circuit with what current the pack should be charged. However,
I was unable to alter the circuit to make the W2e charge the pack as if
it were a 1000 mAH circuit - hence my question.

>Specs for the batteries I have suggest 360 mA for 4-5 hours
>or 1.3 Amps for 1.0-1.2 hours (dangerous). Trikle charge is
>60mA.
>
>My suggestion is -- get a real battery charger. Good
>guideline is to charge the AA as if they were C cells.
>
>I use a Radio Shack "Quick Charger" (5.5 hrs) and
>slightly tilt the cells so the AA cells make contact
>with the C terminal contact points. Works great.
>RS Quick Charge on C cells is approx 234 mA. Watch
>the time.

Thanks for the hint, but I am a forgetful person (and cheap too)
so I wanted to try to use the W2e here, which should do the trick too.

Waiting 14 hours is not too bad - after all, the rig comes with a
600 mAH pack and a person has to sleep too, so I can wait 14 hours.

Good luck Dave. I tried with my 8 year old last year. I was helping to teach a Novice class at the time. I had an interesting experience that was unexpected.

>I'm stuck as to where I start. I'm looking for any and all tips/techniques
>that I can use to teach my daughter what she needs to know. Especially
>helpful would be books/software that others have used, learning tips/tricks
>for someone this age and also- what kind of testing is done for a 7 year old?

I started with the code. I wrote out the letters on a piece of paper and she looked them over. Within a day she had memorized 1/2 the alphabet! A week later she had not looked at it again but still remembered those letters. At bedtime, before her story, I would send her a small message for practice. I was really amazed at how easily she picked up the code and retained it.

The theory was another problem. She did not have the mathematical background for even the simplest numerical problems. Memorizing the rules was not as bad but she lost interest in that part of the exam. She still loves code however.

My advice is to teach the code - kids seem to have an affinity for that kind of thing, especially when you make it a game such as sending secrets that her younger sister and brother (or even her mother) could not understand. I have not solved the problem of making the written part of the test fun. Now that she is 9 and has finished 3rd grade she is much better prepared to do some calculating. I'm going to try again this summer.

John,

That is a fringe UHF tv antenna. So all of your assumptions are
correct if applied to the UHF tv band.

Steve, KA0VYB

3380. My List of Mail Order Electronics Companies

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 16:37:07 UTC
From: jfw@ksr.com
Message-ID: <12936@ksr.com>
Source record: 288698
Cross-posted to: sci.electronics,rec.radio.amateur.misc

[$Revision: 2.9 $; last updated 12 June 1992]

Here is my list of companies which will sell electronic components in small quantities. Most of these places I have bought from, a couple I haven't. Being a ham radio operator, I am most interested in RF components, and in particular, air variable capacitors, which tend to be scarce (and tend to be used or surplus even if I've otherwise labelled the seller as "NEW"). I apologize in advance for disparaging remarks about what happens when parts suppliers start selling computers, but anyone who has watched Jameco over the years will know just what I mean (though their latest catalog hints at possibly returning to selling parts).

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment. Ideal for stocking the junkbox, usually have dependable stock lines of resistors, capacitors, and some semiconductors, but won't have those LCD modules forever... An invaluable resource, don't shy away from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality, I suppose. Intended to honor one or two ham spare-bedroom operations.
PUBLICATIONS Two publications which are essentially all want-ads, plus the address for SAMS PHOTOFACTS because everyone always asks about it on sci.electronics.

Note on shipping costs: I don't always update these frequently enough, and they're generally for continental US unless otherwise mentioned.

NEW COMPONENTS:

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
(800)-866-6626 (orders)
(401)-596-3080
(401)-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils.

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.

Pelham NH 03076 Pelham NH 03076
(603) 635-2235
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. Send $1 for the catalog.

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
(800) 528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20). When ordering, you may want to be sure to ask about availability and shipping locations; they have several warehouses, and frequently orders will get sent from several warehouses (which drives up the shipping costs).

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
1-800-DIGI-KEY
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602N), but they do have blue LEDs.

Active Electronics
11 Cummings Park
Woburn MA 01801
(800)-677-8899 (US)
(800)-363-6592 (Canada)
$25 minimum, $5 S&H UPS, free catalog. They have 8 stores in the US (Santa Clara CA; Chicago IL; Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 9 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Edmonton; Vancouver BC). Lots of stuff, oriented more toward supplying last-minute requirements of companies than hobbyists, but perfectly happy to take your money in small doses (stores have no minimum order). Some items in their catalog are subject to a $25 per ITEM minimum and are only stocked in regional warehouses, giving both mail and walk-in customers the worst of

both worlds.

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
(312) 784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1248 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets.

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division
1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
(800) 93-ARROW
Minimum $25; they no longer have a catalog. They are a Real Distributor, but also didn't mind my placing a personal order (a couple of years ago).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
(800) 543-4330
Minimum $20 ($25 for charge cards, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Hauppauge NY 11788-5134
(800)695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
(800) 831-4242
(800) 237-6948 (FAX)
(415) 592-8097
$30 minimum order (was $50), >$5 shipping & handling. Their most recent catalog may have reversed a long trend of abandoning parts in favor of

PC compatibles, or it may not; one can always hope.

JDR Microdevices
2233 Branham Lane
San Jose CA 95124
Orders: 800-538-5000
Cust. Service: 800-538-5001
No minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components; indeed, they recently dropped their minimum order requirement entirely.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
(408)257-8614 (408)996-3240
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
(800) 423-0070 (orders)
(602) 945-7736 (stock/price checks)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling. Wide array of ICs, good assortment of electronic components.

EasyTech Inc
2917 Bayview Drive
Fremont CA 94538-9932
(800) 582-4044 (orders)
(510) 770-2345 (customer Service)
Apparently a brand new company, "dedicated to serving the Electronic Enthusiast/User." $10 minimum, UPS shipping is 5% of order (>= $3).

International Components Corporation
1803 NW Lincoln Way
Toledo OR 97391-1014
(800)325-0101 (US & Canada)
(503) 336-4400 (FAX)
Cabinets&Enclosures; Capacitors; Diodes; ICs; Potentiometers; Resistors; Sockets; Transistors; Books. No minimum order, $2 handling under $25.

Kelvin Electronics
7 Fairchild Ave.
Plainview NY 11803
(800) 645-9212
(516) 349-7620
(516) 349-7830 (FAX)
Minimum order $20; S&H 5% of order ($5 minimum, extra for large stuff, overnight, export (like to Hawaii :-), and etchant; based on UPS charges). Lots of electronic parts & tools, some robotics supplies, model rockets.

H & R Company (Herbach and Rademan)
18 Canal Street, P.O.Box 122
Bristol PA 19007-0122
(800) 848-8001 (Orders)
(215) 788-5583
(215) 788-9577 (FAX)
Minimum order $25 ($5 processing charge under $25), shipping $4.75 under $30;
Most items are new overstocks, much regularly stocked stuff as well. Tools,
electrical supplies, motors, mechanical components, robotic components.

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567
Van Nuys CA 91408-0567
(800) 826-5432
$10 minimum, $3.50 S&H. New and surplus electronics.

Alltronics
2300 Zanker Road
San Jose CA 95131
(408) 943-9773
(408) 943-9776 FAX
Surplus electronics. $12 minimum, shipping per UPS.

American Science and Surplus (formerly JerryCo)
601 Linden Place
Evanston IL 60202
(708) 475-8440
Surplus. *The* surplus place. Lots and lots of surplus. WWII gun cameras,
velcro, laser disk chassis, 6 volt VW wipers motors, LEDs, rubber brains,
you name it, they've had it. Catalogs are a really good time.
$12.50 minimum order (which includes the $4 shipping charge).

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
(214) 343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30,
$2.90 shipping (extra for Alaska & Hawaii). Surplus electronics, pretty
random looking assortment.

Fair Radio Sales
P. O. Box 1105
1016 E Eureka St.
Lima OH 45802
(419) 227-6573
Surplus electronics. Heavy on parts for old Collins gear.

Hosfelt Electronics
2700 Sunset Blvd.
Steubenville OH 43952
(800) 524-6464

No minimum, $3.75 S&H. Surplus electronics.

HSC Electronic Supply (Halted Specialties Co.)
3500 Ryder Street
Santa Clara, CA 95051
(800) 4-HALTED Orders only
(408) 732-1573 inside California and outside US
Surplus (new) electronics; new and used test equipment. Minimum order $10
($2 handling charge under $20), plus UPS shipping cost. Has three stores,
of which 3500 Ryder Street is one.

Marlin P. Jones & Assoc.
P.O. Box 12685
Lake Park FL 33403-0685
(407) 848-8236
No minimum ($1 fee for under $10), shipping per UPS. Surplus electronics.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
orders: (800) 642-1123 (tues - fri 9am-4pm sat. 9am-3pm EST)
info: (216) 621-1121
$10 minimum. Surplus electronics.
"Also known to stock many components, but this is not discussed in the catalog.
Local store, a cleveland institution, is called Electronic Surplus, Inc., and
has been there since '48. Third generation now runs it." -- wb8foz

Surplus Sales of Nebraska
1315 Jones Street
Omaha, Nebraska 68102
(402) 346-4750
(402) 346-2939 (FAX)
New and surplus radio electronics. Wide selection: air variables.
Catalog $3 (free with order, refundable with $25 catalog purchase).

Tucker Surplus Store
1717 Reserve St.
Garland TX 75042
(800) 527-4642 extension 135
Surplus electronic gear; oscilloscopes and signal generators from the days
when dinosaurs with vacuum tubes roamed the earth (some solid state gear, but
all well used). Prices seem relatively high, and you'll be shocked to learn
how much it costs to ship a 75 pound oscilloscope by motor freight...
[Steve Brown, N8HFI:
In defense of Tucker, the have a broad selection, repair facilities, and
they certify the used equipment to meet the original specification and
warranty it for 90 days. Not every source does this:]

Davilyn Corp.
13406 Saticoy St.
North Hollywood, CA 91605-3475
1-800-235-6222 (Ex. CA)

1-818-787-3334 (CA)
1-818-787-4732 (FAX)
Surplus electronic gear.
[has much better prices [than Tucker], but sells used equipment as-is. -N8HFI]

SPECIALTY COMPONENTS:

JAN Crystals
2341 Crystal Drive
P.O. Box 06017
Fort Myers FL 33906-6017
(800) JAN-XTAL (Monday through Thursday)
They make crystals. Minimum order is $10, which might be one crystal, or might be two.

Crystek Corporation
2351/2371 Crystal Drive
P.O. Box 06135
Fort Myers FL 33906-6135
(800) 237-3061 (M-F)
They make crystals too. They were the cheapest last time I ordered, but I don't have an up-to-date price list. It took about 4 weeks, and they had said it would take 6.

ICM (International Crystal Manufacturing Co., Inc.)
701 W. Sheridan
PO Box 26330
Oklahoma City OK 73126-0330
(800) 426-9825
More crystals. They were more expensive, but they have lots of pre-made crystals for various rigs, so they would probably be faster.

Amidon Associates
2216 East Gladwick Street
Dominiguez Hills, CA 90220
(213) 763-5770
(213) 763-2250 (FAX)
Toroid cores and related things. Very fast service. Now takes MC/Visa and phone orders.

Palomar Engineers
Box 455
Escondido CA 92033
(619) 747-3343
Toroid cores and shielding beads.

K2AW's Silicon Alley
175 Friends Lane
Westbury NY 11590
516-334-7024
Free catalog, $10 minimum order. Semiconductors, in particular high-voltage diodes.

Small Parts, Inc. [New address and phone, 23 Dec 91]
13980 NW 58th Court
P.O. Box 4650
Miami Lakes, FL 33014-0650
(305) 557-8222 Order department
(305) 557-7955 Customer Service (ask for Mirta)
(305) 558-1255 Catalog (ask for Elizabeth)
(305) 557-8004 Custom-made Parts (ask for Ziggy)
(305) 557-8005 Non-standard Sizes
of catalog parts (ask for Eric)
(800) 423-9009 Toll free FAX line
$12 minimum. Mechanical parts, metal stock, Teflon(R) sheets, tools,
wire-size drill bits (as in #61 size for PC board holes).

KITS:
(The terse "Note:" descriptions are from the ARRL Kit List courteously
supplied by Ed Hare and Mike Gruber at the ARRL.)

624 Kits
171 Springlake Drive
Spartanburg SC 29302
QRP kits (including some designs from W1FB's books) and some parts.

A&A Engineering
2521 W. LaPalma, Unit K
Anaheim CA 92801
(714) 952-2114
Kits, some components, some books. S&H $4.50, catalog is free with SASE (2 oz
postage).

Antique Electronic Supply
6221 S. Maple Ave.
Tempe, AZ 85283
(602) 820-5411
Note: Broadcast receiver kits

Circuit Board Specialists
P. O. Box 951
Pueblo CO 81002
(303) 542-4525
As the name implies, they specialize in circuit boards; they have circuit
boards for a variety of QST articles and ARRL Handbook construction articles.
They also have partial kits for most of their boards. The catalog is free,
but I had to request it a couple of times.

C.M. Howes Communications
Eydon, Daventry,
Northants NN11 6PT
England
Phone: +44 327 60178
Note: QRP, transmitters, receivers, misc.

Communications Concepts Inc.
121 Brown Street
Dayton, Ohio 45402
(513) 220-9677
kits for Motorola Applications Notes (amplifiers and the like), small assortment of components (chip capacitors, transistors).

Down East Microwave
Box 2310, RR#1
Troy, ME 04987
(207) 948-3741
Note: Microwave preamps

FAR Circuits
18N640 Field Court
Dundee IL 60118
Printed circuit boards for articles in the usual ham magazines. SASE for list. $1.50 shipping and handling per four boards.

Hamtronics, Inc.
65 Moul Road
Hilton, NY 14468-9535
(716) 392-9430
Note: Amateur, general interest

Lake Electronics
7 Middleton Close
Nuthall
Nottingham NG16 1BX
England
Note: Amateur

Mercury Systems
15 Lakeside Dr.
Marlton, NJ 08053
1-609-596-3304
Note: the ARRL Kit list didn't say what they carry; I don't (yet) know either.

Penntek Electronics
14 Peace Dr.
Lewistown, PA 17044
(717) 248-2507
Note: The Neophyte Receiver, QST

Ramsey Electronics
793 Canning Parkway
Victor NY 14564
(716) 924-4560
Amateur radio and hobby kits. The ham kits are all pretty simple and pretty inexpensive, and you get about what you pay for. Their new VHF transceiver kits (144, 220, 440) look pretty interesting. Many have complained about the quality of their kits, though.

{See also RadioKit, Oak Hills Research}

LITTLE GUYS:

Oak Hills Research
20879 Madison St.
Big Rapids, MI 49307
Send $1 for a flyer. Some parts, QST article kits, transceiver kits,
QRP stuff in general (they inherited the stock from Small Parts Center
when they closed).

KA7QJY Components
Danny Stevig
Box 3893
Logan UT 84321
(801) 753 5961
Send a business-size SASE for a current list of parts. RF parts, including
vernier drives and air variables. $2.75 shipping, no minimum. Fast service,
lots of satisfied customers.

R&R Associates
3106 Glendon Avenue
Los Angeles, CA 90034
(213) 474-1315 (res)
[Richard Rathburn, KB6NQ] "I mainly sell pc boards from QST, Radio
Electronics, etc., and a few of in-house design. I also sell IC's, etc."
Send a SASE every now and then for his most recent flyer. He also has boards
for some Motorola Application Notes.

MANUALS:
Eico Electronic Instruments Co., Inc.
363 Merrick Rd
Lynbrook NY 11563
Note: No current kits, EICO manuals and schematics only

PUBLICATIONS:

NUTS & VOLTS MAGAZINE
430 Princeland Court
Corona CA 91719-9938
1-800-783-4624 (subscriptions)
1-714-371-3052 (subscribe by FAX)
All advertisements magazine (though they've just publishing small projects).
Issues are $2.00 (at least, that's the price on the cover), subscriptions
are (third class mail, USA:) $12/1 year, $21/2 years, $60/life, (first class
mail USA) $20/1 year, (Canada/Mexico) US$22, (other foreign, air mail) US$55.
A subscription also entitles you to one free classified ad of 40 words.

Ham Trader Yellow Sheets
PO Box 15142
Seattle WA 98115
"SUBSCRIPTIONS: U.S.: 24 Issues(1 yr) $16.50 50 Issues(2 yrs + 2 issues) $32.
75(3 Yrs + 3) $48. CANADA & MEXICO: 24/$20. 50/$39. 75/$58. FOREIGN: $38
a year sent Airmail. Published 2 ISSUES A MONTH sent 1st Class Mail...

NO LONG WAIT FOR AD CIRCULATE! NOTE: A $4/4 issue MINI-SUBSCRIPTION may be ordered by potential subscribers, or WITH AN AD to qualify for the Special Subscriber Ad Rates given below:" Non-subscriber ads $1/{word,number,group} per insertion; subscribers: businesses or other for-profit sales $0.75 per word; ads involving items solely from or for your own use $0.35 a word; hamfest ads $0.35. Ads and ads with subscriptions should be sent to POB 10253 Sarasota FL 34278 during the winter; spring through fall they go to POBox 2057, Glen Ellyn IL 60138.

Howard W. Sams & Company
P.O. Box 7092
Indianapolis, IN 26207-7092
(800)-428-SAMS
Publishers of SAMS PHOTOFACTS and many other electronics books. There is an Annual Index of SAMS PHOTOFACTS whose cost I have forgotten. In-print Photofacts run between $14.95 to $39.95 (for computer Photofacts); they will photocopy out-of-print Photofacts for $11.95 + $2.50S&H for one page, plus $.55 per page thereafter.

RF Design Magazine
P O Box 1077
Skokie IL 60076-9931
(312) 762-2193
A magazine for professional RF designers. Subscriptions are $38 per year in the US, $48 in Mexico and Canada, $51 elsewhere, unless you appear to be a "qualified subscriber" (i.e. are in serious danger of convincing your company to buy a $12,000 spectum analyzer based on an ad) in which case it's free. Heavy on theory, and even the advertisement articles are educational.

Elektor Electronics USA
Caller Box 876
Peterborough NH 03458-0876
A translation of the Dutch Elektuur magazine. Lots and lots of construction articles each issue, a few of them even interesting. Subscriptions are currently $28/year.

NOTES:

This file, and many others, are available for anonymous ftp from ftp.cs.buffalo.edu. It is also available from another anonymous ftp site, toxicwaste.mit.edu:/pub/archive/sci.electronics/Mail_Order_Companies. (Contact warlord@athena.mit.edu to offer things to the latter)

CHANGES FOR $Revision: 2.9 $

Dick Smith Electronics is no longer carried by American Electronics; if their catalog that I just requested is promising, I'll list them instead.
Added FAR Circuits, having just stocked up on W1FB Universal VFO pc boards.

Hi Jim,
With such attitude you may be prime candidate for deportation, since
if everybody will be sane like you our economy will bancropt in no
time.

P.S. from time to time I still use SW-3 National from 1932 super-regenerativ
1-V-1, but PLEASE don't tell this to anybody.

I think the procedure is very similar to marking a memory to be skipped. The only difference is that rather than quickly hitting F/M MR, hold down the F/M key until the memory starts to flash. Then, hit the MR key.

Hi,
Prime importance in connecting any source to any instrument is the VOLTAGE.
If your HT req. 12V nom. you are OK, as far as the current you need to make sure that PS can supply at LEAST 5A. If the capacity of the PS is more than
needed so better, it will work under-rated.

It is the same as driving Testarosa at 25 m/h instead of 210 m/h.

I certainly understand the point of view that says "I can use
cheap radios 'cause I don't need a lot of bells and whistles".
On the other hand, not everybody drives a Yugo; some folks
pony up for a Rolls Royce. Luxury and features have value
and utility. A Yugo will get you there, but it's not a very
pleasant trip; many are willing to pay extra for comfort and
convenience. If you can get along with one VFO, no memories,
no scanning, no passband tuning, no digital display, no notch
filter, then more power to you. Some folks feel that a few
luxuries are worth the price.

On a similar subject to "dark suckers", I recall a few years ago seeing a bogus "data sheet" for a Dark Emitting Diode.

This was done up like a real data sheet (before laser printers too) and was very funny. It'd be fun to see it again.

Anyone have this to post?

Dick Dowell (rd@dtc.hp.com)

3386. Fire bottles: Screen grid bias

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 17:32:11 UTC
From: lockwood@acidqueen.Eng.Sun.COM
Message-ID: <l3hnsrINN411@smli.Eng.Sun.COM>
Source record: 288726

I'm working on repairing an old firebottle transmitter, a Gonset GSB-100, and I don't understand what I'm seeing in regards to the screen grid bias on the final amp, a 6DQ5 used as a class A amplifier.

My '65 ARRL Handbook says that the 6DQ5 draws about 5mA of screen grid current and wants to see 150V (if I remember correctly) on this element.

In the GSB-100, the screen bias is derived from the 0A2 shunt regulator through a 100 ohm resistor.

What I'm seeing, as I crank up the carrier level while tuning the transmitter, is that the screen grid current goes up over 12mA. I don' t know if this is cause for alarm, but one side effect it has is that the increase in current is enough to cause the 0A2 voltage to dip below that necessary to sustain regulation. This strikes me as a Bad Thing.

Not understanding tube technology especially well, this leads me to wonder about several things:

1. The impression the Handbook gives me is that the screen current is or should be constant and its exact value is a characteristic of a particular tube type. Is this, in fact, true?

2. What would make the screen current vary? Changing the plate current? Changing the tube bias point? Something else?

3. Assuming that some variance in screen current isn't cause for alarm, should I be concerned about the fact that I"m seeing a value that is > 2X the spec in the handbook?

Thanks in advance for any enlightenment on this perplexing (for me) problem.

Regards,

Jim Lockwood - KM6NK

^^^^^^^^^^^^^^^^^^^^^^^^^^

Not necessarily. You would have to compare this loss to the attenuation caused by the car body if you were using the handheld without the repeater antenna. This will depend on the type of car you have, and where you are sitting in the car relative to the direction to the cellular site. I suspect that the passive repeater really *doesn't* help very much, but you would have to make this comparison to be sure.

3390. Kenwood HT mike question

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 18:14:59 UTC
From: cvm@nauvax.ucc.nau.edu
Message-ID: <12JUN92.18145940@nauvax.ucc.nau.edu>
Source record: 288708

If anyone out there has a the SMC-31, SMC-32 or SMC-33 speaker mike for a Kenwood HT, could you please tell me how many contacts (2 or 3) there are on the large diameter connector on the mike?

I am trying to convert a mike with a 5 pin DIN connector to work with my HT. The info I have gotten so far for the HT shows that the PTT and Mike Audio contacts are on the sleeve and center ring respectively of the large jack. The tip contact is not used. Ground comes from the sleeve of the small jack (the speaker). If the adapter on the mike has only two contacts then I assume that PTT and Mike Audio are being provided by the same source in the Mike. If there are three contacts I would guess PTT and Mike audio are provided seperately by the Mike. Thanks.

Some quick changes to my listing:

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.
Pelham NH 03076 Pelham NH 03076
(603) 635-2235
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller
chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of
! parts in general. Send $1 for the catalog (but note that they are currently
! (12-June-92) out of catalogs and it will probably be months before the next
! one is ready).

Someone mentioned in mail that they've sent for catalogs twice without
reward; I asked about a catalog when I ordered something a couple of months
ago and the above was roughly the story (no timeframe was mentioned, but
they've been slow with new catalogs in the past).

And an addition to the KITS listing:

+ John Langner WB2OSZ
+ 115 Stedman St.
+ Chelmsford, MA 01824-1823
+ (508) 256 6907
+ Slow Scan Television for IBM PC.

I'm (still) looking for any information on programming an 800MHz
Motorola Syntor-X (non-trunking version). My radio is currently
set up for 2 channels, but with a ROM replacement I intend to go
to at least 10. I just need to know what to put in that ROM!

(Sure, I could take it to a Motorola dealer, but that would take
all the fun out of it. Besides, I may want to reprogram this thing
frequently).

Thanks in advance for any info!

Wayne Cronin WA5VIF
wmc@phx.mcd.mot.com
^^^^^^^- yep, this is Motorola, but not the radio division!

3393. audio switch for ham radio

Hi, I'm planning on putting a 2m radio in my car and I have a small problem.

I like to listen to my stereo loud sometimes, this makes it difficult to hear
when the 2m breaks squelch and I have to turn it down before I key up the mike.
What I need is a switch that will go between my head unit and my amp that will pad down the
stereo and let the radio through whenever squelch is broken or when
I key up the radio.

I would appreciate any net.wisdom you might have for me.

Geoff

A Light In The Dark

Bell Labs Prove Existence of Dark Suckers
(Reprinted from the Bell Labs Newsletter)

For years it has been believed that electric bulbs emit light.
However, recent information from Bell Labs has proven otherwise.
Electric bulbs do not emit light, they suck dark. Thus they are now
called dark suckers. The Dark Sucker Theory, according to a Bell Labs
spokesperon, proves the existence of dark, that dark has a mass
heavier than that of light, and that dark travels faster than light.

This is bogus. Dark is made up of particles that scientists call
"darktrons". Not dark suckers.

3397. Warning -- Stolen Ham Equip. list

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 19:45:45 UTC
From: leadfoot@bigbootay.sw.stratus.com
Message-ID: <3880@transfer.stratus.com>
Source record: 288711

On 6/9/92 the following gear was stolen. Please keep an eye out for it a the flea-markets. All of this gear has been reported stolen to the police, Kenwood, and the insurance company.

Kenwood Tri-band FM Transceiver TM-941A SN: 10800420
Kenwood 220MHz FM Transceiver TM-331A SN: 10700021
Kenwood HF/6M All-mode Transceiver TS-680S SN: 9050486
Kenwood External Auto-tuner for 680 AT-250 SN: 7120172

Also taken was the car! Three magnet mounts (2 Larsen NMO, 1 N Comet), three 1.2GHz antennas (Comet 3 5/8, Diamond 4 5/8, and Maldol 5/8 over 1/4), Comet tri-band 2M/220/440 antenna w/tri-plexer, and antennas for 160/75/40 20/17/15/10/6M.

Also stolen was an Escort radar detector SN: 498368

Thanks,

Mark (WE8K)

3398. Radio Prices

How about this..... The gear of yesteryear can still command a hefty price, even if it isn't functioning. The gear of 'nexteryear', like the computers in our cars, will command a hefty price if working and a small plastic bag if it isn't.

Russ, KA2KFH

3399. Kenwood TM-732A Resistor Puzzlement

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 20:20:48 UTC
From: Chris.Epler@f111.n207.z1.fidonet.org
Message-ID: <11670.2A3A3C14@ofa123.fidonet.org>
Source record: 288590

I'm a little confused by the mods posted by Fred Lloyd (Hey, at least it works!)...

I believe I have applied the K4 MOD, but am not all that sure. I have removed the green wire, used it to jumper the FAR LEFT solder PAD (Which >I< believed to be R22) and moved the chip resistor from R20 to R19. This seems to have completed the K4 mod, but does it? I noticed in a message posted by Fred on April 27th that in Note #7 he says the K2 mod includes 410-770 Mhz receive, however, my receive only covers 410-470...(Typo?)

I would really appreciate any clarification anyone could provide (Most notably,Fred Lloyd...) Tkx!

3400. Kenwood Features/Games TM-741/TM-732

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 20:24:32 UTC
From: Chris.Epler@f111.n207.z1.fidonet.org
Message-ID: <11671.2A3A3C14@ofa123.fidonet.org>
Source record: 288591

I received a FAX yesterday with some of your messages, however didn't get the complete message on the GAMES for the TM-741/TM-732. I own a TM-732A and was curious if there are GAMES built into this radio, and if so, how do I access them?

I believe I've completed the K4 mod, does this sound right?:

Removed green wire.
Move chip resistor from R20 to R19
Solder green wire to jumper R22 (solder pads on FAR left of bank of pads)

I am a bit confused as to what R22 really is. Is it the green wire (W1?) or actually R22 where the solder pads are? Confusing.

In article <14570417@hpnmdla.sr.hp.com> alanb@hpnmdla.sr.hp.com (Alan Bloom) writes:
>In rec.radio.amateur.misc, jbloom@arrl.org (Jon Bloom) writes:
>
>>In fact, there is an
>>opportunity to change some aspects of QEX right now. I solicit any
>>suggestions anyone has for improvements to QEX.

Wow, if QEX started doing the stuff Alan Bloom (Hey, wait! Alan
Bloom replying to Jon Bloom??? hmm, something fishy here... :-)
(JUST KIDDING!!! REALLY!!!!)

Lets see, where was I.. Oh, yes: If QEX started to do that
sort of thing, I'd subscribe for sure. (Just sent in my
renewal for ARRL and ALMOST decided to try QEX... but
decided no for now. But I'm willing to be convinced otherwise)

Also:

...<many great ideas deleted, only the following kept>....

>Regarding article ideas. How about tutorials on a higher technical
>level than would be appropriate in QST? For example, people seem to
>think that digital filter design is way beyond the non-engineer, but
>the basics are pretty straightforward.

Yeah, how about an article, including some generic source
(even pseudo-code would be fine) for the basic DSP functions
(you know, FIR and IIR and FFT and such like). If nobody
else does it, I might get around to doing something like
that once I finish (1) the Spectrum Analyzer project I'm
currently preparing to work on (yes, yet another tv-tuner
Spectrum Analyzer, but this time the software will do
something USEFUL for you as opposed to that painful software
that came with, e.g, the one written up in R-E (now "Electronics
Now", btw) a while back); and (2) the digital filter program
for my PC for use with some stuff a friend in Tucson and
I plan to do with the 1790meter (160kHz? whatever) band.

>... how about a tutorial on the Internet and how to get
>connected, for those not in the know?

I'll volunteer to write something like that, if QEX wants it.
(At least I'll give all the info *I* know about it, which is not
as much as some folks, I'm sure!)

>AL N1AL (Full of ideas as long as I don't have to do them!)

Hey, for the right price I'll do almost anything :-)

Proof for that statement is left to the reader, after
they consider the following:

remember, I'm the one who started the Callsign Project
in the first place :-)

(Speaking of the callsign project: Just got off the phone
with NTIS - they are supposed to call me back on Monday to
let me know "where's the tape")

Just call me "ramblin' rusty" :-)

3402. RE: CONVERSIONS OF CORDLESS TELEPHONES TO 6'MTRS AND 2'MTRS

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 20:52:06 UTC
From: ron@nsu.DNET.NASA.GOV
Message-ID: <9206122045.AA20843@east.gsfc.nasa.gov>
Source record: 288713

In a message earlier today I saw a reference by KE4ZV about some conversions he had made to a couple of cordless phones for operation on 2 and 6 meters. I can see the 6 mtrs conversion..that shouldn't entail too much. But what about the one on 2 mtrs. What frequency did the phone start out on. I maybe be misunderstanding but I thought all cordless units were on 46/49 mhz with the exception of the new 900 mhz phones just hitting the stores.

Thanks for any info. I would have mailed him direct but have trouble with uucp addresses from here.

3403. Call sign logging program(vhlogger update)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 20:54:29 UTC
From: vjh21@cas.org
Message-ID: <1992Jun12.205429.28092@cas.org>
Source record: 288714

I messed up my original posting to this news group.

The program I wrote 'vhlogger' is for Amiga computers only.
It requires AmigaDos V2.04 or greater.
I've uploaded it to HUBCAP.CLEMSON.EDU in the directory
/pub/amiga/incomming/stuff.

You should find two files:
vhlogger.lzh
and
vhlogger.readme

The readme file follows:

vhlogger An amateur radio call sign logging program. This
program uses a btree mechanism to provide fast storage and
retrieval even when the data base is on a floppy drive.
This is Version 1.0 Binary only, shareware.
Prereq: AmigaDos V2.04 or greater
Author: Vincent Herried (KA8CTE)
email: vjh21@cas.org
usmail: 1688 Staffordshire RD.
Columbus, OH. 43229-2142

sri I left out the prerequisit info, heck I've not even seen my original
posting comming back.

3405. Re: Cellular repeater antenna vs wired - how different?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 21:53:40 UTC
From: whester@isis.cs.du.edu
Message-ID: <1992Jun12.215340.5373@mnemosyne.cs.du.edu>
Source record: 288717

Check out the letter to the editor in the June 92 issue of
Mobile Radio Technology...

the writer tested these "passive repeater" antennas using a
screen box -- with and without the passive repeaters.

Conclusion: when the box was completely sealed, using RF
carrier at 28dBm, calls could not be made. When the passive
antenna was added to the box, still no calls could be made.

When a small door in the box was opened, with no passive
antenna, calls were completed.

The writer also noted that with the box closed and the passive antenna
installed, the RF power coming out of the antenna was barely
measureable on the spectrum analyzer.

Overall, the writer feels these type of antennas don't work...
but only act as a placebo for the customer...
on the other hand if the customer really is convinced that
they help, then let them use the antennas.

3406. Incentive Licensing

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-12 22:12:56 UTC
From: fletcher@moho.uwyo.EDU
Message-ID: <9206122212.AA26908@ucsd.edu>
Source record: 288718

This thread made me set back and think about my entry into radio. For years I had a a ham living across the street from me. I had another friend who also knew the ham and we'd descend in committee on his house when he was home. He provided ideas for projects to build, helped with science fair projects and was generally an inspiration to me as far as electronics went. I knew this guy for 10 years before I got a license myself. Until then I did the shortwave listening thing and built hi-fi oriented things. Teens like their music loud, after all. Some hams I knew during that time-frame generally had bad feelings about the Extra class license. My perception was they felt cheated or punished (loss of frequencies) or... who knows? ... for something they hadn't done. I can remember feeling some anxiety about becoming a licensed ham and subsequently being treated as shabbily.
A real incentive, that.

I'm a Technician class (5 wpm, General Class theory when I took it in '75). I've been able to do what interests me. With all the messing around with the Tech that's been going on lately, I find myself wanting to upgrade just to get clear of the Tech class so when the great cleanup happens, I won't end up with those same good 'ole bad feelings. What an incentive.

I don't have the slightest interest in HF. Others love it. Bully for them. I'm considering an upgrade to keep from being messed with, not due to an interest in HF. I've got Novice HF privs already. I don't need anything more. What incentive?

U.S. Amateur radio desparately needs to dump this divisive license class system.

Reid, WB7CJO

3407. Disney special-event certificate received

Date: 1992-06-13 00:49:18 UTC
From: winter@Apple.COM
Message-ID: <68640@apple.Apple.COM>
Source record: 288721

If you worked one of the special-event ham stations celebrating the opening of EuroDisney and you haven't yet sent away for your commemorative certificate, I urge you to do so. I got mine the other day, and they're really beautiful.

They're about 8x10 inches, filled with a photo of M. Mouse standing in front of the castle. In the upper left is a listing of all the SE stations, with the ones you worked checked. (There's no QSO box per se; an accompanying note from Mickey says "My ears heard your signal as 59". Well hey, with ears as big as his... :-)) Vertically along the right is your callsign neatly typeset; I'd guess they ran the certificates through a laser printer.

Since all QSOs are confirmed on one certificate, you obviously don't need to send multiple QSL cards and envelopes.

73 and go see "Fantasmic!"

Patty

p.s. I don't have the QSL address handy, but I think it was in all the April ham mags. _QST_ for sure.

In article <1992Jun12.173644.22591@linus.mitre.org> m14494@mwvm.mitre.org (Mike White) writes:
- > still 27.8 dB in the hole.
- ^^^^^^^^^^^^^^^^^^^^^^^^^
-
- Not necessarily. You would have to compare this loss to the attenuation
- caused by the car body if you were using the handheld without the repeater
- antenna. This will depend on the type of car you have, and where you are

But that wasn't the question. dean@cbmvax.commodore.com (Jeff Dean) asked "what sort of loss [he] would be taking using a wireless repeater for my handheld cellular phone vs using a wired antenna?"

The suggestion, then, is to not use the ducky - bite the bullet and get a real antenna for the handheld and use it as a mobile while in the car. This concept is not new for hams. I know several folk whose first 2m rig was an HT which they would connect to lighter-plug and 5/8-wave antenna while in the car. Ugly, but cheaper than a real mobile rig. :-)

Take care.

24AT Mods Help

Folks:

Has anyone performed the "2 diode" mod on Icom's 24AT? I'm having trouble discerning which of the empty positions on the pcb are the correct ones. I've gone over the Icom supplied schematics but many of the traces disappear into the inner layers of the pcb. Any help is greatly appreciated. (Obviously the file that I have does *not* have any specific info about the location of the relevant diodes; if there are other files with *any* details, let me know)

Thanks in advance!

> The real question though:
> WHAT SHOULD I GET?
> A 200XLT?

Since I use a PRO-2004 and a PRO-2006, I'm a bit partial to these. They're extremely modifiable, and even if you do no more than the diode clip (to gain the speed increase) -- install the diode in the 2004 -- it's a good deal. For those 800 MHz business band trunked systems, you'll want the ability to switch into 30 kHz steps so you don't miss anything. 12.5 kHz just doesn't cut it. Of course you could drop to 5 or 10 kHz, but that's pretty slow. In addition, isn't the 200XLT only 40 channels? Maybe I'm thinking of another Uniden. I think it's 200 channels. Dunno. Anyway, the PRO-200x line is 400 channels -- twice the capacity for just a bit more money (or around the same price used or if you shop around). Also, you can add on, increasing the capacity to 25,600 channels. Then add a computer interface to manage your frequencies and program the scanner. If you do nothing but listen to the local 10 police channels, any old scanner will do. If you want to work on the ultimate scanner system, I'd go with the PRO-200x scanner. But you'd better hurry. I hear that there's a law in the works which will put the kibosh on any all-band scanners. Read that to mean "anything which will pick up cellular". . .

RTTY DX Notes 12 June
RTTY DX Notes for week ending 12 June, 1992 (BID RTDX0612)

First let me apologize for the notes this week. There was a software
fault in one of the forwarding BBS stations which precluded me from
collecting all the information that may have been available, but such
is the way with computers. But there are still some good stations
listed. Second, this weekend is the ANARTS RTTY DX Contest, from
0000Z Saturday til 0000Z Monday. Message is RST, Time (UTC) and Zone.
Logs to Box 860, Crows Nest, Sydney 2068, Australia.

Our thanks this week go to, with apologies to those who have been
missed due to the software fault: I5FLN, IK5AAX, NT3B, N5PSI, TG9VT,
VK2EG, W2JGR and the Twin-Cities DX Packet Cluster Network, and
ZL2AAV. Thank you all for your assistance.

Notes of Interest.

The VK9NS (Jim Smith) DXpedition appears to have settled for August
for the trip to Mellish Reef (VK9M), Willis Island (VK9W), and Baker
and Howland Islands (KH1) later in the month or early September.
Depending on conditions, weather etc, there is also the possibility of
a foray to Heard Island (VK0) later in the year. One may be permitted
to say that would be a hot to cold DXpedition. Sunshine and snow.

Sorry chaps, thats all I have this week, due to the software fault.
We hope for better things next week.

In Wash. D.C. area we have both 4 and 5! 4 has poor quality, but five is fine! The problems with four have convinced some people (my family inclused, though not primarily for that reason) to get cable.

HTs, like other travel equipment such as cameras, are valuable enough to warrant having them in the carry-on bag. You will have peace of mind knowing where this expensive item is at all times, and not have anxiety attacks when you get to a destination and the luggage hasn't.

A word of caution. If you are carrying-on an HT the security people at the x-ray gates may ask you to turn the radio on to show that it works. I satisfy them by turning the radio on and opening the squelch. The noise reassures them. I keep my HT intact until I have cleared the gate then remove the battery pack to avoid accidental turn-on.

I have also carried-on an R-1000 and a Hallicrafters SX-110 (32lbs), but that was before Locherbie.

>just theory, it actually works and we all live in harmony.

This is usually fine for other users of the band, but in many cases FM repeater outputs in the low end of the 440-450 segment raise havoc with the ATV repeater's input. If you've solved that problem, that's great.

There's some new 902 MHz equipment coming from an outfit in Texas that our local ATVers have started using. It's compatable with the Rabbit consumer equipment, but with good stability and higher power. They're using it as input equipment to a crossband ATV repeater with it's output on the 420 MHz band. That allows them to use cable boxes for receiving. I'm told, I only do commercial broadcast video, that the system works well. I'm also told that typical cable boxes need a preamp to be usable since the normal cable signal is 30 db stronger than the normal amateur signal. Those of you already doing ATV may know about all this, but several of my friends interested in satellites tried to receive retransmissions of NASA Select from this repeater with bare cable boxes and found out it didn't work very well. A good preamp makes the difference.

>
>Inflation shouldn't be a factor, since it would affect meat prices as well
>as car prices.

Unfortunately for farmers, farm commodities haven't benefited much from
inflation. Meat on the hoof has about doubled in price in the last 30 years
while the dollar has declined 12 fold in the same period. The wheat in the
hamburger bun is actually cheaper in raw uncompensated dollars than it
was 30 years ago. (The lament of a farmer who lost 3/4 of his farm to
the bank a few years ago.)

>I don't think federal standards really have had much to do with it. In
>these days of much higher fuel prices, customers demand more fuel-efficient
>cars. One way to increase fuel economy is to haul less car around.

Actually, it's the federal CAFE standards that have had this effect.
In inflation adjusted dollars, gasoline is cheaper today than it was
in 1960. It's the federal fuel economy standard rather than consumer
demand that has shrunk cars. Evidence that consumers prefer larger
vehicles is the rise of pickup and van sales since sedans have become
tiny.

>Hence, cars are made from lighter materials, but cost roughly the same
>(on the "meat" adjusted scale) as similarly-equipped cars of yore.
>
>So, while cars may cost more per pound than hamburger today, it has more
>do to with the weight of the autos than the price.

Cars, like radios (this is a *radio* group so I have to at least
mention radios), have indeed gotten smaller and lighter, but cars
haven't necessarily gotten better. But their price has risen rapidly
while prices of radios have not. Inflation can't account for that.
Consumer demand doesn't account for that. Federal standards on fuel
economy, emissions, bumpers, air bags, third tail lights, etc, etc,
etc have been primary drivers of auto cost. In addition, cars today
last longer because of better corrosion proofing and the smaller
strain a light car places on it's components. This has resulted in
lower annual replacement unit sales. The manufacturers have raised
their unit prices to make up for the reduced volume. This in turn

has driven more people to the used market. It's a vicious upward spiral. GM now says it's going to reduce it's models from 44 to 7 over the next three years to increase profitability. The only way to make more money with fewer units is to raise prices. The consumer suffers a double whammy, less choice at higher price.

This applies to radios because reduction in unit sales of radios are likely to result in higher prices and less choice. So shame on all you used radio buyers and builders. :-) :-)

Ok, I'm not going to give a blow by blow conversion article here,
I'm saving that for QEX. :-) But here's the scoop. For 6 meters,
a crystal change does the deed, then tack on an amplifier stage.
For two meter transmit, you follow the phone output with a tripler
and amplifier. For receive, you triple the receiver chip LO and feed
it to an external first mixer. Hey, this stuff is FM not rocket science.

>so, why is their a question on the 610 about pending applications??)

The FCC doesn't mind two pending applications, I think the problem
is that they can't process the second upgrade without the license
copy from the first. Other pending 610's (like change of address)
are presumably OK, you just can't have 2 upgrade 610's in the system
at the same time.

>> guess that is probably because I'm a weak signal VHF enthusiest. There
>> are very few good columns devoted strictly to weak signal work anymore
>> so I would hope that this column does not get altered.

I'm not suggesting that the column be *altered* but I am suggesting a name change that more clearly reflects it's DXer orientation. While a good preamp is often a good preamp whether it's for some contest DXer or for a satellite operator or packeteer, it may be totally unsuited to an ATVer or SS operator due to bandwidth limitations, or to a repeater operator due to inadequate intercept. Both VHF+ Technology and The World Above 50 MHz are weak signal DXer oriented. Mention of any other technical applications of VHF+ spectrum is accidental. I think the titles of both these columns should reflect this orientation. I don't want to kill these DXer forums, but the implication of both these columns is that nothing worthwhile happens at VHF+ except DXing.

Note that this reflects a personal bias of my own that the *content* of communications is more important than mere distance. DXing is singularly content free even though it can be technically challenging. While it may be novel to contact a station in China from the US, I'm more interested in a possible exchange of views than in QSL cards.

>> I really miss the microwave column that Bill Olson, W3HQT from Down East
>> Microwave used to write for QEX. I presume Bill didn't have time to
>> write it anymore, so that is why it disappeared. Too bad, because the
>> microwave spectrum does not get enough coverage.

I agree that the microwave spectrum is sadly overlooked, and not just for DXing potential. It's ideal for point to point video and data links. When everything that's printed about microwaves is on how to work a grid square 100 miles away, the majority of hams yawn and flip the rig back

to 20 meters. Talk about megabit data rates or video links, applications that can't be done on 20 meters, and a different, and more intense, group of ears perk up.

DXers have made important technical contributions to VHF+, and I hope that continues, but it's time we started seeing in print that there is more to VHF+ than straining to hear three dashes below the noise floor, or shouting into a ricebox. Actually, I'm annoyed mainly by the title "The World Above 50 MHz" rather than by "VHF+ Technology". *I* live in the world above 50 MHz, and nothing *I'm* interested in is ever acknowledged as existing by that column. Columns, by being in front of us every month, can be much more effective than occasional feature articles in directing interest to new frontiers. I hope that interest includes more than just DX box scores. I wouldn't be upset if the title of that column was "DXing above 50 MHz." It would be less misleading.

Actually, the law says it's illegal to have equipment "capable" of receiving police frequencies in your car. Clearing the scanner memory doesn't make it incapable of listening to police frequencies. The fact that it's a scanner, and that it *can* be tuned to receive police transmissions is sufficient evidence to get you cited. You'd be better off camouflaging the scanner to look like a tape deck.

My family made a trip to Hawaii a few years ago, and decided to make a DXpedition out of it. We packed up our Kenwood TS-120, power suppy in a black small suitcase (which turned out to be a mistake as far as the security people). Then, we also had a fishing rod case that held our Spider mobile antenna, along with a frying pan that we used as a ground plane. We only had a security problem from the U.S. to Hawaii, but once we were in Hawaii, they didn't even look twice at us, except when we wanted to go back to the mainland. We had to break everything apart, and connect up the power supply to show that everything was working O.K. My mind is fuzzy, but I also seem to recollect taking the cover off of the TS-120 too.

Anyone else have similar experiences??

(Maybe next time I will make a cutout of a cat skeleton with sheet metal, and put that in my suitcase)

>e-mail or by posting here. Thanks.

I have had the chance to play with the IC-P4ET for a few days.
In this article, I'll describe it and compare it with the W2e
I own myself.

The P4et is the European 430-440 version with keyboard to send DTMF tones.
CTCSS and DTMF decode comes as an option, to be bought extra.
The rig is small (13 cm or so), and light as is common in current
handhelds.
The display is large, about 2 a 3 cm and reading the frequency will be
no problem at all. In the right down corner, there is space for the
status of the AI system or the time (the last of which is very much more
useful. See later).
ICOM again made the mistake to have the display stick out, which makes
it very easy to be scratched.

The use interface is similar to the W2e I own, with some exceptions.
On the W2e, the function of the key isused by default (tone squelch
key), while on the P4et the default action is the digit (for entering
a new frequency). Also, some functions have moved, but nothing important.
A disadvantage is that the PTT key is a bit difficult to use. It is
very small and has to be squeezed pretty hard - no long transmissions.
The P4et has one big advantage over the W2e: pressing PTT twice
will give 1750 Hz, no need to search for the special key.
Generally, the P4et provides the functions seen on many of the
handhelds these days: many memory channels (99), various scanning
possibilities, CTCSS tones and tone squelch (option), DTMF tones
and squelch (squelch optional), call channel, clock, auto power-off,
monitorin of the input of a repeater, DTMF phone dialler, etc.
The light function has improved a bit because it also lights the keyboard,
which the W2e does not do.
The P4et has to be switched on/off using the volumer knob, there is
not a button like the W2e has.

ICOM has invented a new battary form factor for these rigs. The big
advantage of the new cells is that they slide in the housing of the rig,
instead of slide under it. This makes the mechanical design much more
stable: it is not possible to break off the battary pack like the

W2e does when it falls one meter or so. The packs are sealed so if it dies, no possibilities to repair it.
The rig produces 2W on it's accu-pack (W2e: 1W) and of course 5W with 13.8V. The P4et uses biological TX time restriction (the casing is used as cooling body so if the unit is too hot to touch, it's time to key down. :-)

For all you scanner enthousiasts, please be advised that at least the European version can NOT be expanded for receive out of band without a hardware modification (voiding warranty). It is NOT possible to expand it with some keyboard action like the W2e can.
ICOM has advertized that keyboard expansion is possible but that is FALSE advertizing.

So far, the 'normal' features of the rig. The AI button can be used for several features. Here are some of them:
- The P4et can be used for a quiz. The manual has sets of 15 questions on various topics. Depending on the number of right answers, a number of stars are shown on the display. The manual says 'amaze your frends' but I advise against that if you don't want to look silly.
The manual also says that the number of stars yielded does not neccessary reflect your knowledge on the subject, and I think this is much more true. The quiz feature is clearly invented because of extra ROM space in the controller, but I don't think this is useful.
- By setting the number of stars in the 'star set' mode, you can hide some less frequently used features. I guess they did this because they think some users can't remember all the different features. Whether this is useful for you is something to decide for yourself (given the average age of usenet readers I don't think it goes for any of us :-).
- The most useful function of the AI button is to repeat the last used function. For instance, if you want to access the DUPlex function, you need to press the F-key combined with another button. To repeat the function, you can also press the AI button instead.
The function the AI remembers is shown in the lower right corner of the display (replacing the time shown there).
As you can see, I don't think the AI function is very useful.
IMHO, the money spent on AI was better spent on a battary indicator, which the P4et (and the W2e) lack.

Concluding, the P4et is a nice rig, but forget about AI. It is smaller than the W2e, more rugged, has better lighting possibilities and the 1750 Hz PTT feature, but if I were to choose, I'd spend a little bit more money and buy a W2e instead. The rigs are very similar but because the W2e is dualband it's much more useful.
Given that the P4et is newer, I find it a bit of a disappointment.

I hope this is clear enough.

> expensive / how expensive are they?
I bought my cells at the local radio outlet (Jacobs Breda Electronics,
+31 76 212881) but I think you can get them closer to you. Otherwise,
give them a call.
I payed Hfl 12.50 a piece for them, which is about 3 times more expensive
than regular NiCd cells. I think the price will drop in time.

I heard that NiMH cells do not keep their charge long if you do not use
them. Whether this is true or not, I don't know.

> I'd also like to know, if one can quick charge NiH cells like
> those regular NiCd cells - pulse charge with 0.5-1 A pulses.. I
> have currently the normal BP-83 battery that is shipped with

> mAh cells (plus two 12 V 3 Ah lead batteries, which give more
> power, but they also are heavier.. need big pockets). More mAh
> and less weight would sure be nice.
Somebody else reported that he quick-cherged the cells as if they were
regular C NiCd cells. I have not tried that.

>> dummyload FA-1443BB that comes with the rig. I don't know what it is made
>
> Wonder if you can you recommend any.. ?-)
I have played with two replacements and they both work fine. The Diamond
RH77 antenna is a long antenna, 40 cm, but flexible and light. It is a
5/8 lambda for 70 and a shortned 1/2 lambda for 2m if I remember correct.
It is about the best of antenna that still makes it a handheld, I think.

I'm mostly using it if I need a good portable antenna (hotel room
or something like that).

I also tried the Diamond RH700 which is much smaller, 18 cm, about the
same size as the antenna delivered with the rig. Of course it is slightly
less than the RH77, but very usable and much better that the FA-1443BB.
It is what I use now.

It seems that the antenna that comes with the USA version, FA-1443B, also
is much better than the BB version. I have not verified that.

Why ICOM would put a junk antenna and leave out options (tone decoder module) in the European version of the rig, I don't know.

Disclaimer: I have no relations with these products other than a customer.

You should probably check the wording of the law. In VA it's illegal to
use a radar detector. It's also (by the book) illegal to have a radar
detector in the passenger compartment of the vehicle. In you state they
might work the scanner law in a similar fashion.

3427. How does 'Trunked radio' work?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-13 23:31:18 UTC
From: geertj@ica.philips.nl
Message-ID: <1992Jun13.233118.12067@ica.philips.nl>
Source record: 288607

[While this is not directly about hamradio, I can't find a more appropiate
group and I guess some of us hams have designed/serviced these radios]

Hi,

I heard that last week, the local authorities here have switched their
old single-channel radios to 'trunked' ones. This as preparation to
a police force for a much greater area (region instead of city).

Shure enough, while looking for the signals, I found that something
has changed. It looks like the rigs change frequency
every time they make a new call. People complain that they have to
wait for 1 sec after they have given PTT, apperently to give the rig
time to tune.

I would imagine that such a new system would be all digital, keeping
out the scanner freaks. However, while listning in, I found out that
the transmissions are clear NBFM. It seems that they also have an
encryption possibility, sometimes noise (like a G3RUH modem) is heard.
Why isn't encryption always used? I found that sometimes, people are
unable to produce a relyable signal (mobile flutter). Would that
be the reason that encryption is only used on demand?

Some channels are very loud, some have much less signal strength.
yet, they seem to be connected somehow. Sometimes a transmission
is heard on 3 frequencies. Assuming that it is routed somehow,
how would the installation know to whom a message should be relayed?

I also found out that the base station can read the ID of the rig
transmitting. However, I don't hear a startup signal on each
transmission, so it must be sent elsewhere.

I think the new units are made by Motorola, but I am not shure.

Does anybody recognize this system? If true, do you have some literature
on how it works? Thanks in advance for any information!

3429. CT & networking

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-14 03:22:28 UTC
From: CSMSCST@MVS.OAC.UCLA.EDU
Message-ID: <19920613202124CSMSCST@MVS.OAC.UCLA.EDU>
Source record: 288600

We're planning to try using "CT" in its networked mode this year at field day. I'd be very interested in hearing anyone else's experiences with networking. We're planning to run 3A (3 transmitter positions) plus a novice station, so I'm setting up a 3 PC network. I was planning to make the novice position a standalone CT, since it has a different call, and can work the same calls without them being dupes.

Do the 'packets' exchanged between the networked nodes have any internal checksum? The default comm setup is not to use parity. Is there a reason for this? I would expect to have trouble with garbled signals, due to long runs (RS-232 is only spec'd for 50 feet) and interference from xmtrs. Is there any reason to run at, say, 9600 instead of 1200 - I'd expect the traffic to be low enough to be handled at 1200, and the slower rate might be more noise imune.

3432. Re: Kenwood Features/Games TM-741/TM-732

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-14 04:15:55 UTC
From: au297@cleveland.Freenet.Edu
Message-ID: <1992Jun14.041555.29136@usenet.ins.cwru.edu>
Source record: 288602

I posted this before.. But it was awhile back.. So here it is again..

= Kenwood TM-741a GAME Dox *=*

Introduction:

There are actually three GAMES "hidden" on the Kenwood TM-741a Multiband Transceiver. These are UNDOCUMENTED and I'm not exactly sure who originally found these games??.. (I came across a brief description of these hidden games on rec.radio.amateur.misc on UseNet, but no one had the complete original Post!)

How to access "Game Mode":

1) Turn OFF the TM-741a.
2) Hold the [F] + [MUTE] and turn ON the TM-741a.

(You should see: -1- -2- -3- on your display, you're now in "Game Mode"!!)

3) Select the Game you wish to play by hitting the appropriate Band Select Button. (-1- = Band Sel 1 <far left>; -2- = Band Sel 2 <middle>; -3- = Band Sel 3 <far right>)

-1- ==> SLOT MACHINE Game

-2- ==> SPACE INVADERS Game

-3- ==> MUSICAL KEYBOARD

NOTE! The [VFO] will always exit you to the Main Game Menu (-1- -2- -3-).. The [MUTE] will normally Start the Game.

Game #1: SLOT MACHINE:

To play... Hit [MUTE] to start the numbers tumbling. Starting from the left and proceeding to the right, hit the Band Select Buttons to stop each number! If you don't get a 3-in-a-row match, the radio plays a sound and the game is over. ([MUTE] to play again). If you match 3-in-a-row, then...well I won't spoil it for you!.. (It's neat!!)

Remember; [VFO] to return to the Game Menu.

Game #2: SPACE INVADERS:

The Display... You will see the following display:

000000 ------ 0-0

(Score) (Invaders) (Selected Number - Number of Lives Left)

To play... Hit the [LOW] key to begin. The radio will then put a random number from 0 - 9 in the first position in the dashes.. (4-----) you must then use the [TONE] key to select the number the radio selected and then quickly hit the [MUTE] key to "fire" it. The number will then disappear and a new one will appear!.. If you don't act fast, the number will move to the second dash and another random number will appear, (84----).. If you're not keeping up, eventually the numbers will reach then last dash line and you will lose a life!!.. (Once all lives are lost, the game is over!) Also, you must "destroy" 30 numbers before moving onto the next round!.. Each round will start getting faster and faster!!.. So be prepared!! (It really gets TOUGH!!) All throughout the game it will keep score of how many "hits" you made.. (I believe it's 10 points a hit, I think!)..

Remember; Hit [VFO] to return to Game Menu.

Game #3: MUSICAL KEYBOARD:

I don't think this is actually a "Game"??.. What I've been able to figure out is that when you select this "game" the following message appears on the display: Enjoy Sound Play

At this point, the whole keypad on the face-plate of the TM-741a is a "Musical Keyboard"!!.. Try it, hit any of the keys, Band Select Buttons; Cont Sel Buttons; [MUTE]; [TONE]; [MHZ]; Etc...etc..etc... (Except for the [VFO] key, that returns you to the Game Menu!)

=-=

Welp!.. That about all I know!.. Some other things you could try are:

[F] + [REV] (I think!) and Power ON.. (NOTE!!.. This MAY alter some of your memory!! SO write it all down in case you need to re-enter it!)

...this will play some wierd tune on all of your Bands!! It's actually kinda neat...

And one other.. (Which might be documented..??)

[F] + [MHZ] (I think!) and Power ON..

...this will display a light EVERYTHING on the display!!!!!

=-=

If anyone has any other "hidden" features, Mods, etc.. PLEASE send them to me at:
usr1118a@tso.uc.edu

I hope this has been useful to all!.. and I appologise not crediting the person who originally found these Games!.. (Have no idea who it was!)

Have fun, and enjoy!!... Take care!.. and 73! ....KB8NHT (..Jim)

3433. RACES Bulletin #226

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-14 05:51:19 UTC
From: enge@almaden.ibm.com
Message-ID: <9206140550.AA06019@ucsd.edu>
Source record: 288604

Msgid : $RACESBUL.226

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.226 DATE: June 15, 1992
SUBJECT: MGT: Activation of a RACES unit. Part 2/3

Once activation is authorized, it should be properly announced as to beginning and ending. This can be complex for the person who is both the ARRL Emergency Coordinator (EC) and the local government's RACES Radio Officer, for it should be clear which unit is in activation. For example: On an official activity a RACES person begins at 0800 and ends at 1122; his or her ARES activity starts at 1123 and ends at 2100. Disaster Service Worker protection ends with the closure of the RACES activity at 1122 and all members are entitled to know precisely when that occurs, even though they may choose to continue to participate on an unprotected basis thereafter by their freedom of choice.

There are literally hundreds of opportunities to activate a RACES unit other than the perceived 'big ones'. Some of the activities where RACES personnel can be utilized include the following:

- Meetings, training, weekly nets, administrative, and other work at the EOC, office, or elsewhere; including installation and work parties.
- Holiday/special event traffic reports. Communications for government during races, parades, marathons, fairs, and other public events.
- Hospital nets.
- Radio link between the EOC or Incident Command and the primary Emergency Broadcast System station(s).

(To be continued)
EOM

RACES Bulletins are archived on the Internet at ucsd.edu in hamradio/races and can be retrieved using FTP.

3434. Propagation Forecast Bulletin 24 ARLP024

QST de W1AW
Propagation Forecast Bulletin 24 ARLP024
>From Tad Cook, KT7H, Seattle, WA
June 13, 1992
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB PROP ARL ARLP024
ARLP024 Propagation de KT7H

Last week saw some recovery from the low solar activity levels of
the previous week. The flux climbed steadily from the low of 99 at
the beginning of the month, and reached 129 as this bulletin was
being written on Thursday evening. The HF bands also recovered
somewhat with MUF levels a bit higher.

But the activity this week contrasts sharply with a year ago.
During the same week last year, we were reeling from solar flares
and auroral activity, and the solar flux was about 120 points
higher. Although ten meters is generally not very good this late in
the Spring, save for some sporadic E propagation, the 120 point
lower solar flux makes the 28 MHz band nearly unusable by
comparison.

There were some minor solar flares last week, with aurora forecast
as far south as the northern United States for Thursday evening,
June 11. The most disturbed day was June 8 when the A index was 24.

The solar flux should continue to rise slightly toward a peak of 135
around June 18, then drop to 100 around June 28.

Sunspot Numbers from June 4 through 10 were 138, 129, 124, 96, 85,
122 and 111, with a mean of 115. 10.7 cm solar flux for the same
period was 108, 115, 119.6, 115.7, 115.2, 118.6 and 125.4, with a
mean of 116.8.

I have removed the green wire, used it to jumper the FAR LEFT solder PAD (Which >I< believed to be R22) and moved the chip resistor from R20 to R19. This seems to have completed the K4 mod, but does it? I noticed in a message posted by Fred on April 27th that in Note #7 he says the K2 mod includes 410-770 Mhz receive, however, my receive only covers 410-470...(Typo?)
>
>I would really appreciate any clarification anyone could provide (Most notably,Fred Lloyd...) Tkx!
>

Sorry folks, but the 770 was a typo. It should have been 470.

Also note that enabling the K4 Mod results in the loss of the Clone feature, and maybe some of the other bells-and-whistles stuff. I stuck with the K3 Mod, which gave me the 420-450 transmit and the Clone feature still works.

From: welsh@dsl.cis.upenn.edu
Message-ID: <80302@netnews.upenn.edu>
Source record: 288611

I am doing research on Hidetsugu Yagi-inventor of the antenna of that name-
for my doctorate in the History of Science. I am interested in ANY info
about the man or ANY
early (1920's to 1930's)
Yagi antenna info/stories, particularly from old-timers in ham radio.

I really don't need any technical info about the antenna since I formerly
worked as an engineer (RF) and currently teach physics. I am interested in
early use of parasitic arrays in military, commercial and amateur applications.
By early, I know that Yagi's first US publication was in the Proceedings of the
IRE (now IEEE) in June 1928.

I am also interested in anything about Shintaro Uda, Yagi's professional
partner, whose first (?) publication was in the Journal of IEE (Japan)
in March 1926.

Thanks in advance. Rob, N3RW, a satisfied user of Yagi antennas for DXing!

So does this mean that if you have a Bronco, station wagon, hatchback
or other similar vehicle you can't even legally take one home from the
store? Sounds like a stupid point but when you give it some thought...

Besides, as I understand it, a radar detector is just a radio receiver
tuned to certain frequencies. Seems strange that a state can decide
what you can and can't listen to. Next they will probably ban all NTSC
TV frequencies to help out the cable industry.

SILVER SPRING, MD JUNE 13, 1992 BID:$ANS-165.01
TO ALL RADIO AMATEURS BT

DOVE Speech Development and Testing Continues

The DOVE software team has reset the DOVE spacecraft to the ROM and is reloading the startup software on S band. After it's return to 145.825 MHz in the next couple of days, the command stations will be doing data dumps to try to find the software bug. The next voice test load will alternate between the original voice message program and a DSP program for the DOVE Voice CPU, which is a simple direct digital synthesis oscillator. It will be generating a sine wave through the digital to analog converter. These tests are to assure us that all the hardware is functioning properly after being dormant for over two years, and to test our "work-arounds" for several compromises and faults in the way DOVE was implemented and the other faults that have been detailed elsewhere. After this process is completed the software development team will implement the file system, and upload large files of digitized waveforms, not all of them being speech. A few surprises from DOVE's owner, PY2BJO, are in store.

STS-50 SAREX INFORMATION

HR AMSAT NEWS SERVICE BULLETIN 165.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 13, 1992 BID:$ANS-165.02
TO ALL RADIO AMATEURS BT

STS-50 SAREX Mission Update

The next Shuttle Amateur Radio Experiment (SAREX) mission for 1992 is now on the launch pad! This flight, designated STS-50/USML, will perform materials science studies on the Space Shuttle Columbia. STS-50 represents the first Extended Duration Orbiter (EDO) spacelab mission. As such, the shuttle crew will work "around-the-clock" for a record breaking 13 day mission. On-board the Columbia will be newly licensed hams Commander Dick Richards (KB5SIW) and Mission Specialist Ellen Baker (KB5SIX). Launch is planned to occur no earlier than June 25 at 16:07 UTC. A nominal injection will place Columbia 140 nautical miles high with a 28.5 degree orbital inclination. SAREX capabilities for this mission include operations on 2-

meter voice, packet radio, and SSTV. In addition, a 70 cm "receive only" FSTV station will be set-up to receive video from pre-selected stations on the Earth. The Shuttle downlink frequency for all contacts (voice, packet and SSTV) will be 145.550 MHz. Voice uplink frequencies will be identical to those used on the STS-45 SAREX flight. These are: 144.95 MHz, 144.97 MHz and 144.91 MHz except for Europe which will use 144.80 MHz, 144.75 MHz and 144.70 MHz. The prime voice callsign is KB5SIW. To connect to the packet radio robot station on Columbia, use the callsign W5RRR-1. For SSTV operations, the shuttle crew will use the callsign W5RRR/S. For this mission, the uplink frequency for packet radio and SSTV is 144.95 MHz. A copy of the prelaunch Keplerian elements is given below. For more information on SAREX, in general, see the March/April 1992 and the March 1990 issues of the AMSAT Journal.

John Champa (K8OCL) Resigns AMSAT-NA Board-of-Director (BOD) Seat

In a surprise move last week, John Champa (K8OCL) resigned his seat on the AMSAT-NA Board of Directors (BOD) and withdrew his nomination for the upcoming BoD election.

John is also the Editor of the R. Myers Communications publication OSR, and it is understood that he will continue in that role.

In his letter to AMSAT-NA Headquarters, Dr. Champa stated that he wanted to devote more of his time to AMSAT technical pursuits. He is associated with the Detroit OSCAR Users Group (DOUG) and has been serving as AMSAT liaison and consultant to the SEDS (Students for the Exploration and Development of Space). It is understood that he will continue in these roles also.

AO-13 Operational News from AO-13 Command Stations: PART I

Orientation News 1992 Jun 10 - Jul 20

The magnetorquing operation to re-orient AO-13 is now complete, with the new attitude longitude and latitude ALON/ALAT (BLON/BLAT) = 210/1 degrees.

The next re-orientation will commence on July 20 from 210/0 to 150/0 via an interim attitude of 180/15 and will take about 10 days. With the antennas pointing 15 degrees out of the orbit plane, transponder performance will be relatively poor. When at 150/0, which will last until Sep 21, apogee access for Southern Hemisphere stations will be all but useless. There is absolutely nothing we can do about this, other than reposition the Sun's orbit. This is beyond AMSAT's budget at present.

AO-13 Operational News from AO-13 Command Stations: PART II

Schedule News 1992 Jun 10 - Sep 21

The published "210/0" schedule is now in place with alternate day Mode B/L and S operation. The Mode-S control problem that turned the S beacon off after only 1 MA unit during Mode-L has been fixed.

Kindly note that if power budget problems ever arise, Mode-S is usually the first thing to be turned off to compensate, without notice. Similarly, transient departures from the published schedules are sometimes needed for command purposes, particularly during magnetorquing days.

From Jun 29 the solar illumination will be insufficient to sustain modes JL and S, so Mode B will be continuous through to Aug 17.

By convention, schedules are only announced one "season" in advance. Thus, from August 17 Mode B, JL and S operations resume with the following:

AO-13 Transponder Schedule 1992 Aug 17 - Sep 21

Mode-B : MA 0 to MA 40 ! from 1992 Aug 17 until Sep 21
Mode-S : MA 40 to MA 50 !<- S transponder; B trsp. is OFF!
Mode-LS : MA 50 to MA 55 !<- S beacon + L transponder
Mode-JL : MA 55 to MA 70 ! This schedule operates
Mode-B : MA 70 to MA 256 ! every orbit, every day.
Omnis : MA 160 to MA 10 ! Alon/Alat 150/0
Please DON'T uplink to Mode-B MA 40-50; interferes with Mode S.

This schedule, which reverts to the old every-day routine, was determined on 1992 May 27 at a meeting of AO-13 Command Stations during the Phase 3D Design Conference held in Marburg, Germany.

The decision to discontinue the experimental alternate day schedule is dictated entirely by spacecraft security.

The primary AO-13 management requirement is to maintain the health of the spacecraft AND to provide the best operating conditions for users of the spacecraft's transponders. It is always a juggling act for the Command Stations to try and balance these often opposed goals. Faced with deciding between health versus performance the Command Stations will always choose the conservative approach and give priority to the health issues.

The extended 2.25 hour long Mode J/L/S periods drained the battery too heavily, resulting in uncomfortably low battery charge and regularly tripped under-voltage software "fuses." This practice is undesirable and has to be avoided.

A second reason is that commanding on Mode-B is virtually impossible due to suspected radar interference on 70cm; alternate days of Mode B therefore reduced the Command Stations' daily control capability by 50%, and we found this an untenable situation to be in.

TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on AO-13 on a downlink frequency of 145.950 MHz and Mode J/L on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt

20-Jun-92 2000 B 146 WA5ZIB WJ9F
5-Jul-92 0200 B 118 W9ODI N7NQM
11-Jul-92 2300 B 225 W5IU WA5ZIB

Guest commentators are planned. Join the net if you have questions. In the unlikely event that either the NCS or the alternate do not call on frequency, any participant is invited to act as net control.

****

Slow Scan Television on AO-13

The SSTV net will meet on a downlink frequency of 145.925, Mode B at
MA 165, UTC Sundays. Also try Mode J, UTC Saturdays at MA 165, on a
downlink frequency of 435.980. Try the various AMSAT nets for
scheduling at other times.

SILVER SPRING, MD JUNE 13, 1992 BID:$ANS-165.11
TO ALL RADIO AMATEURS BT

RUDAK BBS back!

Since this morning the RUDAK-Mailbox (RBBS) is again operational. During the late night (local time) Gerhard DG2CV successfully uploaded the software again after RUDAK/AO21 was re-activated on Thursday by the INFORMATOR-1 command station. We hope that RUDAK will now stay ON for a longer period but there may be exceptions due to continuing problems with the Main Satellite. However, the main problem seems to have been fixed and together with AMSAT-U and the INFORMATOR-1 command station we are investigating a procedure to fix the remaining problems. The RUDAK hardware is still functioning 100% OK!

About radar detectors being just a radio receiver, and as receiver could it be controlled by a state? A couple of years ago I had a run in with the Oklahoma State Police Dept. Seems they didn't like me tuned the "their" frequency. They confinscated my HT, read me my rights, and just about hauled me to jail for "interfering with police communications". Hell, I did was have my HT on 155.43 Mhz. I called the FCC enforcement branch in Dallas. I talked with the chief engineer in charge of enforcement. He flat out said that NO state has the right to control ANY receiver of ANY type. I even mentioned radar detectors as an example and he said the state had no rights controlling a communications device (any device that exchanged information). The only reasons that the laws still stood was no one has taken it to the Supreme Court. Even under the current political climate, there's a good chance that radar detector laws would fall under FCC juridiction.
Of course who has the +$1,000,000 it cost to take a case to the Supreme Court over a $100 radar detector.
BTW, OSUPD dropped the case for "lack of evidence" and gave me the radio 6 months later. Let 'em try it again now that I know how the law reads.
-Steve

1. Indiana law prohibits the possesion of a radio _capable_ of receiving police frequencies in your car or on you person while in public. Exceptions are made for volunteer firemen, members of the press, holders of permits issued by a police chief, and amateur radio operators. Since it is fairly easy to get an amateur radio license these days (codeless Technician), why get your license and be legal?

2. Since Indiana law prohibits the possesion of a radio _capable_ of receiving police frequencies, your scanner would still violate the law even if you erased all police frequenices from it if stopped.

This is a thread that's been beaten to death in the past, and I thought
it best to nip it in the bud if possible. It's not the states telling
you what you can listen to; rather, they're telling you what you can
and can't do in a motor vehicle. Big difference. (Hey, I don't like
it any more than you do, but I reckon they *can* define the rules for
driving, right?)

>a crystal change does the deed, then tack on an amplifier stage.
>For two meter transmit, you follow the phone output with a tripler
>and amplifier. For receive, you triple the receiver chip LO and feed

Gary,

Did you really do this, or were you saying "[it should be easy to]
follow the phone output with a..." I was thinking that if
you follow an FM transmitter with a tripler, your deviation
approximately triples, no?

I really like to see mass-produced stuff converted to the ham bands,
like the baby monitors, cordless phones... that's what experimentation
is all about!

Regards, and 73,
Dave

I had a similar non-sucky experience, (that is, a reasonable airport
security person let me pass without a hassle); although I wonder if
posting the details might be a Bad Idea in case someday, someone
says "Yeah, I heard that you can disguise (stuff) as a (certain
kind of walkie/battery pack/antenna) without getting caught!"

What a sick world.

On the other hand, ain't it great when you travel to a different part
of the world and you key up a repeater and make a new friend? As if
you are both long-time buddies? It sort of makes up for it!

Almost. :(

Regards, and 73,
Dave

3447. Open letter to Gary, KE4ZV (too long)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 00:17:19 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9206150017.AA25258@cmr.ncsl.nist.gov>
Source record: 288618

This is a very open letter to Gary KE4ZV:

Gary, you disinterest in the topics covered in "The World
Above 50 MHz" in QST and other similar monthly columns. You also claim
to be more interested in the "content" of communication than in the distance
communicated.

Let me present my "explanation" as to why you don't see your interests
being served by these columns..

The most important reason is NUMBERS. You can easily quantify grids,
countries, or states worked. Thus it is relatively easy to have "boxes"
wherein hams can compare their achievements. Tell me how to conduct a
monthly column of Operating News based on the ***content*** of communication.
What is the measure of ***information*** transfered? Not bits and bytes,
but real thoughts, understanding. Gary, what would YOU put in an Operating
News column. If you remember when Ed Tilton ran "The World Above...", the
lead material was often hardware hints and kinks. The more recent trend has
been toward discussion of policy, band planning, etc. I suspect that this
partly reflects today's reduced home-brewing activity.

One of the things that attracts me to the VHF-UHF type of weak-signal work
is that you don't have to listen to the same idiots demonstrate their poor
intellect day-after-day, as you do in some facets of VHF (FM). I'm not sure
whether a DX contact or a half-hour of typical repeater content has lower
information content. Don't get me wrong, the dog-eat-dog approach to DXing
practiced on the HF bands has ensured that I don't operate there. At VHF-UHF,
DX is more a challenge to overcome or take advantage of nature, than a fight
with competing hams.

Also, Gary, "The World Above 50 MHz" IS attempting to encourage day-in,
day-out, local and semi-local contacts, by running a "cumulative contest".
The rules give points for one contact with each station each day.
The maximum distance multiplier is earned for contacts over 2 (3?)
grid squares away (around 150-200 miles). All modes are encouraged. (I don't
know about repeaters, since they so distort the distance situation.)
My guess is that the response has been very underwhelming.

Gary, I have found the various attempts at "FM" and "Packet" columns to be
failures. I DO have interest in FM and packet. I attended the early meetings
that led to AX.25. I provided the venue for the first ARRL Digital Communica-
tions Symposium. And I HAVE been active on FM and packet (way back, not really
active now). I HAVE built, operated, and maintained a 2-m FM repeater. I HAVE
worked packet by meteor burst on 6 meters. ...

Gary, you clearly have the interest and ability; why are you wasting your time with your postings to this news group - when you could be writing a regular series for some publication? SERIOUSLY !! Is there anyone who would publish it? Would you have to "test the waters" in something like QEX?

73, Bob W3OTC

"VHF FM is a good way to contact radio hams, but it isn't really ham radio." Flame-proof suit ON.

MONDAY JUNE 15, 1992

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* STS-50 LAUNCH ADVISORY *
==========
NASA will launch Space Shuttle Columbia on a 13 day
mission on June 25, 1992. NASA officials selected the
launch date at the conclusion of the Flight Readiness
Review held today at the Kennedy Space Center, Fla.

Mission STS-50, planned to be the longest flight
to date in the Shuttle program, will carry the United
States Microgravity Laboratory-1 payload into orbit. A
Spacelab long module will serve as an in-orbit
laboratory for seven crewmembers and 31 experiments
devoted to materials science, fluid physics, combustion
science and biotechnology.

Columbia will be launched into a 184 statute mile
circular orbit inclined 28.5 degrees to the Equator from
Pad 39-A. The launch window on June 25 opens at 12:07
p.m. EDT and closes at 2:37 p.m. EDT. Columbia will end
its mission with a landing at Dryden Flight Research
Facility, Calif. The mission duration is planned for 12
days, 20 hours and 29 minutes.

Commanding the mission will be Richard Richards.
Columbia's pilot will be Ken Bowersox. Mission
specialists are Bonnie Dunbar, Ellen Baker, and Carl
Meade. Payload specialists are Larry DeLucas and Gene
Trinh.

This shuttle mission WILL include extensive SAREX operations.

* OSCAR-21 NEWS *
==========
AO-21/RS-14 was copied by KD2BD on 12-Jun-92 on 145.987 MHz transmitting
1200 bps AX.25 unnumbered information (UI) frames using BPSK modulation:

RUDAK>BEACON <UI C>:
* RUDAK-II / AMSAT OSCAR 21/ RM1
* Up: 435.016MHz (1200)
* 435.155MHz (2400)
* Mailbox=RUDAK Mheard=RUDAK-1

RUDAK>EPROM <UI>:
RUDAK-2 EPROM-Test

RUDAK>BEACON <UI C>:
RUDAK-Telemetry (09-06-12 20:46:00):
Used stack entries: 0
Uplink Carrier Detect (during last minute): 0%

A Yaesu FT-726R, MFJ-1270B, and KD2BD Pacsat Modem were used to copy
these packet frames along with an indoor antenna. AO-21 remained in
RUDAK mode for the duration of the pass. The FM voice repeater was
not in operation at this time.

* FO-20 NEWS *
==========
Fuji-OSCAR-20 normally operates its Mode JD packet radio transponder on
all orbits. During the following periods, the Mode JD transponder will
be switched off and the analog Mode JA transponder will be switched on:

17-Jun-92 03:15 UTC -to- 18-Jun-92 01:15 UTC
24-Jun-92 01:50 UTC -to- 25-Jun-92 02:10 UTC

[Info via Kazu Sakamoto, JJ1WTK]

* PACSAT NEWS *
==========
The AO-16 Command Team has announced that the weekly Wednesday
Experimenter's Day activities will take a summer break. Routine
Experimenter's Day operations will be suspended for June, July, and
August. However, the AO-16 Command Team urges all users to continue
QRP Day operations each Wednesday by limiting their uplink power to
20-25 watts EIRP.

Experimenter's Day activities will resume in September.

3450. k-factor for half-wavelength antennas and conductor size

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 02:49:13 UTC
From: jad@expert.cc.purdue.edu
Message-ID: <51426@mentor.cc.purdue.edu>
Source record: 288623
Cross-posted to: rec.radio.amateur.misc,sci.electronics

The ARRL Handbook, 1988 edition (which I own), has been an excellent reference book. However, for the frequencies I am trying to work with, the table explaining the shortening effect of wide conductors on dipole length does not cover sufficiently small ratios of wavelength to diameter.

I have a 900MHz dipole to work with. I am trying to find the shortening effect a wide member will have on the antenna's length. The table only goes down to wavelength divided by element diameter ratios of 10:1. This is fine for HF and VHF antennas, and some UHF antennas, but not this design.

What I need to know is "has anyone the formula that the ARRL used to generate figure 3 of chapter 17 (1988 edition), 'Effect of antenna diameter on length for half-wavelength resonance'?" Was this graph generated theoretically or experimentally?

Email me if you need or have this information.

Thanks in advance!

3451. Re: How does 'Trunked radio' work?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 04:30:37 UTC
From: brian@ucsd.edu
Message-ID: <11h6ddINNkee@network.ucsd.edu>
Source record: 288625

There are several kinds of trunked radio systems; I'll describe the Motorola one since that's the kind I was trained on several years ago. The others aren't too different, I'm told.

Typically there are at least 4 channels in a trunking system. They are really repeater pairs; most often in a small system, all the repeaters are at a single location on a good hill or tall building. One channel is the control channel and continously transmits digital codes (3600 baud, if I remember right). In a Motorola system, the control channel shifts between the repeaters in the system every 12 hours to even out the wear on the equipment. Larger systems (like San Diego's 14-channel trunking system) will have multiple control channels, usually spread around different sites for better coverage.

When a mobile (or portable) is first turned on, it scans all the channels in its system until it finds the control channel. (If it can't find it, you'll get an error indication.)

When you key the radio to make a transmission (after an idle period), the radio sends a quick digital request containing your unit id and the 'call group' of who you want to talk with to the trunking controller, which is listening on the input of the repeater that is the control channel at that time.

The controller selects an idle repeater channel, and then transmits a command that tells your radio to switch to that frequency. If all channels are busy, you get an error indication. All the other radios in the selected talk group will also switch to that frequency.

(A talk group may be everyone on your system, just a few units, or one specific unit. It's completely programmable.)

While the conversation continues, you'll all stay on that frequency. After a configured idle period (which can be short or long), you'll all return to the control channel, freeing up the repeater.

Whilst you're on the talk channel, a continuous subaudible digital code (63 baud? don't remember!) is sent to confirm that you're on the right channel and that you should stay there. It can also instruct you to switch to another talk channel or to return immediately to the control channel.

MDT (Mobile Data Terminals), alphanumeric pagers, and mobile status indicators (in service, out of service, man down, emergency, hijack, etc) can operate on the digital control channel without needing to allocate a talk channel, although in a busy police system, it's likely that MDTs have their own channel.

It is possible to poll a mobile to see if it's in service; it's even possible to reconfigure the mobile remotely in the more advanced systems. I see no reason to believe that it is impossible to remotely command a mobile to transmit, but I don't think that would be practical as an eavesdropping technique, since typically the microphone is out of the circuit unless the button on the mic is pushed, and because most mobiles have blab-off timers to prevent a wedged microphone from jamming a channel for long. It could be done, though.

The voice transmissions are normally standard 5 (or 3) kHz deviated FM, but they can be digitally encrypted if the system is so equipped. That's pretty much separate from the trunking function. (As a side note, the Motorola digital encryption is done by digitizing the signal using a CVSD coder doing the A/D/A conversion; as I recall, it's like a 12kb/s code. To me, it sounds really muffled - too low a sample rate for my taste. Obviously they had to do that to fit it into standard channels.)

I understand that the Johnson and G.E. systems work similarly, but don't leave the controller transmitting continuously. They may use different baud rates too.

To monitor a trunking system on a scanner, you pretty much have to program all the frequencies into your radio. In the US, you can get them from the public copy of the station license. However, if the system gets busy, and the idle homing timer is set short, you'll have a lot of trouble finding a specific conversation.

I think it would be really cool for someone to make a trunking decoder that could be attached to a scanner that would instruct it to follow a specified bunch of talk groups as the channel assignments took place. No doubt it'll cost a fortune.

In the mean time, the only technique that occurs to me is to get a used trunking radio and pursuade a radio tech to program it the same as one of the official radios. Whatta pain!
- Brian

A friend of mine is considering purchasing a Yeasu FT-890 HF rig.
He would like to know if anybody has had any experience with that radio and,
if so, what do you think about it? What do you like? What don't you like?
Is it a good buy? etc...

Please send replies via E-mail since I don't always get a chance
to read everything on here. I will summarize any responses we get. Thanks
in advance...

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 3 June 1992.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn

reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the structure we now use.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.packet is for discussions related to (surprise!) packet radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgable folks in radio digital communications can be found here, and anything in the general area is welcome.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both

rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.amateur.misc, .packet, and .policy groups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for details. You can also post to rec.radio.swap by sending email to rec-radio-swap@ucbvax.berkeley.edu; if you do it this way, be sure to include an address for responses by electronic mail, as the gateway does not automatically do so.

A Note on Crossposting
======================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

3459. Ham Stacks Announcement

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 11:55:05 UTC
From: dls@genrad.com
Message-ID: <1992Jun15.115505.9568@genrad.com>
Source record: 288633

After receiving two envelopes from prospective hams that had the wrong information (73 Amateur Radio Today has AGAIN published TWO YEAR OLD DATA), I figured it was time to repost this data. Note the new address.
Diana KC1SP

LATEST VERSIONS: Novice v3.3, Technician v3.5, General v2.3, Advanced v2.3, Extra v2.3

This is another announcement about the MacIntosh HamStacks which I have created. If you are not interested, press 'n' now.

I have created five HyperCard stacks to help people practice for the written Amateur Radio tests. There is one stack for each of Novice, Technician, General, Advanced and Extra questions. Each stack is an interactive multiple-choice test, created from the entire question pool for that class of license. The test is randomly generated, using the algorithms provided for each of the tests from ARRL, so this is a real-live simulation of the tests you will get in front of a VE. There are some print capabilities (you can print a test with a separate answer key, but it's slow. you can also print your results of how well you did, along with the accompanying correct answer key) and at the end of each test, it will tell you how well you did, allow you to review the missed questions, and allow you to take another randomly generated test. If you can consistently score over 90 on the tests, it's almost a sure guarantee that you will be able to take and pass the VE proctored test.

Note that these stacks will only work on a MacIntosh computer. HyperCard version 1.2 or later is required; they were generated with HyperCard version 1.2. Because HyperCard data is NOT stored in any ASCII form, there is no way that this data can be used on other computers, including IBM PCs, so please don't ask for the impossible. Also, I do NOT have access to email these stacks over the computerwaves, nor do I have ftp capability. There are a couple of sites which are supporting these stacks via ftp, as follows:

These stacks are supported by ftp by Charley Kline, c-kline@uiuc.edu. To access the files, type "ftp uxc.cso.uiuc.edu", log in as "anonymous", with your email address as the password. Type "binary" at the prompt, then type "cd pub/ham-radio". The five hamstacks are (eg): novice-v3.2.hqx.Z, technician-v3.3.hqx.Z, general-v2.2.hqx.Z, advanced-v2.2.hqx.Z, and extra-v2.2.hqx.Z (or similar names). To retrieve one of the files, (for example, the Novice one), type "get novice-v3.2.hqx.Z". When you're finished retrieving all the files you want, type "quit" to exit ftp. Each file must be uncompressed before moving it to the Mac: "uncompress novice-v3.2.hqx.Z". You need to use Kermit to transfer the files to the Macintosh. The files must then be un-binhexed by UnStuffit, then unstuffed by UnStuffit.

The latest versions of the stacks are shown below, and are compressed with Stuffit Classic. UnStuffit is included on the diskette. These versions include modifications for NoCode (very minor changes from v3.0 or v2.0).
Novice version 3.3
Technician version 3.5
General version 2.3
Advanced version 2.3
Extra version 2.3

If you wish to receive these PUBLIC DOMAIN stacks from me, please send me a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette. I will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, I take no responsibility for the condition of the diskette through USnail.

Thank you for your attention.

3460. Fire bottles: Screen grid bias

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 12:29:11 UTC
From: ROCH%SLUMUS.BITNET@cunyvm.cuny.edu
Message-ID: <15JUN92.09120942.0010.MUSIC@SLUMUS>
Source record: 288632

Hi Jim,

A few questions first:

What kind of plate voltage are we talking?
How much rf voltage are you applying to the control grid?
When you say you are cranking up the carrier level, do you mean plate loading?

I am not familiar with this transmitter. What kind of voltage are they applying to the top of that 100 ohm resistor in series with the 0A2? Are you sure that's 100 ohms, usually they put about 300-350 volts on the series dropping resistor, use around 10-15K, to get, what 25 mA, through that 0A2. See when that screen-grid starts drawing 12 mA, you aren't getting enough current through the 0A2 to keep it fired. You may have to drop the resistor value.

Screen current will vary wildly depending on many factors, to include, grid excitation, plate loading, screen dropping resistor... Try not to exceed the screen's power dissipation rating. Do you have a fan on that tube? Screen current will increase as more drive is applied. Watch the screen voltage as you play around. I take it that this is a SSB rig? You may want to look up the tube's specs, the handbook is very limited. How's the plate resting current?

Help Please...

Just got a MFJ 941-C Versa-Tuner II that i intend to use
with a QRP kit that I am going to build. Got it at a ham
fest and didn't come with the manual.

Does anyone have any information (suggested settings to
start with for each band--and what the sens/power meter is
all about)....Know how to use it .. but not the particulars.

thanks in advance for any help.

Correct, and pray tell, why would you want one in your home? There
illegal to have in the car. Radar detectors are a lot different than
scanners. Scanners have legitimate non-criminal use. You'd have a
hard time convincing anybody that a radar detector is good for
anything other than braeking the law. Similar laws are on the books
for posession of things like lock picks and drug paraphenalia.

At least at ARRL that's the way it works. You are required to sign a release form that, in part, states that you haven't submitted the same article elsewhere. This promise has been violated once or twice by QST authors--former QST authors, that is.

> the right to control ANY receiver of ANY type.

It's too bad that this guy is not a commissioner. As the FCC probably has the right to declare radio it's exclusive control, they haven't done so. When hams (primarily as a result of the now repealed NJ scanner law) asked for a preemtive ruling from the FCC. The commission instead suggested that the radios be modified not to receive out of band. I wouldn't hold my breath.

Just because a federal agency can preempt the localities, doesn't mean that they always will do so. There are already numerous exceptions in both the Communications and Transportation areas that I am aware of.

Sure: 20W RF energy converted to 20W light energy leaves NO RF energy. :-)

Two quick comments:
Maybe this is what you said but: the report I saw recently said
that the lighting part is nothing new but the RF shielding is.

Since the purpose of patents is supposed to be the sharing of
information and ideas it would seem that the shielding "trick"
should be no secret. Anybody seen the patent?

3468. Re: Airplane security (was Re: HTs on Airplanes)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 14:07:59 UTC
From: ron@pilot.njin.net
Message-ID: <Jun.15.10.07.59.1992.21117@pilot.njin.net>
Source record: 288640

While it doesn't seem to be a problem right now, since the security checkpoints seem to be getting lax about checking out radios and lap tops, let me suggest one thing.

Don't bother dicussing the matter with the security people if your trying to bring something through that they think is suspect. Go back to the ticket counter and get a representitive of the airline. I tried to bring a naked hard drive on as carry-on luggage (I had checked the PS/2 it went in). After explaining to security that it was not possible for me to turn it on, I went back to United and they came back and escorted me thorugh security (the United guy had to sign some log to get me through). I've had to do that one other time when I was overseas (Hong Kong), same deal, the ANA lady attached a tag to my box and I got through fine the second time.

Amusing thing though, the time I was trying to take the disk drive through and they gave me all the problems, they had bigger problems. While all this examination of the disk drive was going on, my briefcase (which also didn't get xrayed, it was full of tapes). Sat uninspected next to the supervisors podium, they never even looked at it. In addition, this was a rush trip and we headed to the airport without tickets. While my coworker went inside to stand in line to obtain tickets, I gave the skycap $5 at curbside to check the boxes for a model 80, monitor, and a 6091 monitor, as well as two suitcases to SFO.

From: gary@ke4zv.uucp
Message-ID: <1992Jun15.140941.9042@ke4zv.uucp>
Source record: 288649

In article <bpv0nk.99j@wang.com> dbushong@wang.com (Dave Bushong) writes:
>Gary,
>
>Did you really do this, or were you saying "[it should be easy to]
>follow the phone output with a..." I was thinking that if
>you follow an FM transmitter with a tripler, your deviation
>approximately triples, no?

RS ET-381 handsets. Yes I really did this. To deal with the problem
of tripled deviation, turn down the deviation of the phone. :-)
I did this cheap and dirty since there isn't a pot, I just loaded
the mic down with a resistor. Ugly, but effective. This was just
an afternooner to see if it would work. The handset wouldn't
close when I finished because of the breadboard tripler and amp.

The 6 meter conversion is slick though, looks totally stock except
for the added whip antenna salvaged from an old RC transmitter and
the PTT switch, a little red pushbutton mounted under the on-off
switch. Actually the hardest part of the whole project is figuring
out how to pry open the handset without trashing it. Cordless phones
show up at garage sales and fleamarkets all the time for $5 or less.
Often the base unit has been zapped by lightning or the nicads have
given up the ghost. Sometimes they are in perfect condition. Smashing
open a few is educational.

For the RS handset I used, from the ET-381 chronophone, there are
two phillips screws hidden under the number plate. After you remove
them, the back separates from the handset. There are two plastic
hooks at the top, don't break them. Note the output coil/antenna in
the back. This is where you connect the amp and whip. Two more phillips
screws hold the circuit board. After removing them, carefully unplug the
board from the keypad. The handset is all transistor, the only chip is
the DTMF encoder. There are three crystals, a 16.XX MHz transmit, a 36.XX
recieve, and the DTMF's 3.58 MHz. Goose up the transmit and receive crystals
and you have a six meter phone. For PTT, just break the B+ lead to the
transmitter PA transistor and route it through your PTT pushbutton.
I just used a 2N2222 that I had lying around for the PA. It's not
ideal since you only have 3.2 volts in the phone, but it makes about
70 mw. If there were room for a 9 volt battery, you could use a 2N5109
and get about half a watt, I tried this outboard, but it was too clumsy.

John,

I can appreciate your view here. I might add that not everyone was here
when this topic was beaten to death. I do not read all the posts in a group,
for example and I could miss the great comments that you added to the
discussion. Also, I noticed that this topic is being crossed posted to more
than one group, thus, what was beaten to death on one group, one can not assume
that it is of no value to another group, that in this case, deals with scanners
and issues involving their use. Just my HO. I liked they way you expressed
you opinion about "Nip it in the bud". Most people use no tact in expressing
this type of view and start a flame war :(

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 065 (OPDX.065)
June 15, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, K4CEF & Southeastern Cluster Group, ARRL, DXNL, DF4RD, WB3LHD, JH1FDP, VP2ML and the DXB for the following DX information.

3B8, MAURITIUS. 3B8CF has been very active almost daily on 10104 or 7005 kHz between 0230 to 0400z.

5T, MAURITANIA. 5T5CJ continues to be active on the WARC bands. Check 24900 kHz around 1600z, 18086 kHz around 0800z and 10106 kHz around 0730z. QSL via W4BAA (91 & 92 CB).

6 METERS. (DO NOT FORGET ABOUT THIS BAND!) There was been quite a bit of activity this week on SIX. Most of the operators were getting ready for the VHF contest (6/13-15). Stations that were active before the contest: K1LL/0 (S. Dakota), KA3B/VP5, W0OSP (N. Dakota), KA0IJS (Iowa), C6AFP, CO2KK, HH2PK, VE6AB, VP9HE and 9H3QE.

9J, ZAMBIA. Stations active this week were: 9J2BO on 14015 kHz at 1223z (QSL to W6ORD, Norm Friedman, P.O. Box 19055, Encino, CA 91416-9055), 9J2FB on 21337 kHz at 1820z (QSL to Fred Brunce, Box 20133, Kitwe, Rep. of Zambia) and 9J2SZ on 21296 kHz at 1553z (QSL via SP8DIP).

DL, GERMANY. DXNL reports that prefixes of the ex-German Dem. Rep. will be converted to individual DL callsigns (DL1....9) with a three letter suffix by the end of 1992.

FR, REUNION. FR/DF3EC/P is active from Reunion and not from Tromelin. He has been active on 18077 kHz around 0400 to 0430z and on 21025 or 14025 kHz around 1130 to 1430z. DF3EC was one of the Germans who was with Baldur (DJ6SI) on Glorioso. There still is no word on whether they are planning to add Tromelin to their itinerary.

JD1, OGASAWARA. Mikio, JA3GEP, will be signing /JD1 for a short operation from here June 15 to 17. QSL to his CBA.

JT, MONGOLIA. Ray, G3NOM, who is now active as HS0AS, will be operating as /JT1 and /JT4 from June 28 thru July 7th. After his activity in JT-land, Ray will be on the air from Kampuchea as XU1NOM starting July 29th. This operation could get cancelled due to the political situation.

OD, LEBANON. Ed, SP1MHV, is now active from here signing OD5/SP1MHV. His length of stay is unknown at this time. Ed has been active on 18130 kHz beginning about 1930z. He has also been heard on 14206 kHz around 0200z. QSL to his CBA.

P4, ARUBA. Terry, N4BWS, will be active as P4/ for two weeks. He was active on 28495 kHz around 1630z. He mentioned he will be traveling to Anguilla (VP2E) and St. Maarten (PJ7) the week of June 28 for one week. QSL via WB4CKO.

S0, WESTERN SAHARA. Yes, there is still activity from this one. S01A was active this past weekend (6/13) on 21265 kHz around 1500z. QSL via EA2JG.

TF, ICELAND. Roland, HB9FMD, is to be active from TF-land as of June 9th, but no spots have been reported on the Ohio/Penn Network yet. He is to be active until June 20th. QSL to CBA. UPDATE 6/14: Just as OPDX was going to press, Roland was reported active on 14010 kHz at 2042z.

TK, CORSICA. Ann, DL8NBH, has been active as TK/DL8NBH. Most of her activity has been on CW. She spends a lot of time on 21020 kHz, but she has also been heard on 18074, 18135 and 10105 kHz. Operating time seems to be 1330 to 1700z. Her length of stay is unknown.

V63, MICRONESIA. JQ3EEL will be active from September 4th thru the 13th. More information will be forecoming. Until then, look for V63AO on the 14226 DX net around 1200z. QSL to I. Nishimura, P.O. Box 296, Pohnpei, Federal States of Micronesia, FM 96941. V63JC has also been active on 14197 kHz around 0530z.

VQ9, CHAGOS. VQ9YA can be found on RTTY in the 20 meters band around 1700z and again around 0000 to 0230z. Both VQ9AC and VQ9TW have been heard on 21313 kHz between 1830 to 2000z at different times. VQ9AC has also been active on 21035 kHz around 1630z (QSL via N8OW).

XQ, EASTER ISLAND. XQ0YAF has been quite active on CW from Easter Island. Check 28010 kHz starting around 1530z and as late as 2000z. Look on 21015 kHz around 0015z. QSL to Henry, Box 4, Easter Island, Chile.

XU, KAMPUCHEA. Patrick who was signing F6IRF/4U, has now been assigned XU8CW. He is reportedly active every day on CW. Check 14032 kHz at 1345z, 18075 kHz at 1530z and 14235 kHz at 1400z. QSL via FD1GTR.

ZK1, NORTH COOK ISLANDS. Warwick, ZK1WL, appears to be active again from Penryn Island (part of the N. Cook group). It is beleived he may be a resident and has been active before. Check 21265 kHz around 0330z for activity. QSL to P.O. Box 855, Rarotonga, Cook Island. The length of his operation and other status, is unknown at this time.

DX TIDBITS..... At the DX Convention in New Orleans, it was reported that Tony (WA4JQS) will have the logs for the South Sandwich DXpedition..... A new Taiwan DX Net is being started on Fridays at 1500z on 14273 kHz. The net coordinator is Andy UA6BGB....

POSSIBILE NEW DXCC COUNTRIES (YU2,YU3,YU3)? Yugoslavia's republics that have proclaimed their independence are receiving world-wide recognition. With international recognition from the United States, some European countries and their admission to the United Nations, the door for them to make the criteria as new DXCC countries is now open. The republics of Croatia (YU2), Slovenia (YU3) and Bosnia-Hercegovina (YU4) may be the new countries added to the DXCC Countries List. The YU1, YU5, YU6 and YU7 will probably still count as Yugoslavia.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

In article <9206150017.AA25258@cmr.ncsl.nist.gov> rc@cmr.ncsl.nist.gov (Robert Carpenter) writes:
>This is a very open letter to Gary KE4ZV:
>
>Gary, you disinterest in the topics covered in "The World
>Above 50 MHz" in QST and other similar monthly columns. You also claim
>to be more interested in the "content" of communication than in the distance
>communicated.
>
>Let me present my "explanation" as to why you don't see your interests
>being served by these columns..
>
>The most important reason is NUMBERS. You can easily quantify grids,
>countries, or states worked. Thus it is relatively easy to have "boxes"
>wherein hams can compare their achievements. Tell me how to conduct a
>monthly column of Operating News based on the ***content*** of communication.
>What is the measure of ***information*** transfered? Not bits and bytes,
>but real thoughts, understanding. Gary, what would YOU put in an Operating
>News column. If you remember when Ed Tilton ran "The World Above...", the
>lead material was often hardware hints and kinks. The more recent trend has
>been toward discussion of policy, band planning, etc. I suspect that this
>partly reflects today's reduced home-brewing activity.

I understand that the column is a scoreboard for a *game*. I'm not even slamming the gamesters. What I'm saying is that activities above 50 MHz don't have to be a competition. Why do I even want to *score* information content? I'm pleased if it's *there* at all. I would like to talk about techniques that *facilitate* the transfer of information. That may involve high speed packet links, ATV or FAX (a picture is worth a thousand words), or some other way of increasing the information content of communications. Remember that my complaint was with the *title* of the column implying that contesting *was* the world above 50 MHz. Call it DXing Above 50 MHz and I have no complaints at all. I'd still like to see a real column promoting activities other than gaming above 50 MHz, but I don't want to change or delete your DXing column.

>One of the things that attracts me to the VHF-UHF type of weak-signal work
>is that you don't have to listen to the same idiots demonstrate their poor
>intellect day-after-day, as you do in some facets of VHF (FM). I'm not sure
>whether a DX contact or a half-hour of typical repeater content has lower
>information content. Don't get me wrong, the dog-eat-dog approach to DXing
>practiced on the HF bands has ensured that I don't operate there. At VHF-UHF,
>DX is more a challenge to overcome or take advantage of nature, than a fight

>with competing hams.

On the other hand, we often have *brilliant* exchanges of ideas on *my*
repeater, after all *I'm* involved. :-) :-) All I'm saying is that the
communications part of radio communications is often neglected by writers
in our magazines. DXing is the ultimate in contentless communications.
It's fine for the gamesters who feel that they *must* engage in a competitive
activity, but the rest of us are pleased if our radio experiments enable
a little *intelligence* to be exchanged.

>Also, Gary, "The World Above 50 MHz" IS attempting to encourage day-in,
>day-out, local and semi-local contacts, by running a "cumulative contest".
>The rules give points for one contact with each station each day.
>The maximum distance multiplier is earned for contacts over 2 (3?)
>grid squares away (around 150-200 miles). All modes are encouraged. (I don't
>know about repeaters, since they so distort the distance situation.)
>My guess is that the response has been very underwhelming.

More gaming.

>Gary, you clearly have the interest and ability; why are you wasting your time
>with your postings to this news group - when you could be writing a regular
>series for some publication? SERIOUSLY !! Is there anyone who would
>publish it? Would you have to "test the waters" in something like QEX?

I *am* preparing articles for the mags, but the lead time is very long.
I'm here a lot because I like the immediate feedback and exchange of
views that electronic media allow. That immediacy is even greater with
live amateur contacts, if we're willing to invest some content into
them.

>"VHF FM is a good way to contact radio hams, but it isn't really ham radio."
> Flame-proof suit ON.

Naturally I disagree. It *can* be dull and boring, but only if *we* are
dull and boring. Communications by radio is our business, to conduct it
we have to *communicate*. Producing systems that facilitate better
communications is our charter. Note that better means better communication
of content not just detection of RF for score.

>amateur radio growth stopped when incentive licensing came in and all
>the then American equipment manufacturers went out of the ham business
>within a few years (except Collins, but they dried up rather quickly
>afterwards).

Let me say first that I think Incentive Licensing (IL) was a bad idea.
It added little or nothing of value to ham radio and managed to anger
a lot of people--for good reason. But I don't buy the argument that
it was responsible for any significant loss of growth in the amateur
ranks. Even less do I think it had anything to do with the demise of US
equipment manufacturers. Keep in mind that at the same time US amateur
manufacturers were dying out, so were major US *consumer* electronics
manufacturers, and for much the same reasons: offshore competition
(initially Japanese) provided lower-cost products that were more
attuned to the wants and needs of the consumer. While it is true that
this all occurred at about the same time that IL came into being,
simultaneity doesn't imply causality. I've seen no compelling argument
that IL and the loss of US amateur manufacturers are related. And I'd
be curious to know how the Japanese manufacturers managed to flourish
in a market that IL had supposedly destroyed.

Now, about the growth question. I'm sure that IL had *some* effect
on growth, at least early on. But it's unclear how much. It *is*
true that after IL came into being in 1967 (privileges actually changed
in 1968 and 1969), growth was slow, it's also true that growth had
slowed *before* IL. From FCC PRB figures, here are the number of
licensed hams, 1965 to 1982:

1965 260,301
1966 255,952
1967 256,998
1968 256,546

1969 264,601
1970 263,918
1971 264,374
1972 262,093
1973 253,357
1974 256,264
1975 260,091
1976 290,251
1977 328,648
1978 356,336
1979 373,779
1980 393,353
1981 398,829
1982 410,304

Note that the biggest increase in the 1965-1975 decade occurred during 1969, just after IL took effect.

In 1955 there were (esimated) 150,000 amateurs. Obviously there was massive growth between 1955-1965. What caused that growth to slow? I don't know. It would take a serious scientific study to find out. But it *did* slow, and *before* IL came into being. So to argue that IL was responsible is ludicrous. One other interesting item from the data is that there was a growth spurt in the late 70's (sometimes known as "the CB boom"). Since there were no significant changes to the IL structure during this period, it's hard to square the numbers with the theory that IL was responsible for "two decades of stagnation."

This is pretty much a dead horse, of course, and it probably needs no further beating. But I thought it might interest some of the net readers.

I've got one in my car. Mine was new, and if it had a manual,
it didn't have much of one. I just set the inductor switch so
that I get maximum signal on receive and then just fiddle with
the knobs for minimum SWR. The thing just insn't that complicated.
If you have any specific questions, let me know. I'm sure I've
got thew few pages that came with it filed somewhere, I suppose
faxing it isn't out of the question.

One warning, be careful in hooking up the dial light (theres a
mini phonejack on the back). It is not very well (i.e. not at all)
isolated from the RF sections of the thing.

-Ron

>them. Whether this is true or not, I don't know.

I have had some experiences that would tend to indicate that
Nickel Hydride cells have a high self discharge rate. Certainly higher
than Nickel Cadmium. But I am not really sure if the cells we found to
be flat when we needed them had trully been fully charged. We are
running tests to see if they do tend to self discharge faster than
NiCads.

I have the spec sheet for the Sanyo AA cell Nickel Hydride cell
in front of me. The self discharge curve indicates that when stored at
20 oC the cell should retain 60% capacity after 60 days. From memory,
this is about the same as NiCads.

But these curves are "Measured in the lab" and may not be
anywhere near the same in real life.

When I find out more about this, I will post here.

Note: Nickel Hydride batteries offer twice the capacity of NiCads, they
are also less toxic (No nasty Cadmium). The drawback is they cost 3-4
times more than NiCads. Hopefully as more companies make them and the
market expands, they will approach the cost of NiCads. At that point
they will replace them in the marketplace.

3479. W2A wide band receiver info needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 16:34:32 UTC
From: baxter@kuhub.cc.ukans.edu
Message-ID: <1992Jun15.113435.40792@kuhub.cc.ukans.edu>
Source record: 288646

Can anyone post their impressions of how well the W2A works receiving in the out-of-band segments. What type of frequency coverage are you getting out-of-band? Does the radio cover the 800 mhz range very well or is the receiver dead in this area?

Also, any mods, such as expanding the receiver and xmitter would be appreciated.

Well, Tony, you're right, of course. Shouldn't stifle freedom of
expression, should we! :-)

Guess it would be appropriate to amplify my comment by saying that there
are a *number* of activities that are prohibited in motor vehicles which
we otherwise have the right to do, such as watching TV, reading books,
etc., etc.

Point is -- and I agree with Eric about defending our rights -- that
I'm perfectly happy to have some restrictions against what we can do
while we're driving (although it *does* take some of the fun out of
looking down from an 18-wheeler, I should imagine!) (double ;-))

*----
Your english is fine, but your understanding of the IBM parallel port
isn't. It's not designed to source current to power external devices,
and the power lines on Centronics type printers that go to the parallel
port are limited by spec. to 50 ma. There is no bipolar supply
available on the parallel port in any case.

>my scanner. I want to carry my scanner mobile in the car, but it is
>illegal to receive police frequencies in Indiana.

Just so we don't make any false assumptions.....

Here is the Indiana Statute as I have it, accurate unless it has been
changed since I got a copy.....

It falls under a title of "Interference With Government"

35-44-3-12 Unlawful use of a police radio; exemptions; "portable
police radio" defined

Sec. 12.(a) A person who knowingly or intentionally posesses a portable
police radio commits unlawful use of a police radio, a Class B
misdemeanor.

(b) This section does not apply to:

(1) a governmental entity;

(2) a regularly employed law officer;

(3) a common carrier of persons for hire whose vehicles
are used in emergency service;

(4) a public service or utility company whose vehicles
are used in emergency service;

(5) a person who has written permission from the chief
executive officer of a law enforcement agency to posess
a portable police radio;

(6) a person who holds an amateur radio license issued
by the Federal Communications Commission;

(7) a person who uses a portable police radio only in his
dwelling or place of business;

(8) a person:

(a) who is regularly engaged in newsgathering
activities;

(b) who is employed by a newspaper qualified to
receive legal advertisements under IC 5-3-1,
a wire service, or a licensed commercial or
public radio or television station; and

(c) whose name is furnished by his employer to the
chief executive officer of a law enforcement
agency in the county in which the employer's
principal office is located; or

(9) a person engaged in the business of manufacturing
or selling portable police radios.

(c) "Portable Police Radio" means a radio receiving set that is
capable of receiving signals transmitted on frequencies assigned
by the Federal Communications Commission for police emergency
purposes and that:

(1) can be installed, maintained, or operated in a
vehicle; or

(2) can be operated while it is being carried by an
individual.

The term does not include a radio designed for use only in a dwelling.
As added by Acts 1977, P.L.342, Sec.1

That is the upshot of it, for Indiana.

>tuned to certain frequencies. Seems strange that a state can decide
>what you can and can't listen to. Next they will probably ban all NTSC
>TV frequencies to help out the cable industry.

>Eric

Well, I don't know (personally) ALL the legal issues or cases
surrounding this law in Indiana, I am pretty sure that there have been
precious few prosecutions over it. My feeling is that they tend
to treat this as a secondary matter, i.e., if you go to the scene of
an accident and make a pain in the ass out of yourself, it is a way for
the cops to get you AWAY from the scene. They arrest you for violation
of the scanner law and haul your ass away.

I've known LOTS of people who didn't fall into the excepted categories
that DID have scanners in their cars, and not one of them ever got arrested
for it. Generally speaking, the cops have better things to do with their
time than to go looking for them. I don't personally condone violating
the law, mind you.

If you are going to do so, though, don't be stupid about it.
Stay out of the way of them, and you and the cops will get along pretty
well.

>chief engineer in charge of enforcement. He flat out said that NO state has
>the right to control ANY receiver of ANY type. I even mentioned radar
>detectors as an example and he said the state had no rights controlling a
>communications device (any device that exchanged information). The only
>reasons that the laws still stood was no one has taken it to the Supreme Court.

Indeed, Section 605 of the Communications Act of 1934 states
that you can listen to whatever you want - BUT, you cannot divulge the
contents of any communications that isn't related to broadcasts, amateur
radio, or ships in distress (something along those lines). Of course,
the Electronic Communications Privacy Act of 1986 (or whatever year)
came along an changed that with reference to Cellular Telephones, at
least so far.....

IMHO, the ECPA is one of the worst abortions of law ever sent
down by a US governing body.

3489. MFJ baluns, was: MFJ Versa-Tuner II

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 18:53:15 UTC
From: lockwood@acidqueen.Eng.Sun.COM
Message-ID: <l3pporINNcb8@smli.Eng.Sun.COM>
Source record: 288657

I guess I read too much or maybe take things waaay too literally.

In the excellent ARRL Antenna Handbook section on baluns, there is
a figure that shows various current and voltage baluns that do
1:1 and 4:1 transformations.

Curiously, the drawing of the 1:1 current balun is exactly the same
as the drawing of the 4:1 current balun in my MFJ tuner instruction
sheet.

The configuration of each is identical....the center conductor current
passes through one winding of the balun on its way to an antenna
terminal, while the other winding is grounded at one end and is an
antenna terminal at the other.

What gives? Is the MFJ balun really a 1:1?

Confused as always,

Jim Lockwood - KM6NK

>don' t know if this is cause for alarm, but one side effect it has is
>that the increase in current is enough to cause the 0A2 voltage to dip
>below that necessary to sustain regulation. This strikes me as a Bad
>Thing.
>Not understanding tube technology especially well, this leads me to
>wonder about several things:
>1. The impression the Handbook gives me is that the screen current is
>or should be constant and its exact value is a characteristic of a
>particular tube type. Is this, in fact, true?

No. My '64 Handbook is at home, but the handy '84 Handbook (in the HF Transmitting chapter) says that the screen current varies widely with both excitation and loading (increased excitation leading to increased screen current, just as you see).

When the screen voltage starts dropping, the power dissipated in the screen should be limited, so it may be good that the 0A2 is no longer regulating at that current (but this seems suspect to me).

>3. Assuming that some variance in screen current isn't cause for alarm,
>should I be concerned about the fact that I"m seeing a value that is
>> 2X the spec in the handbook?

Possibly. The screen grid isn't intended to handle significant power, and can be rapidly damaged. On the other hand, the 5mA figure is probably just a typical value and may have nothing to do with the maximum safe screen current.

I don't remember what voltage the 0A2 regulates at, but if it is 90V, the power at 12mA is 1.08 watts; the Handbook lits the maximum safe screen power dissipation as 3.2 watts for a 6DQ5, so this should be alright. The '84 Handbook also lists 12mA as the "typical" screen current, so maybe you just need a new book instead of a new tube :-).

3491. NiCd's for Moli's??

3492. OKDXA

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-15 19:14:30 UTC
From: beams@norvax.UUCP
Message-ID: <761@norvax.UUCP>
Source record: 288531

V73CT was on 15 meters this past weekend, and I was lucky enough to get a report from him. He said to "QSL via OKDXA," which I take to be the Oklahoma DX Association. I looked through the resources I had at hand ('92 Callbooks, a copy of the W6GO/K6HHD List, and some back issues of QST) and didn't find any mention of "OKDXA." Does anyone in the net community know what the OKDXA is and where to write them?

Reply by e-mail appreciated--the SysAdmin just got back from his second surgery and still hasn't done anything about getting this newsgroup forwarded to us.

Thanks much!

73, Dave KK9Y

3499. AZDEN PCS-4000 mobile 2m rig - need info...

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-16 00:02:25 UTC
From: charles@greyrock.mso.colostate.edu
Message-ID: <CHARLES.92Jun15190227@greyrock.greyrock.mso.colostate.edu>
Source record: 288673

Yesterday I completed my Tech. no-code license. Well, upon coming home a friend of mine approached and congratulated me with the use of an AZDEN PCS-4000 2m mobile rig. Although it's not a handheld it is a 2m rig. Can someone help me out with the operation of this rig? My friend had absolutely no documention for this at all.

Eventually I would like to get a handheld. I know this has got to be an FAQ, but I didn't find it in the listings. Can someone make some recommendations about what a good handheld rig is?

Thanks for the help,

Charles

3500. Information concerning Severe Weather classes...

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-16 00:05:48 UTC
From: charles@greyrock.mso.colostate.edu
Message-ID: <CHARLES.92Jun15190548@greyrock.greyrock.mso.colostate.edu>
Source record: 288674

I recently passed my HAM radio test and would like to get involved in
weather tracking. I understand there are some classes. Can someone
point me in the right direction for the severe weather classes in
Northern Colorado?

thanks for the help,

Charles

I have an X-band transmitter in my car. Possession is legal.
Since I have license privs on that frequency, use is legal too. I
think that having the capability to monitor my own transmissions
would count as a legal use of a 10GHz receiver.

-
- Guess it would be appropriate to amplify my comment by saying that there
- are a *number* of activities that are prohibited in motor vehicles which
- we otherwise have the right to do, such as watching TV, reading books,
- etc., etc.

Agreed. However the restriction on such activities is because
of safety concerns - the driver should be watching the road, not tv.
Note that there are no restrictions on passengers watching television
or reading - why can't they `operate' the X/K-band receiver? Too, it
is completely legal to have a tv or book in the car, as long as the
driver isn't using it while driving. With scanners and radar detectors,
some states ban not only the use, but possession as well. Finally, and
here's where your argument really breaks down, it is completely legal
to listen to a 3m FM receiver while driving - why the restrictions on
different freqencies? Hint: Driver safety is not an issue.

- Point is -- and I agree with Eric about defending our rights -- that
- I'm perfectly happy to have some restrictions against what we can do
- while we're driving (although it *does* take some of the fun out of

Again, why shouldn't a _passenger_ be able to use a radar
detector or scanner? The only explanation I can come up with is
anal-retentive legislators, but I may be missing something...

Audio quality and level on Let's Talk Radio varies over the lot.
Sometimes narrow audio works best, sometimes the signal is so
over-deviated that wide b/w is grossly distorted. Maybe somebody
could donate them some old DBX limiters.

> driving, right?)

Agreed, it has been beaten to death, but there is one aspect that
I haven't seen mentioned yet. Most states have wht are called
"reciprocal agreements" with other states where traffic laws are
concerned (this is why your drivers license is good in other
states). Part of these agreements usually includes a clause that a
car licensed in any state is subject to the equipment laws and
restrictions of the state it's licensed in *only*. A case in point
is that Texas (at least at one time) did not require "safety
chains" on the tow bar used for towing vehicles, while many other
states did. Drivers from Texas were cited by other states for not
having the chains, but it was always thrown out of court because a
car registered in Texas was *not* subject to the laws of other
states requiring the chains. Since the law here comes under the
vehicle codes, cars registered in other states should not be
subject to this law unless there is something in the reciprocal
agreements addressing this, which I doubt.

Well, a passenger *should* be able to use a radar detector, of course . . . as should the driver. I wasn't *defending* the states' position in banning radar/scanner receivers in automobiles, only pointing out that their ill-advised policies are being carried out as motor vehicle regulations, not communications law, so there's little point (except to the extent it makes us feel better) in complaining that our rights are being violated. If we want to drive a car, I'm 'fraid we have to do it under the conditions set by the DMV. (Disclaimer . . . I never said I *liked* it!)

>"They can take away my radio when they pry it from my cold, dead
>fingers."

Right. I can see both of you guys now. In the headlines. "Amateur
radio operator shot while resisting arrest." Maybe you can have your
headstone made up ahead of time.

Oh yes... meanwhile someone is holding up a liquor store, but since
the cops are arresting scanner owners.......

Or how about this: I borrow an image scanner from work to scan in
some documents for OCR. I get stopped at a sobriety checkpoint on
the way home, and the cop says, "What's that?" I say, "A scanner."

"Up against the wall, fatso."

"No, not that kind of scanner!" (Whump * wack * thump * bam * bam * bam)
(Anyone got a video camera handy?)

I guess the "no scanner" laws are to keep criminals from listening to
the cops while the criminals perpetrate something. Say, that's a
deterrent. I wonder how it's working. I'll be right back, I have
to go get the paper to see if crime has stopped.

I'm back. Crime hasn't stopped, but the cops did kill someone in order
to pry his cold, dead fingers off his radio.

Well, that's a reasonable compromise. *NOT*

I noticed that the AES catalog lists the 711 vhf rig, but not the matching 811 uhf.

I would like to buy an 811 to go with my 711. Has Kenwood discontinued it? Do any other mail order houses still have it?

I have no interest in the multiband satellite rig; I prefer seperate rigs for each band.

It seems just about the time that it would have taken for all those
people who hurried up and got their licences just before the new rules
took effect to be counted. It would be interesting to know just how
much of that increase was people who did indeed just beat the IL
deadline.

WRONG! The laws about watching TV, reading books, etc. etc. only cover what the OPERATOR (driver) can do in a _moving_ vehicle. This is to prevent undue distraction.

The laws specifically specify having a radar detector in (or on?) a vehicle, and/or having a receiver capable of picking up police broadcasts. a fair law to restrict distractions would forbid use of ANY receiver (e.g. AM/FM broadcast) such that it can distract the driver. There is NO LEGITIMATE REASON for a law to bar a _passenger_ from using a scanner with headphones, or to bar mounting a radar detector so only the _passenger_ can see it.

Most, if not all, states allow mounting a TV set as long as the screen is NOT visible to the driver (a friend of mine has a van with a TV in the ceiling right in front of the back seat, such that the driver cannot see it)

>authors--former QST authors, that is.

It is customary to either give a given magazine an exclusive up to the
publication date or disclose where else the article has been published.
Anything beyond that including any releases to publish beyond the one
instance - such as in reprints - is subject to negotiation and costs
extra. At least for popular authors.

Someone sent me ARRL's rates. (thanks.) As I expected, it is at the bottom
of the barrel. Probably OK for the occasional hobbyist writer but
certainly not enough to spur a good writer to consider regular writing.
I could just guess what kind of release they'd want. Oh well.

The way to do this is to use one of the Maxon (or Intersil) low power
voltage mirror chips in order to develop the -5 volts. Sufficient
power can be robbed from an unused handshake pin. 50 mils is more
than enough to run a DAC0808.

>In the GSB-100, the screen bias is derived from the 0A2 shunt regulator
>through a 100 ohm resistor.
>What I'm seeing, as I crank up the carrier level while tuning

No. My '64 Handbook is at home, but the handy '84 Handbook (in the HF Transmitting chapter) says that the screen current varies widely with both excitation and loading (increased excitation leading to increased screen current, just as you see).

When the screen voltage starts dropping, the power dissipated in the screen should be limited, so it may be good that the 0A2 is no longer regulating at that current (but this seems suspect to me).

I don't remember what voltage the 0A2 regulates at, but if it is 90V, the power at 12mA is 1.08 watts; the Handbook lits the maximum safe screen power dissipation as 3.2 watts for a 6DQ5, so this should be alright. The '84 Handbook also lists 12mA as the "typical" screen current, so maybe you just need a new book instead of a new tube :-).

The OA2 regulates at about 150 volts with a nice purple glow.

I wonder if anybody has any good SPICE models for RF devices, both low power (2N5179, 3866, 4427 etc) and higher power, particularly VHF bipolars, with around 15W RF capability. I have a model for the MRF136 FET which appears to work extremely well, but would like to compare circuit operation with that of a bipolar device, and to be able to accurately simulate driver stages.

Any help greatly appreciated,

73 - Simon G0GWA.

I had a fascinating experience yesterday when I had a QSO with a young ham on his 9th birthday. He has recently received his General class license and I was his first RTTY QSO. He has just finished the third grade and will go into fourth grade in the fall. His spelling is better than many adults I have worked on RTTY and AMTOR. His typing is slow, but accurate.

I am very impressed that a child of that age can type, let alone become a general class ham. I am wondering whether he is a prodigy - a Mozart or Norbert Wiener - or alternatively, whether I am underestimating how much a many young children are capable of doing.

I think it would be an invasion of privacy to publish his identity. If anyone has a good reason to want it, please E-Mail to me.

Congratulations on your selection of Yagi and Uda as the subjects for your dissertation. I don't know much about them, but I do know a bit about Japanese tradition and practices. I think you may be missing the most interesting aspect of the invention of the "Yagi" antenna.

The real inventor was Uda. Yagi was Uda's "sensei" -- i.e. his senior, teacher, mentor, and professor. In the Japanese culture, the sensei is due all honors and the pupil will always defer to him. Of course, some of this occurs in this country, as well, when a faculty advisor's name often appears on a research paper as co-author. But, I believe it is the usual practice in this country to put his name last, not first. (Correct me if I am wrong!) But this antenna was originally known as the "Yagi-Uda" antenna, and through the years the latter name has been dropped. From an American point of view, it should be called the "Uda antenna".

3519. Logging software wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-16 11:39:30 UTC
From: penneys@pecan.cns.udel.edu
Message-ID: <1992Jun16.113930.16416@udel.edu>
Source record: 288543

Software for logging and generation of QSL labels sought.

Don't need awards tracking or management; want editable and searchable records;
ability to import and export data, changeable output format for labels.
Beam headings would be nice.Ability to interface with PK232, TS440S also nice b
but not vital.

I use XT clone with 640 meg, and Mac Plus, both with hard disk. Mac is usually on TNC for packet. I run CT as well.

Have looked at DXLog and Hyperlog.

Welcome all comments.

Tnx Bob WN3K

3520. Another letter to Gary

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-16 12:08:33 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9206161209.AA01790@cmr.ncsl.nist.gov>
Source record: 288544

Gary,

I think the main point of my too-long "open letter" to you was that the activites you enjoy do not lend themselves to an operating-news type of column such as "The World Above ..." The nearest would be the monthly NCS traffic totals found the the SCMs' reports -boorrriiinng to even me.
As far as the name of the column is concerned, except for a change from "Mc" to "MHz", the name has been constant since the beginning of time. I certainly see your point and could tolerate a name-change.

BTW, I don't see much high-tech about amateur VHF-FM. Repeaters, and linked repeaters, must be at least a generation old. What else is new ... ? Now I WILL admit that ham packet radio is demonstrating practical solutions to many REAL problems: addressing, protocol implementations, and the like. Most ham packet seems to be FAILING at up-to-date RF and modulation techniques. Which just shows that RF engineering/design/construction requires a lot more engineering education (and test gear) than protocols and software.
Only a few, for example W6GN, seem to be pushing the RF front - but they never appear in QST. Is this because of a policy of addressing the mag to the mass-market/beginner?

I REALLY pity the younger ham. Nearly every place they can (afford to) live essentially forbids HF, weak-signal VHF/UHF, and microwave work, by means of antenna restrictions. This leaves FM-repeaters, and packet as the about ONLY practical outlet for many hams, sigh... I encourage the League to continue to do ALL it can in the fight against "city hall" and the NIBYs over draconian antenna restrictions. I would guess that ALL newer housing developments within 40 km (25 miles) of me forbid antennas. Should the League undertake/encourage a project to encourage the development of good residential "stealth" antennas?

Enough from me, already.

73, Bob W3OTC

[I hate to get this started up again, but I want to respond to some of Jon's points. Please hit N now if you don't want to see this.]

In article <162@arrl.org> jbloom@arrl.org (Jon Bloom) writes:
>
>Let me say first that I think Incentive Licensing (IL) was a bad idea.
>It added little or nothing of value to ham radio and managed to anger
>a lot of people--for good reason.

Absolutely true. Not only did it anger people, but many stopped Elmering prospective hams. I watched three clubs die over this issue. Clubs were the primary recruiting tool for new amateurs during this period. Many sponsored high school clubs and held regular licensing classes. That's how I got into amateur radio. Much of this disappeared in the angry days following IL. Most attempts to bring it back have failed. Part of that is the changing image of amateur radio, but part is due to the hiatus caused by the IL controversy.

>But I don't buy the argument that
>it was responsible for any significant loss of growth in the amateur
>ranks. Even less do I think it had anything to do with the demise of US
>equipment manufacturers. Keep in mind that at the same time US amateur
>manufacturers were dying out, so were major US *consumer* electronics
>manufacturers, and for much the same reasons: offshore competition
>(initially Japanese) provided lower-cost products that were more
>attuned to the wants and needs of the consumer. While it is true that
>this all occurred at about the same time that IL came into being,
>simultaneity doesn't imply causality. I've seen no compelling argument
>that IL and the loss of US amateur manufacturers are related. And I'd
>be curious to know how the Japanese manufacturers managed to flourish
>in a market that IL had supposedly destroyed.

Look back through QST archives and note when Japanese radios began to have a major impact on American hams. It was much later than 1968. The Japanese manufacturers moved in to fill an existing vacuum rather than actively displacing old line manufacturers. The reason the Japanese industry could flourish was that they had a bigger home market in Japan for their products than the entire American market represented. They still do, over 1,000,000 Japanese amateurs.

>Now, about the growth question. I'm sure that IL had *some* effect
>on growth, at least early on. But it's unclear how much. It *is*
>true that after IL came into being in 1967 (privileges actually changed
>in 1968 and 1969), growth was slow, it's also true that growth had
>slowed *before* IL. From FCC PRB figures, here are the number of
>licensed hams, 1965 to 1982:

>
>1965 260,301
>1966 255,952
>1967 256,998
>1968 256,546
>1969 264,601
>1970 263,918
>1971 264,374
>1972 262,093
>1973 253,357
>1974 256,264
>1975 260,091
>1976 290,251
>1977 328,648
>1978 356,336
>1979 373,779
>1980 393,353
>1981 398,829
>1982 410,304
>
>Note that the biggest increase in the 1965-1975 decade occurred during
>1969, just after IL took effect.

Remember that amateur licenses ran for 5 years during this period.
So you have to look at numbers five years down the road to get an idea
of the effect of incentive licensing. Look at 1973 when the numbers
dip below the 1968 count. Growth doesn't really pick up until the
FCC releases more *phone* spectrum to the general and advanced licensees.
By the 1980s a whole new generation is entering amateur radio who don't
know much about the debacle of the 60s. As far as they're concerned,
it's just the way things are done.

>In 1955 there were (esimated) 150,000 amateurs. Obviously there was
>massive growth between 1955-1965. What caused that growth to slow?
>I don't know. It would take a serious scientific study to find out.
>But it *did* slow, and *before* IL came into being. So to argue that
>IL was responsible is ludicrous. One other interesting item from the
>data is that there was a growth spurt in the late 70's (sometimes
>known as "the CB boom"). Since there were no significant changes to
>the IL structure during this period, it's hard to square the numbers
>with the theory that IL was responsible for "two decades of stagnation."

The late 1960s did see a substantial portion of the potential amateur
population visiting Southeast Asia. Another large contingent was in
the streets of America. This had an impact on amateur growth to be
sure. Unlike 1945 however, many of the returning radio trained servicemen
didn't become amateurs. I *believe* that this was because they saw
the IL structure as more of the mickey mouse BS they had been putting
up with in the military and they'd had enough of that. Most probably
became those "rebel" CBers of the mid-70s.

The entire phenominon would be a good subject for a thesis in misuse of government regulation.

Source record: 288550

This may sound like a dumb question, but what does the 30 meter band sound like? I never had any capabilities to listen there until this past weekend. I was playing with a homebrew receiver and found there was a awful lot of teletype and other "junk". I did not hear all that many HAM signals. I seem to remember that this band is shared with other services (is this still true?). So, I guess some of this other "junk" is to be expected. Is is? I also heard some Spanish SSB too. Do other countries have phone privileges on 30 meters -- or what this probably commercial stuff?

Valid point, but a brief look at most scanner laws in the few states
that have them shows that the laws are NOT under the motor vehicle
code. They are usually part of the criminal section AND they usually
carry criminal type violations and penalties (eg. misdeameanor, etc.)

NOT.
As a matter of fact, as I am writing this, I can see my system manager who
DID get busted for having a scanner on a traffic stop. He was arrested
and his radio was confiscated. Lawyers basically said he didn't have a case.

I very much doubt it. Molicells are Lithium cells, so they presumably put out on the order of 3 V apiece. (I guess the chemistry is different from Li primary cells, but even so the voltage should be somewhere in that vicinity.) NiCd cells produce 1.2 V or so -- which means a one for one replacement won't work at all.

The charging requirements may well be different too.

PS. Where did you find Molicells? I tried to get information from that company a while ago, and got back a letter that basically said "we haven't gotten things to work yet and we don't know when/if we will". That's the last I heard, so I assumed the product never did work out. I guess that was wrong -- or was it?

Jud,
I am currently running HamWindows and I am also a Beta tester for the program. I have been using it for about 5 months and CA Software who makes the product has been very receptive to any problems I have had with it. It is a great program for a Ham who likes to DX. It includes maps, and extensive information about a country in it's database, which is extensive. You will need a large disk drive to fully implement HamWindows with all the options. I believe HW takes about 6M without the optional features. With a RS 232 interface you can control your radio (including taking info from the radio for logging). I have it running on a 486/33 with Hambase, RigHelp, and their CIA Almanac. The "Demo Version" might only be achieved by someone giving you a copy without a password, I am not authorized to do this however. It will work for 7 invocations before it locks you out. You might be able to call them and ask them for a Demo Version. I had a lot of problems running it in Windows 3.0. Windows 3.1 runs much faster and smoother, I still have occasional crashes but nowhere near as many as in 3.0. If you want some more info on specifics, feel free to e-mail me or you can call me at 310-333-2355, if I'm not there I will call you back ASAP. CA Software plans on supporting this software and increasing it's functionality even more in the future. Also you might consider buying one of their video training tapes for $10 to check out all the stuff it does. CA Software phone is 714-675-4246, you should talk to Al Mayer or Bill Baker, tell them I referred you to them. 73

> this is about the same as NiCads.

Close -- about 55%.

While I was analyzing the battery life in a Uniden scanner for an
article a few years ago, I read up on Sanyo 600 mAH AA NiCd cells (see
Uniden/Bearcat 200XLT Scanner Review, RCMA Journal, Oct 1988).

Sanyo claims a self discharge rate of about 1% per day at 70 degrees F.
If you charge up a Sanyo AA battery but leave it sit in a drawer for
2 weeks, you've lost about 13% (nominal) of its charge.

Here's an abbreviated chart for the percent of charge remaining daily
in a Sanyo AA NiCd at 70 F. Note the calculation assumes there
is no external load on the battery.

day 1 99.00 day 51 59.90 day 101 36.24 day 151 21.92
day 2 98.01 day 52 59.30 day 102 35.87 day 152 21.70

>
> The term does not include a radio designed for use only in a dwelling.
>As added by Acts 1977, P.L.342, Sec.1
>---

The ANARC publication, "Listener's Lawbook" (1991) included the
following explanatory comments about the Indiana statute:
"This law prohibits the mere possession of portable scanners, and lists
exemptions. The statute defines portable scanners to be any radios,
capable of receiving police communications, which can be operated in a
vehicle (c)(1)....This law was construed by the court in "Wallman vs. State",
419 N.E.2d 1346 (1981). In that case the court found that the section
was sufficiently clear and definite to prohibit possession of portable
radios capable of receiving vocal police radio communications. However
the court found the statute to vague to prohibit the pssession of a
radar detector."

In addition to ANARC's comments, if you look at section c2, it also makes it illegal (in my opinion) to have a portable scanner anywhere but in your home or business. In other words, if you were walking down the street with a scanner, you are breaking the Indiana law.

Another poster mentioned getting a ham license. That's a good idea because it then exempts the ham from the law. There is now a codefree Technician class ham license that I don't think any scanner enthusiast would have difficulty in obtaining with a few weeks or months of studying the written test material. Of the few states that do have some type of scanner law, every one of them now includes an "exemption" for licensed ham radio operators.

Lastly, the original poster that started this discussion had talked about installing a scanner and having a hidden on/off switch to render the unit powerless if he was stopped. Before New Jersey changed its law, the NJ statute also used "capable of" as part of the statute's language. According to several attorneys and one local judge I talked to, that meant as long as the radio could be turned on and then tuned to a police frequency, the radio was in violation of the law.

Anyhow, that's my non-legal commentary on this discussion. None of this is offered as legal advice.

Standard Disclaimer- Any opinions, etc. are mine and NOT my employer's.

>many HAM signals. I seem to remember that this band is shared with other
>services (is this still true?).

I think it's now exclusively amateur (though that might not stop former users of the band). Lots of those TTY signals could very well be amateur, of course. During the right time of day you hear plenty of CW signals, too, though it isn't as crowded as (say) 20 meters. (As soon as I get around to working the chirp out of my homebrew transmitter, you'll hear my signal there, too :-).

>I also heard some Spanish SSB too. Do other
>countries have phone privileges on 30 meters -- or what this probably
>commercial stuff?

Commercial stuff should all be gone. Many countries permit phone where the US does not (Canada, as I recall, no longer has any restriction on modulation type other than maximum bandwidth). There are a lot of Spanish speaking pirates, but I'd suspect that they would be less likely to bother with 30 meters, for which there's probably a scarcity of equipment.

>
>Thanks in advance,

I think as of June 1 they had issued WZ3Y which would mean by now they are
all gone :-(I have not heard any AA3's yet, but I am sure they are out there.

I wonder who the lucky guy was that got WZ3Z ? :-)

That would mean that the FCC is no longer issuing "W" prefix HAM calls.
Think about it, in a few (?) years "W" may become a rare prefix :-)

The IL rules took effect on Nov 22, 1967. Anyone receiving a new
license in 1969 must have been tested under the incentive licensing
structure. (I know FCC licensing is slow, but not *that* slow!)

>the mass-market/beginner?

I have to take strong issue with this point. I got my ham license primarily to _experiment_ with digital communications. To me that experimentation revolves around making maximally efficient use of the bandwidth available to me, and I choose to do that by experimenting with software and protocols.

I'll grant there are fascinating (and potentially very useful) modulation techniques, modes, and hardware for digital comm out there, and there are people (like you, Gary, and others) who have the skills, background, and equipment to experiment with them.

I don't, and I resent your your commentary above, which to me reads as "RF engineering/design/construction is important. 'Mass-market' beginners don't have the skills or tools to do this important stuff, so we should ignore them."

Do you feel that the influx of "mass-market" no-code "beginners" is hurting the hobby? Fine. Teach the ignorant newcomers _why_ RF design and construction is important, and how it can be rewarding and useful.

>It is about the best of antenna that still makes it a handheld, I think.

I haven't used the Diamond antenna you speak of, but I just got an ANLI AL-800 antenna for my ICOM W2A. It's a 2-in-1 dual-band antenna with up to 3.2db gain on 2m, and 5.6db gain on 440 (presumably these figures are with respect to an isotropic radiator). There's a short bottom section with a gold BNC connector that connects to your HT, and there are two additional sections supplied, either of which you can screw onto the bottom section (hence the 2-in-1 designation). The first is a highly flexible rubber-duck (somewhat more flexible than the standard W2A rubber duck), and the second is a center-loaded telescoping whip. Each section is short enough to carry around in your pocket, so you can walk around with the rubber duck attached and switch to the telescoping whip (or vice versa) in just a few seconds. The entire antenna is 6" with the rubber duck attached, 7" with the whip attached and fully collapsed, and 31" with the whip fully extended (subtract about 2" to get the length of the top section without the base section). The performance of the rubber duck that came with my W2A, the AL-800 with the rubber duck section attached, and the AL-800 with the telescoping whip fully collapsed is roughly the same. With the whip fully extended, a formerly- S2 or S3 signal can easily peak the meter!

The antenna is very nice looking, being all black with gold highlights. I paid about $37 for it at HRO in Phoenix, AZ.

> Fairchild chip at one time. K9ALD

Oh, that one was priceless! It had a wonderful price vs. order-size
curve (carefully plotted on a log scale) with the derating factors for
30 day, 60 day, and "slow-pay" customers. Plus the note that the
recommended cooling was a 6' fan at 6", but that for improved
performance you could increase that :*). Also, V-sub-SD was 117vac on
pin 7. That's V-sub-Self-Destruct, important when building to
mil-spec.

This would be around January of 1974, I belive. We had a heck of a
good laugh over that one.

regards,
Ross VE6PDQ

3543. Dual Antennas in proximity - any advice?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-16 17:45:10 UTC
From: mjr@netcom.com
Message-ID: <+6hl9+n.mjr@netcom.com>
Source record: 288567

Well I'm going to get my ticket any week now (6+ and counting since my CSCE). I'm looking into putting up a VHF/UHF base antenna, probably a dual band favoring VHF as it seems I have many more VHF repeater options in my location then UHF. My base station (an Alinco 580T HT) will normally operate at 5 watts, with possible boost to 35 or 50 watts when/if necessary.

I also have a scanner, and while I'm on the roof of the house, I'd like to put a separate antenna up for it. Given my location, the scanner antenna (receive only) is going to have to be close to the VHF/UHF xmit/receive antenna. I can vary their separation from a couple of inches to maybe 1 meter, but not much more than that. My question is:

Should the scanner antenna be as close as possible to the xmit/receive antenna (a fraction of both xmit wavelengths), or should it be as far as possible from it (about 0.5 lamda for VHF and 1.25 lamda for UHF)? Alternatively, should I give up even trying to mount the scanner antenna anywhere near the VHF/UHF antenna?

Also, I usually operate the scanner from roughly 40Mhz to 460Mhz. Is there a good antenna that covers this wide range for receive purposes only? Right now the scanner is plugged into a 15 meter-long horizontal wire that I use also for world band listening. It works, but I thought if I'm on the roof, I might try to get something better up there for it...

All informed opinion welcome by email or here...

Thank you...

From: GIDEN@WSUVM1.CSC.WSU.EDU
Message-ID: <9206161827.AA04851@ucsd.edu>
Source record: 288566

Carl Estey (Skyler.mavd.honeywell.com) suggested posting the results of my query for FT-470 mods.

Several responses were received - two files, each about 600 lines - are the most comprehensive.

1. Brian McMinn (brian@nucleus.amd.com) N5PSS list sent by Mike Abelson <abelsm@rpi.edu> Jun 8, 1992

Yaesu FT-470 MODS Rev C (Apr 6, 1992)

2. John Schubert - KC6OVN (didn't save email id, but I've seen his name on INFOHAMS before).

Since the lists are so long I'm not posting them here, but will send anyone a copy of the lists I have if they email a request to me.

Either of the respondents above might point out where these lists might be available on an updated basis. Thanks to Brian, Mike and John and the others who resonded.

W 2x2 calls (e.g. WA1AA) are scheduled to be distributed when the K 2x2 calls run out. 4-land is well along in giving out K 2x2's, so we might see some in a few years. And W 2x3's (those that haven't already been issued) will take over after K 2x3's run out. But don't hold your breath for that!

>anyone has a good reason to want it, please E-Mail to me.

>Van - W8UOF

Well either there are 2 identical kids that have just had
the same exact experience or he is talking about my son
(KD4HQV/AG).

Well Van... that was a really big boost for my day reading
the info-ham and just happening to come across your
message.. It may have even made my whole week...didn't have
your direct E-Mail..

Well first of all Danny (KD4HQV/AG) probably isn't a genius.
He really hasn't learned to type ... just hunts and pecks..
but he really has good study habits and studied real hard
for the written every day after school. He has also passed
his 20 wpm CW. The CW came much easier to him. He sends
really well and has good word and character spacing.

He is now taking a break before he tries the Advanced. He has 4
other 8-9 year olds at the schack right now introducing them
to Ham Radio.

I am hoping to work with the University club and the local
elementary school to work Amateur Radio into the Science
curriculum (one of the 4th grade teachers has a General
license).

So Van .. hope you read this...and thanks

73s de Cookeville, TN
Jeff, AC4HF and
Danny, KD4HQV/AG

A full review of the Kenwood TH27a ran in the March Issue 1991 of CQ

Keyboard Mods to access AM detector and change band:

Press the ENT key once or twice to place HT in VFO mode and in the 2m band
Depress the F key for 2 secs. (Note flashing F in lower right corner)
Release F key and press MHz key
HT will shift to 118.00 MHz and activate the am detector
Store any freqs from 118-138 into memory
Hit F key till it flashes
Hit MHz key
Your back on 139-170MHz with FM detector

This is a very sophisticated HT and now a great bargin

-- MONTHLY REVIEW OF SOLAR TERRESTRIAL ACTIVITY --

Summary for May 1992 and Six-Month
Solar Cycle Outlook

Data Provided Courtesy of the
Space Environment Services Center, NOAA
and the
NRC / Dominion Radio Astrophysical Observatory
Penticton, British Columbia, Canada

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK JUNE 1992 - DECEMBER 1992

We are now in month 69 of solar cycle 22. Activity levels were low again, with a total of only five energetic events this month compared to eight last month. Like the previous two months, only one of these energetic events reached major flare calssification. Sunspot number and 10.7 cm solar flux continued to fall as they have since February.

The first two events were attributed to Region 7150 (S07,L=269), the first was an M1/1N Tenflare (140 sfu) at 03/0858 UT followed by an M1/SF at 04/1136 UT. Region 7154 (S25,L=152) produced the remaining three events, beginning with a long duration M1/1N tenflare (400 sfu) at 04/2257 UT. The second flare from Region 7154 was also an M1/1N, this one at 05/2015 UT. Activity was then low until 08 May when Region 7154 erupted with an impressive M7/4B tenflare at 1546 UT. Strong radio emissions were observed across the spectrum, including a 3100 sfu tenflare and a Type IV sweep. An interesting C3/2F Hyder flare at 07/0649 UT from S23E48 was the precursor to a large eruptive prominence at S21E90. The EPL had material visible to .58 solar radii and was associated with strong Type II and IV radio sweeps. The shock velocity from this EPL was estimated as high as 2000 km/sec.

There was one proton event this month and one small proton enhancement. The event began at 09/1005 UT in response to the M7/4B flare. Flux levels continued to slowly rise until 1955 UT, when a dramatic rise in flux levels coincided with a sudden storm commencement. The proton event finally reached a maximum of 4600 pfu at 09/2100 UT (at greater than 10 MeV), making this the largest proton event since March 1991. There were very few higher energy particles associated with this event and the event ended at 11/0615 UT. A polar cap absorption event began at 09/1405 UT, reached an estimated maximum of 20.4 dB at 09/2100 UT and ended at 11/0000 UT. There was a slight enhancement of the greater than 10 MeV protons beginning at 24/0430 UT. Proton levels never surpassed event levels and a source was never determined.

Geomagnetic activity was mostly quiet to active. Two days of storming at mid-latitudes, 10 and 11 May, were attributed to the EPL/Hyder flare of the 7th and the M7/4B of the 8th. A sudden storm commencement of 31 nanotesla was observed at Boulder at 09/1955 UT. Severe storming was reported at many mid-latitude stations from 10/0900 UT until 11/0000 UT.

Activity levels are still expected to plateau at this new lower level before continuing their drop toward solar minimum.

The lowest smoothed sunspot number for Cycle 21, RI = 12.3, occurred in
September 1986. The sunspot maximum for this cycle (cycle 22) occurred in
July 1989, with a peak smoothed sunspot number (RI) of 158.1.

Note: Prior to June 1991, the 10.7 cm solar radio flux measurements
originated from the Algonquin Radio Observatory near Ottawa. From June 1991
onward, the flux has been (and will continue to be) measured from the
Dominion Radio Astrophysical Observatory at Penticton, British Columbia,
Canada.

3553. Improving CW Speed

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-16 21:06:47 UTC
From: brucec@tekgen.bv.tek.com
Message-ID: <859@tekgen.bv.tek.com>
Source record: 288574

I want to get better at CW. In particular, I would
like to be able to send and receive on the air at
25+ wpm. Although I can copy "structured" messages
(like FCC exams) at 20 wpm, practically speaking I am
really operational at only 15 wpm. Does anyone have
a recommendation for a path to get from 15 to 25+?

Here is what I am doing now:

Recording W1AW code practice and listening to it on the
way to work everyday. I try to have a sit-down, hard copy
session every other day.

A QSO/day. I try to squeeze in at least 1 QSO a day on
20 meters.

Learning to 'type/copy'. I have troubling writing at 20 wpm such
that afterwards I can read it! I figure if I am going to break this
barrier, I will have to learn how to type while listening to cw.

Any suggestions for what worked for you would be appreciated. I see
those ads in QST for code-improvement, but they remind me of the
Charles Atlas ads I used to see in comic books. $20 miracle plan to
learn cw while you sleep!! Yeah, right.....

advTNXance

3554. Re: Help to identify callsigns

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-16 21:26:22 UTC
From: rusty@anasaz
Message-ID: <1992Jun16.212622.25820@anasaz>
Source record: 288476

In article <1992Jun9.235405.18889@m2xenix.psg.com> eduardo@m2xenix.psg.com (Eduardo Salom) writes:
>Somobody knows any of the following callsigns?
>I have tried the callsign database but for all of them I got
>'No references found'

>wh6ii
>ka4ybf
>n7wbo

I'll guess that the U.S folks either got their callsigns after the most recent previous callsign project run (more on the current round in a moment), OR they are bogus. REmember that the callsign database is, at best, out of date about a week after it gets posted :-)

On the subject of the CURRENT callsign project, I called NTIS last week, the person I talked to got sick for a week and finally called me back today. They (NTIS) got a tape from the FCC today and were making my tape, will go out tomorrow via UPS (i.e. wait another week before it gets here). I'm hoping that this means that we will be getting data current as of the end of LAST month (May) rather than the BEGINNING of May as I requested.... But, this being the Gov'ment.... I'll let everyone know when I've parsed the database for the most recent update date.

Unfortunately, Fred has left for vacation and will not be back for a little bit (3 weeks? email him, I'm sure he has an autoreply set up), and he is a bit concerned since nobody has actually sent tapes to him (he's the one getting stuck if not enough folks join in this time). He dropped the price $5 in hopes to attract more folks, I hope he does not eat this one :-) and :-(

If folks want to send the tapes to my P.O. box I'll be happy to forward them on to Fred when he gets back. (I told him he should cancel his overseas vacation so he could be here when the tape showed up, but NO, not him :-)

Anyway, I'll post when the tape actually shows up and I know the last entry in the file.

3555. SSTV on SAREX

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-16 21:40:54 UTC
From: kohlwey@nu.sim.es.com
Message-ID: <1992Jun16.214054.6733@javelin.sim.es.com>
Source record: 288575

How does the SAREX missions use SSTV?

Is it downlink only?, Is it sent on 145.550 FM?

Is it used for school contacts only on unanounced
freqs?

Might as well see how wide we can spread the thread! Here in
Washington, the newest rage is the police mobile data terminals
(MDT's) in the police cars. Simply put, coulnd't these be
construed as "distractions" much like a TV. How many police
officers do we know that can drive, type AND talk on the radio
at the same time?

Are they being hypocrites? Place opinions here: _____________

>25+ wpm. Although I can copy "structured" messages
>(like FCC exams) at 20 wpm, practically speaking I am
>really operational at only 15 wpm. Does anyone have
>a recommendation for a path to get from 15 to 25+?

Try to copy code much faster than you can comfortably
receive. Listen to W1AW on the high-speed days, and
copy the 35 and 30 WPM segments. Or get a good CW
program for your PC and set it to those speeds. I
really like the one by GGTE - it generates really random
QSOs, not hightly predictable ones like many pgms. Don't
worry about 100% copy (or even 50%).

I have no solution for the handwriting speed limit - that's
a problem for me too. On the air, you can copy in your head,
and only write notes, but that doesn't work for copying
bulletins. You could try copying on a PC - I can type a
whole lot faster than I can write longhand.

3560. Yaesu FT-470 replacement rumor?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-17 00:40:06 UTC
From: wmb@ulysses.att.com
Message-ID: <16848@ulysses.att.com>
Source record: 288483

I understand that Yaesu is planning to bring out a new dual-band (2m/70cm) handheld, to replace the FT-470, in the near future.

Does anyone know anything about it? When due? Features? Size? Comparison to the FT-470? Relative price? Do they already sell it in Japan or elsewhere? Is it worth waiting for? Is there really such a rumor, or did I just start one..?

3561. DX anyone?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-17 00:41:12 UTC
From: steve@carlyle.CArlyle.COM
Message-ID: <41418.steve@192.9.1.30>
Source record: 288482

I'm curious about the fact that there's not much discussion of DX on this list; is there a separate list for DXers? If not, should there be?

Anyway, the reason I ask is that I'm in need of some advice. I'm planning another personal DXpedition of sorts on my boat (the last one was to Palmyra, Penrhyn (North Cooks) and 3 islands in FO land). This one will be around the world, stopping at rare, semi-rare and not-so-rare places along the way to operate DEPENDING, of course, on accessibility and permissions. I'd like to hear from anyone who has advice or tips to offer on getting a license and permission to operate from any of the QTHs listed below.

I should add that I already have all of the information available in ARRL's files, and the book on operating in the Carribean.

Proposed itinerary (partial; obvious ones like Mexico, Australia, etc. are omitted):

CALL QTH

XF4 Revillagigedo
FO/X Clipperton
A35 Tonga
FW Wallis
3D2 Conway Reef
ZL8 Kermadec
VK9 Lord Howe
VK9 Willis
YF Vanuatu
FK New Caledonia
H44 Solomons
P2 Papua/New Guinea
9V Singapore
9M2 Malaysia
VU4 Andaman/Nicobar
4S Sri Lanka
8Q Maldives
VU7 Laccadives
7Q Yemen
ST Sudan
5B Cyprus
ZC4 UK Sovereign Bases
SV5 Dodecanese
IS0 Sardinia
3V Tunisia
TK Corsica
EA6 Balearics

CT3 Madeira
EA8 Canaries
D44 Cape Verdes
YV/0 Aves Is.
KP1 Navassa
HK0 Malpelo
HC8 Galapagos

I realize that some of these may be impossible (although perhaps not by the time I get there!), but if so, I'd like to know that, too.

And no, sorry, at the moment I don't plan to go around Africa, which leaves out the Seychelles and other islands off the east coast of Africa.

Thanks for any advice you can give me!

3562. Ten-Tec OMNI VI (very long)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-17 01:42:04 UTC
From: MOSIER@sdchemi.ucsd.EDU
Message-ID: <01GLBHTHMT1E94DQMB@IRIS>
Source record: 288508

I do hate to post things this long, so I'll apologize in advance. Just hit your return key half a dozen times if you don't want to see it. Several people have asked for it. Most of this is descriptive, but I was unable to figure out from pictures and ads just what various functions the OMNI VI had until I actually got my hands on it. So I thought this would be helpful to those who are seriously interested in the rig.

==========cut here==========

TEN-TEC OMNI VI

SUMMARY OF SPECIFICATIONS (from Ten-Tec)
==========
GENERAL: USB, LSB, CW, FSK or AFSK, FM built-in. All ham bands 160 through 10 meters, (12) 500 kHz segments with 30 kHz overshoot at upper and lower band edges. Seven-digit main display to 10 Hz resolution, with 2 secondary displays for clock, memory channel and offset. LO generated with a crystal oscillator mixed with a low noise 4.97-5.53 MHz phase locked loop. Offset tuning, +/-9.99 kHz, receive and transmit. Dual VFOs with SPLIT mode. 100 duplex memories with battery backup and 1 scratch pad memory. Serial port operation of receive and transmit, with both two line and RS-232 interface running at 1200, 2400, 4800, 9600, or 19200 baud. Frequency accuracy +/-50 Hz @ 25 deg C. Requires 2 A receive, 20 A transmit @ 12-14 VDC. Construction: 20 G10 epoxy glass PC boards, most field replaceable. Extruded aluminum front panel, aluminum chassis, texture painted top & bottom, snap up stainless steel bail. Dimensions: HWD 5.75"x14.75"x17". Weight 16 lbs.

TRANSMITTER: 0-100 watts output, ALC stabilized. 100% duty cycle for up to 20 minutes. Continuous duty with customer supplied air cooling of rear panel heat sink. Mike input 200-50K ohms, accepts microphones with 5mV (-62dB) output. Polarizing voltage for electrets provided. Speech processor with adjustable compression level. PTT or VOX on SSB, switchable FAST or SLOW QSK on CW, delay on SLOW is adjustable. Built-in iambic keyer, adjustable 10-50 WPM, type A or B, weight adjustable from keypad. CW offset programmable 400-990 Hz, DSP generated, sidetone automatically matches offset, volume adjustable independent of AF gain control. FSK shift 170 Hz. FM deviation +/-5 kHz. SSB generation by balanced modulator followed by 9 MHz, 8 pole crystal ladder filter. Carrier suppression 60 dB typical. Unwanted sideband suppression 60 dB typical at 1.5 kHz tone. 3rd order intermod 30 dB below two tone at 100 watts PEP. Spurious output better than 45 dB below peak power output.

RECEIVER: SSB,CW,FSK sensitivity: .15uV for 10dB s/n @ 2.4 kHz.
FM sensitivity: .30uV for 12dB SINAD @ 15 kHz. Selectivity:
2.4kHz@-6dB; 4.5kHz@-60dB; 1.87:1 shape factor
1.8kHz@-6dB; 3.4kHz@-60dB; 1.89:1 shape factor
0.5kHz@-6dB; 1.4kHz@-60dB; 2.80:1 shape factor
.25kHz@-6dB; .85kHz@-60dB; 3.40:1 shape factor
15 kHz@-6dB; 30 kHz@-60dB; 2.00:1 shpae factor (FM).
Dynamic range 97 dB @ 2.4 kHz bandwidth at 20 kHz spacing, 100 dB+ with CW filters. 3rd order intercept +10 dBm. Noise floor -133 dBm @ 2.4 kHz bandwidth. Phase noise -122 dBc @ 1 kHz, -138 dBc @ 20 kHz. S-meter calibrated to 50uV at S9. Passband tuning +/- 1.2 kHz. 9 MHz first IF, 6.3 MHz 2nd IF (455 kHz 2nd IF on FM). Adjustable threshold noise blanker. Automatic DSP notch filter eliminates multiple heterodynes, notch depth automatically selected for each. Manual notch filter 250 Hz to 2.2 kHz, greater than 50 dB. CW DSP lowpass audio filter selectable in 5 steps: 1400, 1200, 1000, 800, 600 Hz, or disengaged. Receive recover time less than 20ms including split mode. Squelch sensitivity less than .6uV. Image rejection >90dB. I-F rejection >90dB. Audio output 1.5 watts @ 4 ohms with less than 2% distortion. Built-in spkr, separate fixed output 1mw@600 ohms. Separate receive antenna input at 50 ohm phono jack, front panel selectable.

REAR PANEL CONNECTIONS
======================
EXTERNAL SPEAKER - 1/4" phone jack
INTERFACE PORT - 25-pin D connector
MARK/SPACE - phono jack
AUDIO IN - phone jack, in parallel with front panel MIC connector
AUDIO OUT - phono jack, 1 mw @ 600 ohms fixed level
SERIAL PORT - 1/8" phone jack, requires serial level converter
POWER - Molex(?) style connector
GND - threaded stud
TX OUT/TX EN - (2) phono jacks for amplifier control lines, with jumper
MUTE - phono jack, manual T/R control to override QSK on CW
PTT - phono jack, manual T/R control on other than CW
KEY - phon jack, for straight key or external keyer
KEYER - 1/8" stereo phone jack, for paddle
AUX - phono jack, +13.5 Vdc, 2 amp max
RELAY [N.O.] - phono jack, control of non-QSK amplifier
AUX RX ANTENNA - phone jack
50 OHM ANTENNA - SO-239, transmit/main receive antenna

FRONT PANEL CONTROLS & FUNCTIONS
================================
Refer to the picture in the QST ad to see where these controls are located.

Left Side of Radio:
===================
KEYER SPEED (knob)
PROCESSOR (knob) - sets compression level
METER (knob switch) - FWD, SWR, IC (collector current), and PROC
POWER (switch)
ANT (button) - main/aux receive antenna
AGC (button) - on/off
AGC (button) - fast/slow
NOTCH (button) - manual/auto - selects auto notch (voice mode only - removes
any and all heterodynes digitally) or manual notch only (knob below).
Both auto and manual notches can be used simultaneously.
QSK (button) - fast/slow
ATTN (button) - -20dB
N.B./SQUELCH (concentric knobs) - squelch (FM only) and noise blanker level
PBT/NOTCH (concentric knobs) - pass band tuning and manual notch
RIT/XIT (knob) - sets the RIT/XIT offset, as well as the offset/sidetone
frequency when in the ST set mode
PROC (button) - speech processor on/off
MIC/PWR (concentric knobs) - mike gain and RF power output level
AF/RF GAIN (concentric knobs)

Right Side of Radio: (all buttons) (*=speaks to you in CW if selected)
====================
TUNE - switches transmitter ON, in the CW mode, key down. Press on,

press off.
*CW - selects CW mode. All IF filters are usable. The CW DSP filter is
also activated if it has been programmed in the USER OPTIONS menu.
The CW button becomes the SPOT button after CW is selected, turning
on the sidetone for matching the received signal frequency to the
transmit frequency.
*USB - selects upper sideband mode. All IF filters are selectable.
*LSB - selects lower sideband mode. All IF filters are selectable.
*FSK - selects digital modes, with FSK circuitry controlled through the rear
panel MARK/SPACE connector. During receive, the FSK mode receives
LSB and all of the IF filters are selectable.
*FM - selects FM mode. The IF filter defaults to the 15 kHz filter which is
part of the built-in FM circuit. The narrow IF filters and PBT are
not active. In FM mode, MIC gain is converted to a FM deviation
control.
2.4 \
1.8 \ 6.3 MHz IF filters
500 / only the 2.4 is standard
250 /
NAR - select one optional 9 MHz IF filter
*RIT
*XIT
REV - push to listen on your transmit frequency when operating SPLIT
*A=B
*A/B
*SPLIT
LOCK - locks frequency control. Press and hold for one second, and USER
options menu comes up. UP/DOWN buttons make status selections and
ENTER button cycles through menu. Press LOCK again to exit.
*RIT and XIT - each on/off, may be used simultaneously. When both
functions are activated, you are operating simplex at the offset
displayed.
NUMERIC KEYPAD - provides either band switch or direct frequency entry.
UP/DOWN arrow keys change 100 kHz digit, and also set other
functions.
ENTER - reverses numeric keypad mode (frequency <-> band entry).
CLEAR - lets you abort key operations
VOX - turns VOX on and off with main display annunciator
GN - vox gain. When pressed, clock display changes to 2-digit
display between 01-15. Use UP/DOWN buttons to make vox gain
adjustment and press ENTER to save.
DLY - vox delay, same display/set as GN
AV - anti-vox, same display/set as GN
CLK - clock set. Press and hold for 1 second. Use UP/DOWN and ENTER to set.
ST - side tone. When pressed, use UP/DOWN to set level between 00-31 on
upper right hand display. Set frequency (both offset and sidetone)
with RIT/XIT knob, listening to tone and reading tone frequency
(400-990 Hz) on lower right hand display. Press ST again to store
values. Press ST, then press CW: lower right hand display now shows
relative indication of 1.00, equivalent to 3:1 dot/dash ratio on keyer.

Use UP/DOWN to adjust weighting from .6 to 1.4 on the display. Upper
right hand display shows keyer speed. Save weight setting by pressing
ENTER.
DIM - when pressed, select display brightness level between 0-15
on display. Press again to save.
VOICE - announces frequency if Voice Readout Board is installed.
*VFO->M - press and the display prompts for a two digit address number, which
you enter from the keypad. Hold in for one second and the current
data are stored to the scratchpad.
*M->VFO - press and the display prompts for the two digit address. Hold in for
one second and the scratch pad memory is recalled.
*MS - press and use the main tuning knob to scroll through the memories, with
the memory address and frequency displayed. Receiver stays on frequency
in use. Press again to cancel. Press M->VFO to transfer memory to
active. Press and hold MS for one second, and the receiver scans
between the display frequency and the band register frequency for that
band.
*MT - press and use the main tuning knob to tune through the memories, with
the memory address and frequency display, and the receiver active on
each channel as it is displayed. Press again to cancel. Press M->VFO
to transfer memory to active. Press and hold MT for one second, and
the receiver will scan through memory channels automatically, with the
scan rate set by the UP/DOWN buttons.

Main Tuning Knob has very good feel, but is VERY SLIGHTLY eccentric on shaft.
Has finger spinner indent.

MEMORY SYSTEM:
==========
There is one scratch pad memory, a band register memory for each band, and
100 general purpose addressable memories. Each of these 100 will store mode,
filter selection, split info, RIT, and XIT. The band register does not store
split.

GENERAL COMMENTS AFTER ONE WEEK OF USE
====================================

Radio is generally very easy to use. I bought the radio with Ten-Tec's power
supply, all of the 6.3 MHz optional IF filters (1.8, 500, 250 Hz), a 500 Hz
filter for the 9 MHz IF, and the remote tuning dial, which sits on your desk
and connects to the RS-232 port in the rear via a coiled cable. It operates
in parallel with the main tuning dial. Only other accessories available:
ALC beep annunciator, voice frequency readout, 500 Hz filter set for RTTY,
1.8 and 250 filters for 9 MHz IF (only one can be installed). Some things
I like VERY much. There are no rear panel or top panel controls. Everything
is up front. FM is standard, which it wasn't on the OMNI V. The adjustable
offset with tracking sidetone is very nice. Spotting with the CW mode button
is also very easy. No problem getting on frequency quickly on CW. The auto
digital notch is VERY effective on SSB (it doesn't work on CW, unless you
just want to change all the dahs to dits, in which case it works fine).
Interference from lids tuning up on top of a pileup simply doesn't exist

anymore. The manual audio notch is particularly easy to use. The VOX is very impressive (I've had some lousy VOX - most of you probably won't be as impressed). The anti-vox is very good. I have it set fairly low (1/3 up) and yet speaker audio never trips it. I'm using an old D104 mike with base preamp, which I'm powering off of the 4 volts available at the mike connector. I've had several reports saying the audio is about the best ever heard. Then they say it sounds better with the processor on. One station across town said it sounded more like the telephone than SSB. Stability is excellent, with all oscillators slaved to a master oven. The noisy linear relay that you had to clip a wire to turn off in the OMNI V now turns on and off from the USER OPTIONS menu.

When QST reviewed the OMNI V, they thought it was a super basic radio but listed a number of things they wished it had for contesting/DXing, saying that those extras would make it THE radio of choice. The OMNI VI seems to have addressed all of that wish list, including bandstacking registers, addressable memories, RIT/XIT, dial lock, adjustable offset/tracking sidetone, and all front-panel controls (I'm working from volatile memory in recalling that list).

At first, I set the power supply (which has an external speaker) next to the radio. I could hear some hum in the external speaker with the AF gain all the way down, but not noticeable in headphones. Then I set my transmatch in between the power supply and radio and the hum is now gone. I do get some thumping/clicking from the power supply speaker on QSK, but not with headphones. But coupling between the power supply and speaker is probably to be expected, and I may put an external speaker elsewhere. I'm also thinking about pulling the power supply from its cabinet and mounting it elsewhere, leaving only the speaker there. That would then give me some cabinet space for other station accessories.

I got a report the other day of a slight click on CW. I called Ten-Tec and arranged a CW sked with Paul, one of their engineers. He said the waveform did sound a little sharp, and that I should take the bottom cover off and make sure the "CW WAVEFORM" pot was set full CCW. I did and it wasn't, so I did. But I still got a report of a "sharp waveform." Paul said he had gone back and listened to it at some length. He said they did purposely make it a bit sharp to cut through on DX, but said they were now going back and discussing it some more. So now I'm just going to wait and gauge the reaction of users, QSOs, and Ten-Tec to the waveform.

I have found one software glitch so far. The A,B annunciator lights on the main display for the dual VFOs don't switch correctly on VOX when operating split, even though the split frequencies are right. They work fine on PTT. Ten-Tec looked into it and confirmed the problem. Paul said that there would probably be some other software updates as they got feedback from the first radios out and said they would send me new chips before long.

One of the features of a crystal-mixed oscillator rig is that there are a fair number of fire-breathing birdies. OMNI V users had to learn to live with that. Ten-Tec told me they made a special effort on those and reduced them by about half. I never had an OMNI V but I can say that there are birdies in the VI.

Ten-Tec sent a very abbreviated manual to get the rig on the air. The
detailed manual with schematics is still a few weeks away from being finished.

> learn cw while you sleep!! Yeah, right.....

Bruce, the stuff you're doing is just fine (QSO a day, W1AW schedules, etc.) But just a suggestion -- for *part* of your practice, put down the pencil, keyboard, etc. and just copy as much as you can in your head.

I learned code the Navy way -- with a keyboard. They ingrained a pretty reliable ear-->keyboard link at 25wpm and up. Only trouble was, I didn't have to pay attention to the *content* so I never learned to.

When I got a ham ticket, I found QSOs difficult . . . basically, I'd have to type what was coming across, then read it. A bit of a bother. Finally got in the habit of leaving the radio tuned to the low end of 20M all the time when I was puttering around the shack. Without trying, I eventually got to where I could copy pretty well in my head.

So that's my recommendation: take the pressure off yourself, and just listen a lot, and accept whatever you can make out. In time, your speed *will* increase.

Best regards, from the ever-lazy ex-Navy code instructor,

Warwick Latham, ZK1WL, is indeed a resident, the only ham on Penrhyn,
operator of the radar and weather stations there, and on top of that he's
a great guy. When I was there, he kindly let me use his shack to guest-
op. Unfortunately for DXers, Warwick is more interested in satellites
and experimenting than in being an "appliance operator" for the Deserving.

I guess I haven't made myself clear. I'm not asking for box score results of "content" to appear in a VHF+ column, though there's nothing wrong with that either. FM/RPT and Section News cover public service communications adequately now, and rag chewers don't care about columns. What I want is a *technical* column that talks about ways to *exploit* radio technique to enhance content.

This appears to be a more difficult concept to explain than I thought. Let me go back to the example I used earlier that a picture is worth a thousand words. When communicating a circuit design to another person over radio, FAX would enhance that particular communications. That's the type of thing I mean by exploiting radio technique to enhance content. We often get bogged down with issues of maximizing distance and bits per baud when what we really want to do is convey an *idea* from one person to another. What I'm asking for is a column aimed specifically at techniques for facilitating idea exchange. This is akin to the fad in the computer world for multimedia. Though pictures aren't always the best way to communicate an idea, they will serve for this example.

>BTW, I don't see much high-tech about amateur VHF-FM. Repeaters, and linked
>repeaters, must be at least a generation old. What else is new ... ? Now I

There is considerable new work with digital methods of enhancing repeater functionality. While there's little new on the RF front, digital speech processing and storage have allowed many new features. A local company, A/D Technologies has a marvel of computer engineering available as a repeater controller. Aside from real time speech processing and voice mail and engineering data like SNR reporting and deviation reporting and TT testing, the controller also offers the possiblility of digital routing and linking of machines for realtime and voice mail delivery. This is new. Linked systems can allow a user to pick up voice mail left for him on any compatible machine from any other compatible machine linked to the system. Voice mail files

are linked and routed via high speed digital links. No longer do you have to have a *superstation* that can access all systems. If you can reach *one* you automatically have access to all.

>WILL admit that ham packet radio is demonstrating practical solutions to many

>Only a few, for example W6GN, seem to be pushing the RF front - but they
>never appear in QST. Is this because of a policy of addressing the mag to
>the mass-market/beginner?

Well the GRAPES high speed modem project that I'm involved with is an example of enhancing throughput. We've been pushing this RF modem since 1989. So far most of our sales have been outside the US. The cynic in me says that's because most US hams are caught up in DX fever, but the real reasons are likely that there's no regular forum for keeping the idea before the public. Phil Karn wrote a feature article reviewing the modem for 73 Magazine, and we've been mentioned in a couple of packet newsletters, but packet columns, such as they are, seem to be mired in telling people how to connect Bell 202 TNCs to handy talkies. That technology is obsolete. The throughput is so awful that real *content* of communications is sharply limited.

>I REALLY pity the younger ham. Nearly every place they can (afford to) live
>essentially forbids HF, weak-signal VHF/UHF, and microwave work, by means of

>draconian antenna restrictions. I would guess that ALL newer housing
>developments within 40 km (25 miles) of me forbid antennas. Should the
>League undertake/encourage a project to encourage the development of good
>residential "stealth" antennas?

Antenna restrictions are a serious problem, though they affect mainly the traditional DXer, HF and VHF+. While we should fight such restrictions as much as possible, we should also look at them as an opportunity. Techniques such as AMTOR and now Clover II allow us to communicate with much less elaborate antennas and lower power levels than more traditional methods. The combination of DSP, FEC, and digital signalling offer the possibility of utilizing very weak signals for communications without the need for large antenna arrays.

In addition, networks of stations linked to gateways are now practical. The community satellite access gateway concept should be exploited by clubs. We have the technology to allow HT access to our amateur satellites. What we don't have is the organization to do so. We have the technology to exploit cellular network concepts for voice and data, but lack the organization to realize them. With computer aid, even traditional HF DXing could be done through gateway stations, though how you'd keep "score" is an issue. If we weren't so concerned with competition and

scorekeeping, access to the HF bands could be as simple as access to a local VHF repeater.

Now I know that these ideas are foreign to most traditional amateurs. That's why a new column is needed, to make these ideas, and others, normal and commonplace by their familiarity. The bulk of the editorial material in QST is occupied by gamesters and their scores. That's a dying idea in this day of antenna restrictions and modern electronics. It's time we started looking toward the future instead of the past.

Let me share my experience with TV receiving antennas. For UHF, theory says that a dish is best, followed by the corner reflector and the multi-bay colinear arrays. However, my practical experience in the field with commercial antennas shows that the cheap four bay bowtie outperforms the others in many cases. Especially when coupled with a antenna mounted preamp. This is likely because commercial dishes and corner reflectors are poorly constructed. To cover the entire UHF band from channel 14 to channel 69, a yagi design is totally unsuitable. Attempts at log periodic arrays are available, but generally are too compromised to be useful.

If you only want to receive one channel, the yagi is an excellent choice with lower wind loading than the arrays, but if you need to span the band, you want a broadband array.

For VHF, dishes and corner reflectors become impractically large. The best compromise for spanning the band is the log periodic array. For weak signals, however, yagis cut to the specific channel are best. If there are many VHF signals that you want to pick up, the collection of yagis can create a windloading problem, not to mention a problem with neighbors who don't appreciate the beauty of aluminum trees. :-)

Location is usually more important than absolute gain. The old rule of the higher the better applies, but there are instances where a lower antenna mounting position performs better. This is because of adverse reflections in the area or because of ground reflection gain enhancement. Often it is necessary to experiment to find the ideal antenna location.

The 30m band is only used for CW, RTTY and packet. You can usualy hear CW at
the bottom of the band and packet on 10.145 and 10.147.

I can hear a strong teletype signal on 10.128 Mhz almost continuously from my
QTH here in Illinois. It sounds like RTTY, but I can't decode it. It may be
very fast CW. Does anyone know what this is ?

At the present time, the vast majority of amateur packet communication uses
FM-FM modulation, surely about the least-bandwidth-efficient choice available.
Can you improve the current bandwidth and required-signal-strength efficiency
by a LARGE factor with improved protocols and software? However, there IS
certainly room for more work on protocols, etc. Develop a really-efficient
multipoint meteor-burst communication protocol, for example. Oh, and yes, I
do understand that trade-off between doing an operation in hardware or
software is an implementation detail (ie: DSP vs. hardware filters), but you
should know both fields to make the better choice.

**** stuff left out ****
>****** I resent your your commentary above, which to me reads as
>"RF engineering/design/construction is important. 'Mass-market'
>beginners don't have the skills or tools to do this important stuff,
>so we should ignore them."

No activity can survive without beginners. The no-code license was sold
partially on the basis that it would bring in loads of technically-advanced
people. I would hope that even the less-technical beginner would want to
learn about how radio/radios work. The mags seem to have dumbed-down for fear
of frightening the beginner with technical mumbo-jumbo. They send the
not-trivial tech stuff to Siberias like QEX. Have you ever seen a copy of QEX?
Not much tech content there, either. Ham mags shouldn't be at the research-
topic level, but the recent emphasis on "connect-these-together", "cw-from-
my-bicycle", "construct-this-....", almost always leaves out any discussion of
the theory of operation or the design choices. This applies to the software
and protocol articles as well. How often do you see commented code
or pseudocode in a ham mag? "Takes too much space."

>Do you feel that the influx of "mass-market" no-code "beginners" is
>hurting the hobby? Fine. Teach the ignorant newcomers _why_ RF design
>and construction is important, and how it can be rewarding and useful.

No, not if they are interested in amateur RADIO, which also answers the second part of your comment. Just look at all the questions on this group which show that anything about antennas/propagation/equipment_internals/etc is black-magic to many hams - and this group represents some of the cream of ham radio. But at least these questions show that some people want to learn about radio. I don't expect pilots to design airplanes, but they should understand the rudiments of aerodynamics, engines, weather.

I think of ham radio as having substantial technical content.
I am out of date?

Hi out there,

Jan Geert described in his article a trunked mobile radio system. In my
opinion it is an implementation of the MPT 1327. This standard was defined by
the British Ministry of Post and Telecommunication (MPT), Department of Trade
and Industry, Radiocommunications Division in 1988. The standard was overtaken
by several European states, at least France and Germany. In Germany the
"Deutsche Bundespost Telekom' has licensed in several regions (e.g. in the
"Ruhrgebiet") trunked mobile radio systems.

To the technical part of the system:
(I try to summarize the informations I have)
- Structure of the system: cellular; if necessary several cells are combined to

a big system ofr covering an area.
- Diameter of a cell: 10 - 25 km for big areas
5 km for industrial zones
- separate channel for signalling data; e.g. connection establishment, exchange of ID's ...
- Speech transmission analog
- Data transmission: 2400 bit/s, FFSK ("0" - 1800 Hz; "1" - 1200 Hz)
- Signalling data is transmitted digital with 1200 bit/s
- Transmitted power: < 15 W erp (in Germany)
- Frequency range: 410 - 430 MHz (in Germany); the standard allows a freq range from 50 to 500 MHz
- Access to the Signalling channel: S-ALOHA
- possible call types: point-to-point, 'group'-call, broadcast, conference, call redirection, priority calls, emergency calls
- possible access to the telephone system (with tradeoffs caused by the half duplex in TMR)

There are a lot of different manufacturer for these units, the following list is a summary of the manufacturer I know and is not ment as an advertising in any sense.
Bosch, SEL/Alcatel, Nokia, Motorola, Rohde & Schwarz (for base stations [?]) and surely some other ...

I hope this informations helps a bit. The informations I got are mostly taken out of "Funkschau" a newspaper on radio communication (in German).

Bye es 73

I'm not one to talk, having passed 1(C) by the "Wheel of Fortune"
approach :-) but here's my suggestions:

Put the pen down and head copy. You don't write down the text
of a telephone call, why should a conversation via Morse code
be any different? This will be hard at first (It's certainly is
hard for me) but they tell me that it will become easy "after a
while". I *do* write down the things that I may want to refer
to later (callsign, name, QTH, RST...) but head copy the
rest of the stuff.

While studying, I worked at the 80% point. I used to head copy
random letter sequenced and used the 80% figure (4 out of 5 letters)
to determine how fast to run the machine for that session. On bad
days, I'd have to slow it down to get up to 80% and on good days,
I could raise it to the point where the comprehension dropped to
80%. Overall, the speed went up more than it went down.

I agree completely with your QSO per day method. Nothing beats
getting into regular ragchews to develop the CW skills.

Hi,

As the source of all kinds of good and valuable information I come
to the gurus of esoterica.

I have a TEK 4631 that does a good job and is still working. We have
a few systems, both Macintosh and PC that could use this to output lots of
useful data. However, we can't find a driver to make it do its stuff with
either the Mac or PC.

Does anybody have a driver or know of one? Commercial, shareware or
freeware?

Please reply directly as I am not on the PC side and generally late
on the Mac BBS side.

Thanx,
Sid Bernstein

Bill & all who are interested,

The rumor that Yaesu is bringing out a new Dual Band HT is TRUE. Yaesu has
been running ad's on the new unit in Radio Fun for the last 2 months or so.
Unfortunatly I do not have a copy of the Mag in my office (took the latest
issue out of by bag this AM :-( ). I believe the new model is called the
FT-530. I'll bring in the mag tomorrow and reply with more info then.

>
> Anyone know if they are "illegal" in Colorado?

Only three states have any type of "radar detector prohibition."
Virginia and Connecticut ban their use completely, while New York
has only baned their use by truckers. Virginia also now uses a
"radar detector detector" to try and identify passing cars that
have a radar detector. The "detector detector" is little more
than a very sensitive receiver that indicates the presence
of an RF siignal in the frequency range of the internal oscillator
of the typical radar detector.

As to the 1934 Commuunications Act ensuring your ability to use
a radar detector, that has (to the best of my knowledge) never
been tested before. I have heard, but have nothing specific to
cite, that those few cases where someone chooses to pursue such
a defense have always resulted in the state dropping the charges.
The idea here is that the state would rather let one person off than
risk going to a higher court and having the entire law prohibiting
radar detectors thrown out. This, of course, is only applicable
to Virginia, Connecticut and New York.

I offer the above comments based on my long standing membership in the
National Motorists Association and the information that has been
published over the last few years in the NMA's bimonthly
newsletters.

>residential "stealth" antennas?
>

Nah. Not so. I don't know of ANY place (aside from prison, maybe, and
I know of several where Amateur Radio is an integral entity!) that
forbids microwave work. If I want to run an IR or little GunnPlexer
unit right through the window of a condo or other place where antennas
are "forbidden" I certainly can.

Further, the notion that HF and FM repeaters is "all that's available"
to young hams just doesn't square with reality. I can recall making
many hundreds of contacts (many of them DX QSOs at that!) with all
my antennas being BELOW GROUND, SUBTERRANEAN, in the basement of my
condo, before I bought my house some years back.

How? The Amateur Satellite Service of course!

In fact, there's LOTS of wonderful things that newcomers can do,
in spite of what what we "Old Timers" incorrectly think of as
brick walls.

Our job, then, as seasoned veterans of the Amateur Radio Service is
to point out the HUGE variety of neat things that newcomers can do,
and strive to keep our negative (often wrong) opinions to ourselves.

Tough thing to do!

Source record: 288505

I will be on vacation in Colorado during Field Day this year, and I am presently building a 40-meter QRP rig to take along, in hopes of making a few contacts while I'm there. I've read the Field Day rules, and I'm assuming that since I'll be working Field Day from Colorado, I should identify myself with the Colorado section, even though I live in Kansas. Is this correct? (Forgive me if this is a stupid question--this is only my second Field Day, and I didn't really do much the first time.)

Of course, this may be a moot point if I can't get this rig working...:-)

Source record: 288507

Old-timers used to reckon you could make *anything* radiate if you knew how to couple power to it effectively.
Problem is, hams these days expect to *buy* an antenna, and commercial suppliers will take your cash willingly. Where's the experimenter-spirit that builds antennas out of discarded FM/TV beams (often available at no cost from your local friendly antenna-riggers. Dammit - some antenna riggers almost beg you to take the things away...!).
End-fed rain gutters, shunt-fed aluminum window-frames, base-loaded balcony-rails will all work on HF. For VHF, try an on-glass quad.

Me too, but...

>In article <162@arrl.org> jbloom@arrl.org (Jon Bloom) writes:
>>
>>Let me say first that I think Incentive Licensing (IL) was a bad idea.
>>It added little or nothing of value to ham radio and managed to anger
>>a lot of people--for good reason.
>
>Absolutely true. Not only did it anger people, but many stopped Elmering
>prospective hams. I watched three clubs die over this issue. Clubs were
>the primary recruiting tool for new amateurs during this period. Many
>sponsored high school clubs and held regular licensing classes. That's
>how I got into amateur radio. Much of this disappeared in the angry days
>following IL. Most attempts to bring it back have failed.

If there was any more cut-off-your-nose-to-spite-your-face reaction to
IL than this one, I haven't run across it. I, too, got licensed through
a club--after incentive licensing. I've belonged to several clubs over
the years. Each had a committed Elmering program. If they hadn't, I
wouldn't have belonged to them. Many, many clubs continued to support
ham radio, and I have to say that any club that gave up Elmering because
of IL must not have been very committed to the program--or the
hobby--to begin with. It's one thing to dislike something; it's
something else to pick up your bat and ball and go home in a snit.

>Part of that
>is the changing image of amateur radio, but part is due to the hiatus
>caused by the IL controversy.

Maybe. But you are extrapolating from a small sampling to a sweeping
generalization. You may be right; you may not. My point is that this
is sheer speculation. At least, *I'm* not aware of any real data to
answer the question one way or another. Are you?

>>But I don't buy the argument that
>>it was responsible for any significant loss of growth in the amateur
>>ranks. Even less do I think it had anything to do with the demise of US
>>equipment manufacturers. Keep in mind that at the same time US amateur
>>manufacturers were dying out, so were major US *consumer* electronics
>>manufacturers, and for much the same reasons: offshore competition
>>(initially Japanese) provided lower-cost products that were more
>>attuned to the wants and needs of the consumer. While it is true that

>>this all occurred at about the same time that IL came into being,
>>simultaneity doesn't imply causality. I've seen no compelling argument
>>that IL and the loss of US amateur manufacturers are related. And I'd
>>be curious to know how the Japanese manufacturers managed to flourish
>>in a market that IL had supposedly destroyed.
>
>Look back through QST archives and note when Japanese radios began to
>have a major impact on American hams. It was much later than 1968.
>The Japanese manufacturers moved in to fill an existing vacuum rather
>than actively displacing old line manufacturers.

If IL drove US manufacturers out of the market, how is it that those
manufacturers could operate in a market with a customer base of 260
thousand in 1965 but not in the 1975 market with 260 thousand?

>The reason the Japanese
>industry could flourish was that they had a bigger home market in Japan
>for their products than the entire American market represented. They
>still do, over 1,000,000 Japanese amateurs.

Why wouldn't this have been equally true even if IL had never happened?
The Japanese have driven US manufacturers out of practically every
mature mass electronics market. I know of no reason to think this
wouldn't have happened in the amateur market regardless of regulatory
action--short of restrictive trade legislation. They've even driven
them out of markets where there are far *more* customers in the US
than in Japan. Obviously there are factors at work here other than IL!

>>Now, about the growth question. I'm sure that IL had *some* effect
>>on growth, at least early on. But it's unclear how much. It *is*
>>true that after IL came into being in 1967 (privileges actually changed
>>in 1968 and 1969), growth was slow, it's also true that growth had
>>slowed *before* IL. From FCC PRB figures, here are the number of
>>licensed hams, 1965 to 1982:
>>
>>1965 260,301
>>1966 255,952
>>1967 256,998
>>1968 256,546
>>1969 264,601
>>1970 263,918
>>1971 264,374
>>1972 262,093
>>1973 253,357
>>1974 256,264
>>1975 260,091
>>1976 290,251
>>1977 328,648
>>1978 356,336
>>1979 373,779
>>1980 393,353

>>1981 398,829
>>1982 410,304
>>
>>Note that the biggest increase in the 1965-1975 decade occurred during
>>1969, just after IL took effect.
>
>Remember that amateur licenses ran for 5 years during this period.
>So you have to look at numbers five years down the road to get an idea
>of the effect of incentive licensing. Look at 1973 when the numbers
>dip below the 1968 count.

No, the effect should be immediate, as all those disgusted drop-outs
with one year left on the license (in 1967) failed to renew (in 1968),
with two years (in 1967) failed to renew (in 1969)... and nobody new
got licensed in 1968, 1969... because that horrible IL kept them out.
While the *total* effect would be seen in five years, you would begin
to see the effect immediately. Instead, you see mild growth. (I
wouldn't dwell too much on the +/- 5k deltas. They probably represent
normal variation during a slow growth period.) And you still haven't
explained why growth stopped *before* the advent of IL (see 1965-1967)
if IL is the primary cause of low growth.

>Growth doesn't really pick up until the
>FCC releases more *phone* spectrum to the general and advanced licensees.

I think it's highly likely that the growth boom is coincident with the
CB craze. I doubt that FCC subband tweaking had much to do with it.

>By the 1980s a whole new generation is entering amateur radio who don't
>know much about the debacle of the 60s. As far as they're concerned,
>it's just the way things are done.

Absolutely true. Which means that IL is not *inherently* a killer of
ham radio. It's deleterious effect was primarily in the anger that it
caused.

>>In 1955 there were (esimated) 150,000 amateurs. Obviously there was
>>massive growth between 1955-1965. What caused that growth to slow?
>>I don't know. It would take a serious scientific study to find out.
>>But it *did* slow, and *before* IL came into being. So to argue that
>>IL was responsible is ludicrous. One other interesting item from the
>>data is that there was a growth spurt in the late 70's (sometimes
>>known as "the CB boom"). Since there were no significant changes to
>>the IL structure during this period, it's hard to square the numbers
>>with the theory that IL was responsible for "two decades of stagnation."
>
>The late 1960s did see a substantial portion of the potential amateur
>population visiting Southeast Asia. Another large contingent was in
^^^^^^^^^^^^^^^^^^^^^^
nice way of putting it! :-)

>the streets of America. This had an impact on amateur growth to be
>sure. Unlike 1945 however, many of the returning radio trained servicemen
>*didn't* become amateurs. I *believe* that this was because they saw
>the IL structure as more of the mickey mouse BS they had been putting
>up with in the military and they'd had enough of that. Most probably
>became those "rebel" CBers of the mid-70s.

You may believe that, Gary, but you haven't put forth any evidence
to demonstrate it. To try to analyze ham radio growth relative only
to IL is hopeless. The external factors you mention almost surely
played a part, as did other economic and social factors. Attributing
everything bad that happened in ham radio from 1967 to 1980 to IL is
just unsupportable.

There is a feller out here [west] that runs code practice
continuously around 7.100 Mhz. He has quite a good signal
perhaps you can receive it from your QTH.

He is sending religious text, which I though was considered
inappropriate for amateur radio's non-sectarian policy.

>in Kansas. Is this correct? (Forgive me if this is a stupid
>question--this is only my second Field Day, and I didn't really do
>much the first time.)

There is no such thing as a dumb question - only dumb answers. You should
identify yourself with the section you are physically located in. This is
the case for all contests that I know of that exchange any QTH information.
Good luck with the rig, and I'll see you on 40 CW!!

After following this thread about the "Wouff-Hong" for a while, it finally became apparent. This sort of thing is why amateur radio is soooooo relevant to the youth of today. NOT.

C'mon now. A bunch of people going ga-ga over a couple dirty old pieces of wood hanging on the wall in Connecticut ? Secret initiation rituals ?

No wonder this hobby is known for its geekiness & nerdiness. When are we going to stop thinking that there's anything special about it ? Maybe thirty years ago, when people still sent telegrams and long-distance calls almost always were made by operators at cord switchboards and portable telephones were something only James Bond had in the movies.

Today ..... your major source of new hams (i.e., youth) would say "Get a life!"

I would close by saying that we must do a better job of promoting amateur radio, but after further thought merely ask "Why should we bother?"

>suppliers will take your cash willingly. Where's the experimenter-spirit

Wire antennas are so simple yet somewhat mysterious at the same time. I just cringe a the thought of new hams going out and BUYING a pre-assembled dipole antenna kit. What a waste of money. But many new hams don't believe that simple antennas work VERY well. After all, if it costs more then it has to work better, right :-)

Problems is, to the average person, ANTENNAS ARE BORING. A piece of wire. Big deal.

The manufacturers need to come up with all sorts of fancy gimmicks to convince you that their $89.95 piece of wire will work better than your $5.99 piece of wire :-)

If you want to try something different, tune around the shortwave fqys for the commercial stations. I enjoy copying cw from these guys. They send various texts such as weather and traffic, and use machines, so the reception is enjoyable. I listen to several and have the memories programmed in my DELTA II so I can flip through all the channels and find one that is doing something besides a "diddle message". WLO, WCC, KFS, and VAI are my favorites. GL

Source record: 288518
Cross-posted to: sci.electronics,rec.radio.amateur.misc

The advise about positioning intrigues me. My parents
live atop a big hill, and have an antenna in the attic of the
house. The antenna has of course lasted forever out of the
weather. The problem is that the house has aluminum siding, and
I wonder if that impedes good reception. They get the stronger
channels from up to 100 miles away, but I think they might do
better with an exterior mmounted antenna. Does aluminum siding
make an effective Faraday cage?

Thanks
jpp

What non-sectarian policy. What's dubious about this guy (and I
believe it's some Krishna stuff), is that by calling it code practice
he can get arount the fact that hams aren't allowed to broadcast.

It's kind of lousy code practice because it's done continuosly at
some relatively low speed like 8 WPM.

Turns out that Field day is coming up quite soon and I have located a simple lap top computer -- IBM PC compat, 640 K mem, 1.4 MB 3 1/2 inch disk for the event.

Never having used any logging software, I want to know what simple software should I go after to automate our dupe sheet process? Is there some public domain or shareware stuff I can pull off a net? Doesn't need to be fancy, cheap would be nice. I know, I should have thought of this sooner, but with only a week to go I don't have time to write something. (Besides, if a bug at 4 AM wipes out the log I don't want it to be *my* bug! :-)

From: dwilson@s850.mwc.EDU
Message-ID: <9206171834.AA21025@ucsd.edu>
Source record: 288522

The radioteletype signal report as 10.128 is a 50 Bd/850 Hz shift transmission by the USN at Cutler, Maine with center frequency 10.130 MHz. It is simultaneously transmitted on 7.455 and 11.6875 MHz. The callsign for Cutler is NAA. The HF site for Cutler USN is across the street from the huge VLF antenna. The above freqs were confirmned by a personal visit to the area.

>Try looking in Radio Fun.

>Maybe 73 too?

Sure enough, they advertise in 73 also. Too bad they're just above 10.5GHz,
but they do appear to be Part 15 devices. Here is the text of the ad.

X-BAND TRANSMITTER

Miniature (2.25 x 3.75 x 1") GaAs microstrip transmitter provides
10 dBm centered at 10.525 GHz. Integrated microstrip patch antenna
eliminates the need for an external antenna. Advanced matching
techniques secured good temperature stability with low frequency pulling.
Great for long-range testing of radar detectors, calibration of radar
recieving equipment, and point-to-point communication links.

Complete Assembled System.....$39.00
Parts & Instruction Kit.....$29.00
Plus $2.00 Shipping and Handling

1 INTRODUCTION

We at Alinco would like to thank you for purchasing the ALINCO DJ-580T (US Model)/DJ-580E (European Model). Radios and other products made by ALINCO rank as some finest in the world. Your DJ-580T/E has been manufactured and tested very carefully at the factory and will give you satisfactory operation for many years. We are confident that you will be very satisfied with your choice of this fine ALINCO radio.

1.1 STANDARD ACCESSORIES

When you unpack your ALINCO transceiver, you will find the standard accessories which include:

1. Ni-Cad Battery Pack (7.2V @ 700mAH).EBP-20N
2. AC Wall Charger for EBP-20N.....EDC-24 (120V) DJ-580/T
3. Belt Clip
4. Hand Strap
5. Dual Band Rubber Flex Antenna
6. Schematic Diagram
7. Instruction Manual
8. Warranty registration card

1.2 OPTIONAL ACCESSORIES

To enhance your DJ-580 radio further, optional accessories are available. At ALINCO, we strongly recommend that you purchase appropriate accessories to get full features and performance from your radio.

1. Ni-Cad Battery Pack (7.2V @ 700mAH).EBP-20N
2. Ni-Cad Battery Pack (12V @ 700mAH) .EBP-22N
3. Dry Cell (6-AA) Pack EDH-6
4. Quick Ni-cad battery charger EDC-34
5. Mobile DC Power Cable/Charger
with Noise Filter. . .EDC-36

w/o. EDC-43
6. Earphone EME-6
7. DC cable for power supply. EDC-37
8. Earphone/Earphone. EME-6
9. Earphone/Microphone w PTT. EME-11
10. Speaker/Microphone EMS-2Z
| *11. Remote Control Speaker/Microphone. .EMS-8Z
12. Headset with PTT/VOX EME-10K
13. Soft Case. . . . . .ESC-17 for EBP-20N or EDH-6
14. Tone Squelch Unit. .(580-E). EJ-12U

| * = This Speaker/Mic has 3 keys. One key is marked with an Up arrow, another with a down arrow. These are used to increment and decrement frequency or memory channel. The last key is labeled "A" and toggles between the memory and vfo function.

2 SPECIFICATIONS

The specifications outlined for this product are for use in the amateur bands only. No guarantee or warranty, either specific or implied, will apply to any function or specification outside the amateur bands. Individual radios may experience different performance and/or specification levels. All specifications and features are subject to change without notice or obligation.

2.1 GENERAL SPECIFICATIONS

Channel Spacing: 5, 10, 12.5, 15, 20, 25 kHz steps
Memory Channels: 42 Channels (20 VHF, 20 UHF)
1 VHF Call Channel
1 UHF Call Channel
Antenna Impedance: 50 Ohms unbalanced
Microphone Input Impedance: 2K Ohms
Signal Type: F3
Power Supply Requirements: 13.8 Volts DC
Dimensions (Radio Only):
Height = 140mm (4 1/8")
Width = 58mm (2 1/2")
Depth = 33mm (1 1/2")
Weight: Approximately 410g
DTMF: 16 Button Key Pad
Subaudible Tones: Encode and Decode installed

2.2 U.S. FREQUENCY COVERAGE

The frequency coverage listed as follows applies to the DJ-580T.

VHF Band: 144.000 - 147.995 MHz (TX)
130.000 - 173.995 MHz (RX)
110.000 - 173.995 MHz (RX)* Only after Modification

UHF Band: 440.000 - 449.995 MHz (TX)
420.000 - 479.995 MHz (RX)
850.000 - 975.000 MHz (RX) Only after Modification

| * Band coverage may vary. Refer to "tone frequency decimal point"
for more information.

2.3 EUROPEAN FREQUENCY COVERAGE

The frequency coverage listed as follows applies to the DJ-580E.

VHF Band: 144.000 - 145.995 MHz (TX)
130.000 - 173.995 MHz (RX)
130.000 - 173.995 MHz (RX)* Only after Modification
UHF Band: 430.000 - 439.995 MHz (TX)
420.000 - 479.995 MHz (RX)
850.000 - 975.000 MHz (RX) Only after Modification

| * Band coverage may vary. Refer to "tone frequency decimal point"
for more information.

2.4 TRANSMITTER SPECIFICATIONS

Output Power: 2 Watts with Standard EBP-20N Battery
5 Watts with Optional EBP-22N Battery
Modulation System: Variable reactance FM
Max. Freq. Deviation: +/- 5kHz
Spurious Emission: Less than 60dB below carrier

Tone Frequency: 67.0 to 250.3 Hz (38 selections)
DJ-580T (Subaudible Encoding Tone)
DJ-580E (1,750 Hz Tone Burst)
Microphone: Electret Condenser
Operating Mode:
Simplex:
Duplex: 5kHz steps minimum between 0-15.995 MHz
from receiver frequency.
CTCSS Encoder: Built-in and included as standard
CTCSS Decoder: Built-in and included as standard

2.5 RECEIVER SPECIFICATIONS

Receiver System: Superheterodyne, Dual Conversion
Sensitivity: 12dB SINAD less than - 15dB per microvolt
Intermediate Frequency: VHF - 1st IF 55.05 MHz
2nd IF 455 kHz
UHF - 1st IF 58.125 MHz
2nd IF 485 kHz
Audio Power Output: 250 mw (10% Total Harmonic Distortion)
Speaker Impedance: 8 Ohms

2.6 BATTERY SPECIFICATIONS

The "PO" function selects output power levels. The transmitter output power is determined by battery type and output power setting.

2.6.1 EBP-20N BATTERY SPEC

The EBP-20N is supplied with your radio when purchased.

PO FUNCTION

Battery Capacity: 700 mAh
Output Voltage: 7.2 Volts
PO (Power Output Function): L - 0.25 Watt output power
M - 1.00 Watt output power
H - 2.50 Watts output power

Charge Times and Chargers: EDC-34 (120V) Approx. 1 Hour
EDC-35 (220V) Approx. 1 Hour
EDC-24 (120V) Approx. 14 Hours
EDC-25 (220V) Approx. 14 Hours

Charging Temperature: 0 to +45 Degrees C
Storage Temperature: -20 to +45 Degrees C

2.6.2 EBP-22N BATTERY SPEC

The EBP-22N is supplied with your radio when purchased.

PO FUNCTION

Battery Capacity: 700 mAh
Output Voltage: 12.0 Volts
PO (Power Output Function): L - 0.25 Watt output power
M - 1.00 Watt output power
H - 5.00 Watts output power

Charge Times and Chargers: EDC-34 (120V) Approx. 1.8 Hours
EDC-35 (220V) Approx. 1.8 Hours
EDC-24 (120V) Approx. 14 Hours
EDC-25 (220V) Approx. 14 Hours

Charging Temperature: 0 to +45 Degrees C
Storage Temperature: -20 to +45 Degrees C

2.7 GENERAL POWER READINGS

This subsection is made available to users of the electronic version of the DJ-580 manual only. The author of this manual has made these power readings available to you. These readings are approximate and should be treated as such.

Baseline: 7.2 Volt Pack = 8.50 Fresh Charge

Note: All Ratings are in Milliamps and are approximated.

Low High
--- -----
VHF Only UHF Muted..... 58-65 ma
UHF Only VHF Muted..... 54-57 ma
Both bands active..... 100-105ma

The following ratings are approximated and based on Both bands active.
Item rating Total Reading
Low High Low High
---------- ---------------
Any Key pressed..... 3 - 5 ma 103 - 109 ma
LMP (Lamp On)..... 56 - 61 ma 156 - 162 ma
Squelch open (No volume)..... 10 - 15 ma 110 - 119 ma
Squelch open (Full Volume).... 70 - 77 ma 170 - 181 ma
Function Button Pressed..... .3 - .5 ma 100.3-104.5ma
Battery Saver (Deduction)..... 35 - 70 ma Erratic

3 DESCRIPTIONS

This section will discuss what the function or control is and how to use it. The subsections are broken down into smaller sections for easy access.

3.1 FRONT PANEL CONTROLS/FUNCTIONS

The following descriptions are those functions necessary to utilize full functionality of the DJ/580T/E.

(1) LCD DISPLAY PANEL

Refer to Section 3.5 for further details on the LCD display panel.

(2) CONTROL KEYPAD

The control pad includes 16 multi-functional command keys that control and execute various operations for the DJ-580T/E. It also serves as a DTMF keypad.

(3) MICROPHONE

An electret condenser microphone is built into the front panel. When transmitting, speak directly into the microphone from a distance of approximately 5 inches. The speaker/microphone connectors are labeled as follows:

Smaller Jack
(MIC JACK): Tip: PTT Line/Transmit Audio
Ring: 5VDC (for EME-10K option)
Sleeve: Signal Ground

Larger Jack
(SPEAKER JACK): Tip: Receive Audio
Ring: Remote Control (for EMS-8 option)

Sleeve: Signal Ground

If you decide to use the V.U.SP jack while using the SPeaker jack, the VHF audio will not be heard. The VHF audio is routed through the V.U.SP jack.

(4) SPEAKER

The speaker is located below the key pad on the front panel. It's rated at 8 ohms and not in operation when an external speaker is used.

(5) VHF BAND KEY

Pressing this key allows for operation on the 2 meter VHF band.

(6) UHF BAND KEY

Pressing this key allows for operation on the 70 cm UHF band.

(7) SHIFT KEY

The SHIFT KEY is used to change frequency offset and shift.

The symbols - , + and star symbol are used to indicate shifts.

1. Press and hold the FUNC key, then press the SHIFT key repeatedly until the desired shift appears on the LCD display.

The - symbol indicates that the transmitter will subtract the offset with the transmitted frequency.

The + symbol indicates that the transmitter will add the offset with the transmitted frequency.

| The star symbol indicates a split offset. Refer to Section 9.1 for more information.

Simplex operation is active when neither the - or + or star symbol is displayed on the LCD display. If OFF appears in place of the frequency during transmit, the selected frequency is out-of-band.

2. Select the Main Band by pressing the VHF or UHF key. The LCD display returns to frequency.

*** NOTE ***

For larger incremental frequency changes press and hold the FUNC key then rotate the Main Tuning dial. This increments the 1MHZ digit.

Amateur radio repeaters utilize separate transmitter and receiver sections. The transmitter frequency may be offset either above or below the receive frequency according to repeater coordination conventions. The standard offset for the 2 meter band is 600 Khz. Offset for the 70cm band is 5 Mhz. Offset direction varies according to established band plans.

EXAMPLE: SHIFT

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the SHIFT key. An offset will be displayed on the LCD display.

3. Rotate the Main Tuning dial or press either arrow key to select the desired offset. For larger incremental frequency changes, press the FUNC key then rotate the Main Tuning dial.

4. Select the Main Band by pressing the VHF or UHF key or PTT key to complete offset procedure.

DJ-580T DJ-580E

VHF: 600 Khz (0.60) VHF: 600 Khz (0.60)
UHF: 5 Mhz (5.00) UHF: 7.6 Mhz (7.60)

(8) STEP KEY

The STEP function is used to select desired incremental changes of receive/transmit frequencies, in steps of 5, 10, 12.5, 15, 20 or 25Khz. Get more information on "GETTING | STARTED" in section 4. The step rate changes when in other | frequency regions (See Airband Receive Modification).

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the STEP key. The channel step will change each time the STEP key is pressed. You can also change the channel step by using the Main Tuning dial, UP ARROW or DOWN ARROW keys.

3. Select the Main Band by pressing the VHF or UHF key to set channel step and return to operating frequency.

After channel step is set, the receive/transmit frequency will increase or decrease by the value selected when you turn the Main Tuning dial.

When the transmit frequency extends beyond permissible limits, Off will be displayed on the LCD display. The transmitter will not transmit when Off is displayed.

Refer to the following OFFSET frequency chart (TABLE 1) before you actually transmit. The transmitting frequency

may differ from the frequency that appears on the lcd display.

LCD DISPLAY FREQUENCY ACTUAL FREQUENCY

***.*02.5 Khz ***.*00.0 Khz
***.*07.5 Khz ***.*05.0 Khz
***.*17.5 Khz ***.*15.0 Khz
***.*22.5 Khz ***.*20.0 Khz
***.*27.5 Khz ***.*25.0 Khz
***.*32.5 Khz ***.*30.0 Khz
***.*42.5 Khz ***.*40.0 Khz
***.*47.5 Khz ***.*45.0 Khz
***.*52.5 Khz ***.*50.0 Khz

***.*97.5 Khz ***.*95.0 Khz

TABLE 1 OFFSET FREQUENCY CHART

(9) REV KEY

The REV key allows instant reversal of the REV function is also useful to check the repeater input to determine if another station is heard directly so you can go simplex. To activate the REV function:

1. Press and hold the FUNC key, then press the REV key. The repeater input frequency and opposite SHIFT indicator will appear on the LCD display panel.

2. Press and hold the FUNC key, then press the REV key again to cancel the REV function.

If the frequency, as a result of the REV key being activated, is out of band, the beep will sound and no change will take place. The beep won't be heard through the speaker if it has been turned off.

(10) TONE KEY

The Tone Encoder and Tone (Decoder) Squelch function is standard on the DJ-580T/E. Tone Encode and Decode work on the Main Band only. The DJ-580T/E has 38 settings from 67.0 hz to 250.3 hz (TABLE 2). Utilize the TONE key to access these settings. Access to an increasing number of repeaters is restricted by requiring that a sub-audible tone be transmitted with the input signal to open the repeater. To select the needed tone, perform the following:

1. Press and hold the FUNC key, then press the TONE key. A tone frequency will appear in the LCD display.

2. Rotate the Main Tuning dial or either the UP ARROW or DOWN ARROW key to the desired tone frequency.

3. Select the Main Band by pressing the VHF or UHF key.

4. The tone has now been selected, now you need to enable it. Press the T.SQL key.

Refer to section 9.4 for more information.

Sub-Audible Tone Chart
======================================
67.0 71.9 74.4 77.0 79.7 82.5
85.4 88.5 91.5 94.8 97.4 100.0
103.5 107.2 110.9 114.8 118.8 123.0
127.3 131.8 136.5 141.3 146.2 151.4
156.7 162.2 167.9 173.8 179.9 186.2
192.8 203.5 210.7 218.1 225.7 233.6
241.8 250.3

TABLE 2 SUB-AUDIBLE TONES

(11) PO KEY

Change power output levels by performing the following.

1. Press and hold the FUNC key, then press the PO key repeatedly to obtain the desired output power.

When H is displayed it means that the output power is at maximum/high for battery rating. When M is displayed it means that the output power is at mid range for battery rating. When L is displayed it means that the output power is at the lowest range for battery rating. Refer to the battery specifications for more on output levels.

*** WARNING ***

It is possible to cause UHF receive interference while transmitting on VHF. To avoid this from happening, make sure that the VHF frequency x 3 does not equal the frequency on UHF. For example, if VHF transmit frequency is 146.190 the UHF frequency should not be set at 438.570.

(12) T.SQL KEY

The Tone Encoder and Tone (Decoder) Squelch function is standard on the DJ-580T/E. Tone Encode and Decode works on the Main Band only. In other words, it is expected that you can only speak on one band at a time. When changing over to the other band, another tone may be used. Further clarification is made in the cross band repeat section. The DJ-580T/E has 38 settings from 67.0 hz to 250.3 hz (TABLE

3). Utilize the TONE key to access these settings. Access to an increasing number of repeaters is restricted by requiring that a sub-audible tone be transmitted with the input signal to open the repeater. To select the needed tone, perform the following:

1. Press and hold the FUNC key, then press the TONE key. A tone frequency will appear in the LCD display.

2. Rotate the Main Tuning dial or either the UP ARROW or DOWN ARROW key to the desired tone frequency.

3. Select the Main Band by pressing the VHF or UHF key.

4. Press and hold the FUNC key, then press the T.SQL key to display T and enable subaudible tone encoding. If T and SQL display, then tone squelch or tone decoding is enabled.

The tone frequency is now stored and will be transmitted with the repeater input frequency.

Sub-Audible Tone Chart
======================================
67.0 71.9 74.4 77.0 79.7 82.5
85.4 88.5 91.5 94.8 97.4 100.0
103.5 107.2 110.9 114.8 118.8 123.0
127.3 131.8 136.5 141.3 146.2 151.4
156.7 162.2 167.9 173.8 179.9 186.2
192.8 203.5 210.7 218.1 225.7 233.6
241.8 250.3

TABLE 3 SUB-AUDIBLE TONES

(13) BEEP KEY

When the BEEP is on, each key pressed will sound a BEEP.

1. Press and hold the FUNC key, then press the BEEP key. Each time the BEEP key is pressed the speaker will emit a high or low pitch tone. If the tone is high pitch, the BEEP is disabled, if low it is enabled.

The BEEP function, when set, will be activated on both bands. The BEEP will sound only if the BEEP function is on.

The radio comes preset with a low/soft beep audio level. If you would like to increase this level to high, perform the following.

1. Press and hold the FUNC key, then press the * key. The LCD will display FL.

2. Press and hold the FUNC key, then press the STEP key. The display will indicate bEEPH, for beep tone high

level audio.

3. Press and hold the FUNC key, then press the STEP key. The display will indicate bEEPL, for beep tone low level audio.

4. Press and hold the FUNC key, then press the * key three (3) times to clear FL/PL from the display and exit beep tone level mode.

(14) TMS/VCS KEY

This key is used to select 1 of 3 scan modes. Refer to section 8.3 for more information.

(15) APO KEY

This APO key is used to Automatically Power Off the radio. The APO function prevents inadvertent waste of battery power when the radio is left ON unintentionally. Here's how to use it.

1. Press and hold the FUNC key, then press the APO key. You will see APo 30 displayed.

2. The time of 30 minutes is preset from the factory. The time duration can be selected by rotating the Main Tuning Dial. The time is adjustable from 5 to 60 minutes.

3. Press and hold the FUNC key, then press the APO key. APO is displayed on the LCD.

If no activity, a beep is emitted after this time and 30 seconds later the LCD display becomes blank. Battery power has now been removed from the radio. To re-initialize APO, turn the radio off and back on again.

4. Exit the APO function, select the Main Band by pressing the VHF or UHF key. The APO indicator should still be displayed on the LCD.

5. To cancel APO, press and hold the FUNC key, then press the APO key 2 times. The APO indication should now disappear from the display. Exit the APO function, select the Main Band by pressing the VHF or UHF key.

Any signal received during the APO time period, APO resets back to the beginning.

(16) DOWN ARROW AND FL/PL KEY

The DOWN ARROW toggles different values depending on what task you are utilizing. It is often used to decrease VFO frequency value. If this key is held

down, the value will decrease continuously.

FL stands for Frequency Lock. In this mode the main keypad, SCN/PS and CALL/W keys are locked and don't function.

PL stands for Push To Talk Lock. In this mode both bands are locked from the Push to Talk switch. Frequencies can still be entered and stored.

These are useful features to prevent unauthorized functioning while the radio is in unattended monitoring mode. Here's how to use these features.

1. Press and hold the FUNC key, then press the FL/PL key. Each time you press the key, you will toggle the field which will be displayed as follows: FL, PL then FL and PL and finally both functions disabled.

(17) DUAL KEY

This function is used to monitor two particular channels. The possibilities are:

o VFO and MEMORY channels
o VFO and CALL channels
o VFO and VFO channels
o CALL and MEMORY channels

In other words, dual channel monitoring will listen to two channels. Here's how to make it happen for VFO and MEMORY. You can incorporate the same procedure with the other possibilities of DUAL WATCH.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the MR key. Select the desired memory channel by using the Main Tuning Dial.

The 2 digit memory channel number will blink if it hasn't been programmed. More on memory channel programming can be found in section 6.2.

3. Return to VFO Mode and enter a VFO frequency.

4. Press and hold the FUNC key, then press the DUAL key. The PRI indicator will now blink on and off on the display. The radio will cycle alternately between VFO frequency and Memory frequency for 1/2 second.

5. When a signal is received, the signal is held for 5 seconds.

6. To release the DUAL/WATCH function, press the PRI or chosen VFO key.

(18) UP ARROW AND MESS KEY

The UP ARROW toggles different values depending on what task you are utilizing. It is often used to increase VFO frequency value. If this key is held down, the value will increase continuously.

This MESS key is used for Digital Signal messages. Refer to section 11.7.

(19) PRI/DIAL M KEY

PRI stands for Priority. When the PRI key is pressed the priority function is active.

The DIAL M key is used for storing and automatically transmit a sequence of numbers/codes. This would be commonly used for autopatch use. Refer to section 10 for more information.

(20) GP DSQ/DSQS KEY

This key is used in conjunction with DTMF squelch control. More information can be found in section 11.

(21) SKIP/M TO V KEY

The SKIP key is used to skip selected memory channels during a memory scan.

The M to V function of this key is used to copy information from a memory location into the vfo.

(22) MR/MW KEY

MR stands for Memory Read. This function is used to examine what information is in a memory channel.

MW stands for Memory Write. This function is used to write/store frequencies and features into a memory channel. Refer to section 6.2 on for more information.

1. Press the MR key to put the Main Band into Memory Channel mode. A 2 digit memory channel number (0-19) will appear. These 2 digits will flash if nothing has been programmed into the memory channel.

2. Pressing the SCN key will increment each programmed memory channel one at a time. Use the Main Tuning Dial to either increment or decrement scanning.

(23) SCN/PS KEY

The SCN key is used to continually scan frequencies in VFO or memory mode. Press the key down for approximately one second and scan will begin. Scan is active by virtue of the flashing decimal point, just right of the 1 megahertz

digit. To cease scan, press the SCN key once again.

PS stands for Programmable Scan. This is used when you want to scan a range of frequencies. You may scan a range of frequencies on VHF and perform the same for UHF at the same time. Here is how it works.

1. Select the Main Band by pressing the VHF or UHF key.

2. Now enter the lower range frequency via the keypad.

3. Press the MR key. Rotate the Main Tuning Dial and select memory channel P1.

4. Press and hold the FUNC key, then press the MW key. A beep will sound from the speaker and memory channel P1 will stop blinking. P1 has been successfully programmed with the lower frequency.

5. Now enter the higher range frequency via the keypad.

6. Press the MR key. Rotate the Main Tuning Dial and select memory channel P2.

7. Press and hold the FUNC key, then press the MW key. A beep will sound from the speaker and memory channel P2 will stop blinking. P2 has been successfully programmed with the upper frequency.

8. Select the Main VFO band as you did in step 1.

9. Press and hold the FUNC key, then press the PS key. The display will show scanning of ranges programmed between P1 and P2. The P indicator should begin to blink on the LCD display.

10. Exit programmable scan, select the Main Band by pressing the VHF or UHF key or SCN key.

| If you are scanning (SCN) or manually tuning, consider
| the following.

| o When passing a 500kHz boundry, a single beep will be
| heard through the speaker.

| o When incrementing frequencies past a 1MHz boundry, a low
| beep followed by a high beep will be heard through the
| speaker.

| o When decrementing frequencies past a 1MHz boundry, a
| high beep followed by a low beep will be heard through
| the speaker.

o The Battery Saver feature will not function when in the
| SCN function, even though the BS indicator is displayed
| on the LCD.

(24) CALL/CALL.W KEY

Each band has 1 Call channel which is immediately accessible by pressing the CALL key. An often used frequency of interest such as a preferred local repeater, is usually programmed into the Call channel.

The CALL key is used to gain access to the CALL channel.

The CALL.W key is used to write information into the CALL channel.

Refer to section 6.3 for more information.

(25) LAMP KEY

1. Press the LAMP key to illuminate the LCD display. The lamp goes out automatically after five seconds.

2. If you wish for the lamp to remain on, press and hold the FUNC key, then press the LAMP key.

(26) MONI/BS KEY

MONI is short for the word MONITOR or SQUELCH OPEN. Activate this feature as follows:

1. Press and hold the MONI key to override the squelch on the band selected. In this mode, weak signals below the squelch threshold may be heard.

BS is short for Battery Saver. The battery saver feature reduces unnecessary battery drain by alternating between listening and the Battery Saver mode. If there is no operation for a period of 5 seconds the BS mode will listen for a signal for approximately 130 ms then Battery Save for approximately 390 ms. This cycle is repeated continuously. Perform the following to activate or deactivate Battery Save feature. You can set this function in VHF or UHF or both bands together.

1. To activate battery save feature, press and hold the FUNC key, then press the BS key until the symbol S is displayed.

2. To deactivate battery save feature, press and hold the FUNC key, then press the BS key until the S disappears.

*** NOTE ***
Battery Saver is not active during SCN function, even though SCN is displayed on the LCD.

3.2 TOP PANEL CONTROLS/FUNCTIONS

(1) BNC ANTENNA CONNECTOR

You should attach a suitable Dual-Band antenna that will yield a low SWR. The antenna connected should satisfy both the 2 meter and 70 cm (440MHz) band.

(2) VHF VOLUME CONTROL

Adjusts the VHF audio level. Rotate control clockwise to increase volume , and counter clockwise to decrease.

(3) VHF SQUELCH

Start by turning the knob fully counter clockwise, then rotate the knob back clockwise until background noise is silent.

(4) POWER ON/OFF AND UHF VOLUME CONTROL

Power is not applied to the radio when the POWER knob is fully counter clockwise. When the POWER knob is rotated clockwise, power is applied to the radio and volume for the UHF band may be adjusted.

(5) UHF SQUELCH

Start by turning the knob fully counter clockwise, then rotate the knob back clockwise until background noise is silent.

(6) MAIN TUNING DIAL

Press the VHF or UHF key to select the Main Band. The Main Tuning dial may be rotated in either direction to select transmit and receive frequencies, frequency steps, subaudible tones and transmit frequency offsets. The frequency will increase/decrease by one MHz depending on the direction of the tuning dial rotation.

(7) SPEAKER JACK

An external speaker rated at 8 ohms may be plugged into this jack. The built-in speaker is disabled when an external speaker is plugged into this jack.

If you decide to use the V.U.SP jack while using the SPeaker jack, the VHF audio will not be heard. The VHF audio is routed through the V.U.SP jack.

(8) MIC JACK

An external microphone may be plugged into this jack.

(9) V.U.SPEAKER JACK

The DJ-580T/E features an external 1/8" stereo jack that makes accessible the audio supplied from each band (UHF/VHF). When a stereo headset is used, each band is heard separately, in each earphone. Separate external speakers may be plugged into this jack by using a mini dual stereo adapter plug. Volume from the VHF band will be heard on the left channel and UHF will be heard on the right channel. It is advisable to use the SPeaker jack when using a mono plug.

*** NOTE ***

When this jack is in use, the speaker jack located on the top of the radio will be disabled.

If you decide to use the V.U.SP jack while using the SPeaker jack, the VHF audio will not be heard. The VHF audio is routed through the V.U.SP jack.

3.3 LEFT SIDE CONTROLS/FUNCTIONS

The following controls are located on the left side of the radio as viewed with front panel facing the operator.

(1) FUNCTION KEY

Controls access to secondary functions. These secondary functions are those functions printed in green on the front panel. It is necessary to activate the Function key to access these secondary functions. While holding the FUNC key, press the desired command key.

(2) PTT SWITCH

Press and hold this button to transmit. While holding the PTT SWITCH you may speak into the microphone.

*** NOTE ***

On the DJ-580E the lower portion of the PTT SWITCH is used to transmit Tone Burst, and the upper portion is the PTT SWITCH. On the DJ-580T either button activates PTT SWITCH.

(3) BATTERY LOCK BUTTON

The battery lock button releases the battery from the radio. The battery is keyed in order to avoid the battery from being inserted incorrectly. To attach the battery, slide battery in guides from left to right until the lock snaps battery into place. To remove battery, push and hold the lock button upwards and slide the battery to the left (from vantage point where radio front panel is facing you).

3.4 RIGHT SIDE CONTROLS/FUNCTIONS

The following controls are located on the right side of the radio as viewed with front panel facing the operator.

(2) DC IN JACK

Utilizing this jack will provide maximum output power. Plug an external 13.8 VDC power source into this jack.

*** CAUTION ***

Observe correct plug polarity. The tip of the connector is (+) and the sleeve is (-).

When a voltage source is applied to this jack the battery is cutoff and no charging to the battery will take place.

The EDC-36 or EDC-37 is recommended as optional accessories. Refer to section 1.2 for additional information on OPTIONAL ACCESSORIES.

3.5 LCD DISPLAY DESCRIPTIONS

(1) MEMORY CHANNEL

This 2 digit indicator shows that the selected band is in memory mode and displays the memory channel number.

(2) BATTERY SAVE

The symbol S appears while battery save function is activated.

(3) TONE ENCODER/TONE SQUELCH

The symbol T appears when tone encoder is active and TSQL when tone squelch (Decode) function is activated.

(4) PRIORITY/DUAL WATCH

The symbol PRI appears when PRIORITY/DUAL WATCH function are activated.

(5) AM

This symbol will appear when the aircraft modification has been performed. The symbol AM indicates that the AM detector is active.

(6) SPLIT

The star symbol appears when the split function is activated.

(7) TIMER SCAN

This T symbol appears above the (frequency) 10kHz digit. This symbol indicates that BUSY SCAN is activated. When the T symbol disappears, TIMER SCAN is activated.

(8) OUTPUT POWER

When the symbol L is displayed, LOW power is active. The indicator M is for MID power and H for HIGH power.

(9) DIALER

When the ~ symbol appears, the DIALER MEMORY is activated.

(10) SHIFT

The symbols +, - or star are used by the shift function.

(11) DSQ

When P or G and DSQ are displayed, DSQ functions are enabled. DSQ stands for DTMF squelch control.

(12) VHF

The VHF symbol indicates that the VHF band has been selected.

(13) FREQUENCY INDICATOR

Receive and transmit frequencies, offset and tone frequencies, channel steps, DSQ codes and dialer memory channel numbers are displayed in this area depending on the selected mode.

(14) AUTO POWER OFF

APO appears when AUTO POWER OFF is activated.

(15) ON AIR

The symbol ON AIR appears when transmitting.

(16) S/RF

In receive mode the S/RF symbol and Signal/RF bars will be displayed to show signal strength. When transmitting occurs, the ON AIR symbol and Signal/RF bars indicate RF output power.

(17) FREQUENCY DECIMAL POINT

When receive, transmit or offset frequencies are displayed on the LCD, the decimal point divides MHz and kHz.

(18) TONE FREQUENCY DECIMAL POINT

When the Tone frequency is displayed, the decimal point divides Hz and 0.1 Hz.

*** NOTE ***

This decimal point is also used to indicate that the PLL circuitry isn't locking in on the frequency entered. In

other words, you are unlikely to receive the frequency that you have entered when this decimal point is blinking within the frequency displayed on the LCD.

(19) PL (PTT LOCK)

The PL symbol indicates that the PTT switch is locked. The radio will not transmit even if the PTT switch is pressed accidentally.

(20) FL (FREQUENCY LOCK)

FL stands for FREQUENCY LOCK. When FL is displayed, the command and control function keys are locked out. Utilizing this function prevents accidental use of command and control pad keys.

(21) UHF

This symbol indicates that the UHF band has been selected.

4 GETTING STARTED (RECEIVING)

1. Adjust the following switches and controls on the top of the radio.

o POWER/UHF KNOB: OFF
o VOLUME CONTROLS: Fully Counter Clockwise
o SQUELCH CONTROLS: Fully Counter Clockwise

2. Connect a battery or external 13.8 Volt DC Power Supply to the radio.

3. Connect an antenna with the appropriate antenna connector to the top of the radio. The type of antenna fitting that is expected is a BNC type.

4. Rotate the POWER knob clockwise until power is applied to the radio.

5. Rotate the VHF volume control (left knob) and the UHF volume control (center knob) clockwise until a signal (or noise) is heard through the speaker. The display should be illuminated and indicate frequencies for both bands. The initial factory delivered settings for VHF are found in Table 4, UHF in Table 5.

VHF

VFO Frequency: 145.000 MHz DSQ Setting: None
Memory Frequency: Empty Call Frequency: 145.000 MHz
Channel Step(580T): 5 kHz Tone Setting: None
Channel Step(580E): 12.5 kHz Tone Frequency: 88.5
Shift: None Transmitter Output: Mid
Offset Frequency: 0.6 MHz Call Freq.(580T): 145.000 MHz

Memory Channel: 1 Call Freq.(580E): 145.000 MHz

TABLE 4 VHF DEFAULT SETTINGS

UHF

VFO Freq. 580T: 445.000 MHz DSQ Setting: None
VFO Freq. 580E: 433.000 MHz Call Freq.(580T): 445.000 MHz
Memory Channel: 1 Call Freq.(580E): 433.000 MHz
Channel Step(580T): 5 kHz Offset Freq.(580T): 5 MHz
Channel Step(580E): 12.5 kHz Offset Freq.(580E): 7.6 MHz
Shift: None Tone Frequency: 88.5 Hz
Tone Setting: None Transmitter Output: Mid

TABLE 5 UHF DEFAULT SETTINGS

6. Rotate the Main Tuning dial, and select an open frequency on each band. Rotate the squelch control counterclockwise for each band until the S/RF indicator disappears from each band on the LCD display.

7. Select the desired band by pressing the VHF or UHF buttons. The VHF symbol will display on the LCD when VHF is enabled. The UHF symbol will display on the LCD when UHF is enabled.

*** NOTE ***

When the external power source is connected, make sure you power off the radio before turning off the power supply.

4.1 KEY PAD DIRECT ENTRY

When frequency is selected by key pad direct entry, numbers will appear on the LCD display as they are entered on the key pad.

To enter frequency directly from the key pad, try the following. The following example will use the two meter frequency 146.52.

1. Select the Main Band by pressing the VHF or UHF key.

2. Enter the 100MHz digit first. Example: 1--.---

3. Enter the 10MHz digit next. Example: 14-.---

4. Enter the 1MHz digit next. Example: 146.---

5. Enter the 100kHz digit next. Example: 146.5--

6. Enter the 10kHz digit next. Example: 146.52-

7. Enter the 1kHz digit last. Example: 146.520

If radio STEP is greater than 10kHz, the 10kHz digit will be the last digit to enter followed by a higher pitch beep.

If radio STEP is selected for 5kHz, enter the last digit.

4.2 STEP KEY

The STEP function is used to select desired incremental changes of receive/transmit frequencies, in steps of 5, 10, 12.5, 15, 20 or 25kHz. Use this feature as follows:

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the STEP key. Change the channel step by using the Main Tuning dial, A/UP ARROW or B/DOWN ARROW keys.

3. Select the Main Band by pressing the VHF or UHF key to set channel step and return to operating frequency.

4. After channel step is set, the receive/transmit frequency will increase or decrease by the value selected when you turn the Main Tuning dial.

*** NOTE ***

The following rules apply to channel steps as indicated.

When 5 kHz channel step is selected, keys 0 and 5 are available for entry into the 1kHz digit.

When 10 kHz channel step is selected, keys 0, 1, 2, 3, 4, 5, 6, 7, 8 and 9 are available for entry into the 10kHz digit.

When 12.5 kHz channel step is selected, keys 0, 1, 2, 3, 5, 6, 7 and 8 are available for entry into the 10kHz digit.

When 15 kHz channel step is selected, keys 0, 1, 3, 4, 6, 7 and 9 are available for entry into the 10kHz digit.

When 20 kHz channel step is selected, keys 0, 2, 4, 6, and 8 are available for entry into the 10kHz digit.

When 25 kHz channel step is selected, keys 0, 2, 5 and 7 are available for entry into the 10kHz digit.

4.3 KEYPAD ENTRY

When frequency is selected by key pad direct entry, numbers will appear on the LCD display as they are entered on the key pad.

1. Select the Main Band by pressing the VHF or UHF key.

2. Begin by entering the 100 MHz digit.

3. Enter the 10 MHz digit.

4. Enter the 1 MHz digit.

5. Enter the 100 kHz digit.

6. Enter the 10 kHz digit. If the radio is in 10 kHz or higher step, a beep will sound and the band indicator will stop flashing.

7. Enter the 5 kHz digit if the radio is set for 5 kHz step.

4.4 CLEARING ENTRY

To clear an error during key pad entry, you may:

o Press the VHF or UHF band key, or
o Press the PTT key.

4.5 MONO BAND FUNCTION

If you only want to use one band without distraction from the other band, follow these steps for mono band.

1. Switch off the radio.

2. Press either the VHF or UHF key while powering on the radio.

Restore dual band capability by pressing the inactive band key. If VHF is selected for mono band operation, press the UHF key to restore dual band operation.

5 TRANSMITTING

1. Make sure that you follow all steps set forth in the "GETTING READY" section (Section 4) first.

2. Select a frequency, shift direction, shift value, and PL tone frequency.

3. Check to see if the frequency is in use before transmitting.

4. Select appropriate transmitter output level by the switch located on the rear panel of the radio.

5. Press the PTT switch and speak approximately 5" from the microphone, located on the front of the radio.

5.1 POWER OUTPUT SETTING

There are three power settings on the DJ-580T/E. You may select either High (H), Medium (M) or Low (L) from the PO function on the front panel. Refer to the battery specifications for more on output levels.

Change power output levels by performing the following.

1. Press and hold the FUNC key, then press the PO key repeatedly to obtain the desired output power.

*** WARNING ***

It is possible to cause UHF receive interference while transmitting on VHF. To avoid this from happening, make sure that the VHF frequency x 3 does not equal the frequency on UHF. For example, if VHF transmit frequency is 146.190 the UHF frequency should not be set at 438.570.

5.2 LOW LEVEL BATTERY MODE

This function allows for extended use due to power drop in battery. The FULL indicator will begin to flash when battery drops to approximately 6.2 volts. When you operate your squelch just on the threshold, it will begin to open at approximately 4.75 volts. The sensitivity and transmit power will begin to drop at this time compared to normal operation. The radio will continue to operate until approximately 4.50 volts. At this point in time the battery should be charged.

6 TRANSCEIVER MODES

The DJ-580T/E has 3 modes; VFO mode, Memory mode and Call mode.

6.1 VFO MODE (Variable Frequency Oscillator)

The transceiver will be in VFO mode. This mode is used to change frequency and select the desired channel step, offset frequency (up to 10.995 MHz by 5 kHz), tone frequency (38 frequencies in Hz), Dual Watch, etc.

1. Select the Main Band by pressing the VHF or UHF key.

6.2 MEMORY MODE

The following guidelines will help you to program and manipulate memory channels. In memory mode, memory channels can be reviewed. Other features include Memory Scan, Memory Priority and Dual Watch. To select the memory mode, press the MR key. The memory used last will display:

o Frequency
o Memory channel number
o Other programmed functions

6.2.1 PROGRAMMING A MEMORY CHANNEL (MW KEY)

To write functions to any memory channel, it is necessary to first set those functions in the VFO mode.

o Select VFO mode (VHF or UHF band key).
o Select the receive frequency.
o Select the repeater shift - or + or split
o Select the required offset. Consult your Repeater Directory.
o Select the proper CTCSS subaudible tone "T". Consult your Repeater Directory.
o Select Tone Squelch (Decoder) "T SQL".
o Select Tone Frequency

After selecting and setting the required functions you can write (store) those functions to a memory channel as follows:

1. Select the Main Band by pressing the VHF or UHF key.

2. Select a frequency, shift direction, shift value, CTCSS subaudible tone, Tone squelch and Tone frequency.

3. Press the MR key. A two-digit memory channel number will be displayed on the LCD. If these digits are flashing, it means that this channel number has no information stored.

4. Rotate the Main Tuning Dial clockwise to choose the desired memory channel number (clockwise to increase, counter clockwise to decrease). Select the desired memory channel number (0 to 19).

5. Press and hold the FUNC key along with the MW key to write (store) frequency to memory.

6. Press the MR key to exit.

An alternate method for programming the memory channel is provided as follows:

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the MR key. A two-digit memory channel number will be displayed on the LCD. If these digits are flashing, it means that this channel number has no information stored.

3. Turn the Main Tuning Dial clockwise to choose the desired memory channel number (clockwise to increase, counter clockwise to decrease). Select the desired memory channel number (0 to 19).

4. Select a frequency, shift direction, shift value, CTCSS subaudible tone, Tone squelch and Tone frequency.

5. Press and hold the FUNC key along with the MW key to write (store) to memory.

6. Press the MR key to exit.

6.2.2 SCROLL MEMORY

Scrolling the VHF or UHF bank of memory channels up or down can be accomplished 1 of 2 ways.

MR KEY

1. Press the MR key to put the Main Band into Memory Channel mode. The memory channel number (0-19) will appear. A flashing channel number indicates that no information has been programmed into this memory channel. Turn the Main Tuning dial to increment and decrement the memory channel or use the UP ARROW/DOWN ARROW keys.

2. Press the MR key to exit MEMORY MODE and return to VFO MODE. The two digit memory channel will disappear from the LCD display showing that you have returned to VFO MODE.

You can scan the memory channels with the SCN key, elect to skip any memory channel with the SKIP key, or select the scan type with the TMS key. Refer to the section SCANNING FUNCTIONS (Section 8) for more information.

The DJ-580T/E has two (02) banks of memory channels:

First, the VHF bank has 20 memory channels that are accessed with the MR key.

Secondly, the UHF bank has 20 memory channels that are accessed with the MR key.

6.2.3 CANCELING A MEMORY CHANNEL

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the MR key.

3. Rotate the Main Tuning Dial to choose the desired memory channel number (clockwise to increase, counter clockwise to decrease). Select a non-flashing memory channel number (0 to 19).

4. Press and hold the FUNC key, then press the MW key to cancel this memory channel. The two digit memory channel number will now begin to flash indicating that the content of this memory channel has been cleared.

6.2.4 ALLOCATION OF MEMORY CHANNELS

Using this feature will allow you to free up memory channels from either band and allocate to the other band for frequency storage.

EXAMPLE: FREE MEMORY CHANNELS

Lets say you wish that you had 25 programmable VHF memory channels but the radio comes defaulted to 20. No problem, that's why this feature has been included. Since the radio has 40 channels in total, 20 for each VFO, it is possible to allocate all 40 channels to one band for memory programming. This scenario would leave the other band with no programmable memory channels. Here is how to make it all happen.

1. Press and hold the FUNC key, then press the * key. The symbol FL will appear on the LCD display.

2. Press and hold the FUNC key, then press the 1 key. The number of allocated memory channels for each VFO will appear on each band display.

When the Main Tuning Dial is rotated clockwise, the number of possible VHF memory channels will increase. This number will increase while the allocated memory channels from the UHF side will decrease.

When the Main Tuning Dial is rotated counter clockwise, the number of possible UHF memory channels will increase. This number will increase while the allocated memory channels from the VHF side will decrease.

3. Press and hold the FUNC key, then press the * key four (4) times to clear FL/PL from the display and exit beep tone level mode.

6.2.5 MEMORY TO VFO COPY FUNCTION

This function is used to copy details of a memory or call channel into a VFO.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the MR key.

3. Select a memory channel number by rotating the Main Tuning dial.

4. Press and hold the FUNC key, then press the C key. The information from the memory channel has been copied to the VFO, currently displayed.

6.3 CALL MODE

The CALL mode allows a single key to use an immediately desired programmed frequency. Each band has one Call Channel which can be accessed by pressing the CALL key. A preferred local repeater is usually programmed into the Call Channel. The indicator C appears on the LCD when Call Priority and/or Dual Watch function is active.

6.3.1 PROGRAMMING THE CALL CHANNEL (W KEY)

To write functions to a CALL Channel, it is necessary to first set those functions in the VFO mode.

o Select VFO mode (VHF or UHF band).
o Select the receive frequency.
o Select the repeater shift - or +
o Select the required offset. Consult your Repeater Directory.
o Select the proper CTCSS subaudible tone "T". Consult your Repeater Directory.
o Select Tone Squelch (Decoder) "T SQL".
o Select Tone Frequency

After selecting and setting the required functions you can write (store) those functions into a CALL Channel as follows:

1. Select the Main Band by pressing the VHF or UHF key.

2. Select a frequency, shift direction, shift value, CTCSS subaudible tone, Tone squelch and Tone frequency.

3. Press and hold the FUNC key, then press the CALL key. The frequency selected in step 2 will be stored into the CALL channel. The C indicator appears on the LCD showing you that your current mode is CALL channel mode.

4. Press the CALL key again to return to previous mode and frequency.

6.3.2 ACTIVATING CALL CHANNEL

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the CALL key. The CALL indicator C will appear on the LCD display.

3. Press the CALL key again to return to previous mode and frequency.

6.3.3 CALL CHANNEL TO VFO COPY FUNCTION

This function is used to copy details of a memory or call channel into a VFO.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press the CALL key.

3. Press and hold the FUNC key, then press the C key. The information from the call channel has been copied to the VFO, currently displayed.

7 PRIORITY FUNCTIONS

The following priority functions are available:

o VFO Priority
o Memory Priority
o Call Priority (Dual Watch)

7.1 VFO PRIORITY

In this mode a VFO frequency is received for 4 seconds and a Memory frequency is received for 1/2 a second. This cycle will repeat continuously. Here is how it works:

1. Select the Main Band by pressing the VHF or UHF key.

2. Select and enter a frequency.

3. Press the MR key to activate Memory mode. If the memory channel is blinking, it hasn't been programmed.

4. Rotate the Main Tuning Dial to a desired Memory Channel that has been programmed. You may also use the UP ARROW or DOWN ARROW key to change memory channels.

5. Return to the Main Band VFO as you selected in step 1.

6. Press the PRI key to begin priority function. The LCD will display PRI.

7. Press the PRI key to stop the priority function. The LCD will remove the flashing PRI from the display.

*** NOTE ***

When a signal is received on the memory channel a BEEP will be emitted once from the speaker.

In VFO priority, the transmitter may be activated on either frequency. Press the PTT switch when the desired frequency is displayed on the LCD.

7.2 MEMORY PRIORITY

In this mode a Memory frequency is received for 5 seconds and a VFO frequency is received for 2 second in a continuous cycle. Here is how it works:

1. Select the Main Band by pressing the VHF or UHF key.

2. Select and enter a frequency.

3. Press the MR key to activate Memory mode. If the memory channel is blinking, it hasn't been programmed.

4. Rotate the Main Tuning Dial to a desired Memory Channel that has been programmed. You may also use the up or DOWN ARROW to change memory channels.

5. Press the PRI key to begin priority function. The LCD will display PRI.

6. Press the PRI key to stop the priority function. The LCD will remove PRI from the display.

*** NOTE ***

When a signal is received on the VFO frequency a BEEP will be emitted once from the speaker.

In memory priority, the transmitter may be activated on either frequency. Press the PTT switch when the desired frequency is displayed on the LCD.

7.3 CALL PRIORITY

The VFO frequency or Memory channel is scanned for approximately 1/2 second and the programmed CALL frequency is scanned for approximately 4 seconds.

1. Select the Main Band by pressing the VHF or UHF key.

2. If the CALL channel hasn't been programmed yet, refer to section 6.3.1 for more information.

3. Enter a frequency into the VFO or select a Memory channel in memory channel mode.

4. Press the CALL key for approximately 1/2 second. Call priority will begin to cycle between the CALL channel and the selected VFO or memory channel.

5. Press the PRI key to begin priority function. The LCD will display PRI.

6. Press the PRI key to stop the priority function. The LCD will remove PRI from the display.

*** NOTE ***

When a signal is received on the VFO frequency a BEEP will be emitted once from the speaker.

In CALL priority, the transmitter may be activated on either frequency. Press the PTT switch when the desired frequency is displayed on the LCD.

7.4 DUAL WATCH FUNCTION

Unlike priority, there is no period for listening between two modes. Dual Watch is a constant monitoring of two modes.

7.4.1 VFO/MEMORY DUAL WATCH

Perform the following for VFO/MEMORY DUAL WATCH.

1. Select the Main Band by pressing the VHF or UHF key. Enter a desired frequency.

2. Press the MR key and select the desired memory channel.

3. Return to the VFO mode as selected in step #1.

4. Press and hold the FUNC key, then press the DUAL key. The radio will begin with the VFO frequency followed by the memory channel frequency. The cycling between these frequencies is approximately .5 second.

5. Press the VFO button as selected in step #1 to stop DUAL WATCH.

*** OPERATING HINT ***

Without stopping DUAL WATCH operation, you can enter a new frequency into the selected VFO and DUAL WATCH will continue automatically. Enter the new VFO frequency via the key pad. DUAL WATCH operation will be suspended while you are entering the new VFO frequency, but will resume operation after you have completed entry.

7.4.2 CALL/VFO DUAL WATCH

Unlike priority, there is no time period for listening between two modes. Dual Watch is a constant monitoring of two modes. Perform the following for CALL/VFO DUAL WATCH.

1. Select the Main Band by pressing the VHF or UHF key. Enter a desired frequency.

2. Press the CALL key. The CALL channel must be programmed.

3. Press and hold the FUNC key, then press the DUAL key. The radio will begin with the CALL frequency followed by the VFO frequency. The cycling between these frequencies is approximately .5 second.

4. Press the Main Band key as performed in step 1 to stop DUAL WATCH.

7.4.3 CALL/MEMORY DUAL WATCH

Unlike priority, there is no time period for listening between two modes. Dual Watch is a constant monitoring of

two modes. Perform the following for CALL/MEMORY DUAL WATCH.

1. Press the MR key and select the desired memory channel.

2. Press the CALL key. The CALL channel must be programmed.

3. Press and hold the FUNC key, then press the DUAL key. The radio will begin with the CALL frequency followed by the memory channel frequency. The cycling between these frequencies is approximately .5 second.

4. Press the VFO button as selected in step #1 to stop DUAL WATCH.

8 SCANNING FUNCTIONS

The DJ-580T/E offers various scanning options and 3 scanning modes described a little later on in this section. First lets look at the scanning options, they are:

VFO Scan - Scans either band independently.

Program Band Scan (VFO Mode) - Scans programmed lower to upper frequencies. You may scan a range of frequencies.

Memory Scan - Each band may scan memory channels independently.

| Whether you are scanning (SCN) or manually tuning, when;

| o Passing a 500kHz boundry a single beep will be heard | through the speaker.

| o Incrementing frequencies past a 1MHz boundry, a low beep | followed by a high beep will be heard.

| o Decrementing frequencies past a 1MHz boundry, a high

8.1 VFO SCAN

Each band may scan VFO channels independently. When in Band Scan mode the DJ-580T/E scans by Channel step, by 100 kHz or by 1 MHz steps. As the scan passes through any 500 kHz or 1 MHz point a tone will sound if the BEEP function is active.

1. Select the Main Band by pressing the VHF or UHF key twice. The purpose for pressing the band key twice is in the event you are in memory mode by mistake.

| 2. Press the SCN key for approximately 1 second, a beep | will be heard. Release the SCN key. Use the Main Tuning dial or UP ARROW or DOWN ARROW keys to scan in a particular direction.

3. Whether you are cycling upward or downward, during scan the decimal point will flash indicating that scanning has begun.

4. When a signal is received, scanning will stop and remain on that frequency. When channel goes quiet or Main Tuning Dial is rotated clockwise or counter clockwise, scanning will continue.

| 5. To cancel scanning press the SCN key. A beep will not be
| heard when initially pressed, but will be heard when the
| SCN key is released.

All 3 scan types can be applied to Band Scan.

8.1.1 PROGRAM BAND SCAN MODE (VFO MODE)

This scan option allows the scanning of a range of VFO
frequencies. Each band may have independent scan ranges.
| The lower band limit is programmed into Memory Channel P1. The
| upper band limit is programmed into Memory Channel P2. You may
initiate Program Band Scan from either VFO or Memory mode.

EXAMPLE: STORING LOWER/UPPER RANGES

1. Select the Main Band by pressing the VHF or UHF key, for
example VHF.

2. Enter a desired Lower Frequency via the key pad, for
example "146.000".

3. Press the MR key.

4. Rotate the Main Tuning Dial until P1 is displayed.

5. Press and hold the FUNC key, then press the MW key to
store the selected Lower Frequency into memory.

6. Enter a desired Upper Frequency via the key pad like
146.100.

7. Press the MR key.

8. Rotate the Main Tuning Dial until P2 is displayed.

9. Press and hold the FUNC key, then press the MW key to
store the selected Upper Frequency into memory.

10. Press and hold the FUNC key, then press the SCN key.
The letter P will begin to blink on the display.
Scanning from 146.000 to 146.100 has begun.

11. Press the Main Band key as performed in step 1 to
stop this function. Pressing the SCN key will also
cease this function.

*** NOTE ***

The upper limit frequency and Lower limit frequency may be
stored into either P1 or P2.

8.2 MEMORY SCAN MODE

This scan option allows the user to scan frequencies that
have been programmed in any (or all) of the memory
channels. Bands may be scanned individually or both bands

may be scanned simultaneously.

1. Select the Main Band by pressing the VHF or UHF key twice. The purpose for pressing the band key twice is in the event you are in memory mode by mistake.

2. Press the MR key.

| 3. Press the SCN key for approximately 1 second, a beep | will be heard. Release the SCN key. Use the Main Tuning dial or UP ARROW or DOWN ARROW keys to scan in a particular direction.

4. Whether you are cycling upward or downward, during scan the decimal point will flash indicating that scanning has begun.

5. When a signal is received, scanning will stop and remain on that frequency. When channel goes quiet or Main Tuning dial is rotated clockwise or counter clockwise, scanning will continue.

| 6. Press the Main Band as performed in step 1 to stop this function. To cancel scanning press the SCN key. A beep will not be heard when initially pressed, but will be heard when the SCN key is released.

8.2.1 MEMORY CHANNEL SKIP MODE

Memory Channel Skip permits unwanted memory channels to be skipped during memory scan. This step presumes that you have already programmed some/all memory channels.

1. Press the MR key.

2. Rotate the Main Tuning Dial until the memory channel that you want to skip is displayed.

3. Press the SKIP key. The decimal point will disappear from the frequency displayed, indicating this frequency will be skipped. Perform step 2 and 3 for each memory channel that you wish to skip.

4. To cancel Memory Channel Skip, press the SKIP key again. The decimal point will re-appear, and that memory channel will now be restored to scan status.

8.3 SCANNING TYPES

The DJ-580T/E offers 3 different scanning modes as shown below. The initial factory setting is the Busy Channel Scan.

Busy Scan - Stops at a busy channel or frequency until clear. Two seconds after the signal ceases, scanning

resumes.

Timed Scan - Stops at busy channel or frequency, then
resumes scan 5 seconds later even if the
channel remains busy. Scanning will also
resume when a signal received ceases.

Selecting a Scan Type:

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the TMS key. A
black block with a white lettered T will appear,
indicating to you that "Timed Scan" has been selected.

3. Press and hold the FUNC key, then press the TMS key
again to leave "Timed Scan". The black block with a
white lettered T will disappear from the LCD display.

The DJ-580 will be in "Busy Scan" when not in "Timed Scan".

8.4 OTHER SCANNING INFORMATION

This subsection talks about all other information pertinent
to radio scan.

8.4.1 DUAL BAND SCAN

You may want to scan both bands at the same time. You can
perform that function by following this example.

EXAMPLE: DUAL BAND SCAN

1. Press the VHF key.

2. Press the UP ARROW key for approx. 1 second.

3. Press the UHF key.

4. Press the UP ARROW key for approx. 1 second.

8.4.2 DUAL BAND SCANNING WITH MEMORY PRIORITY

If you want to activate PRIORITY on both bands while SCANNING,
no problem, follow this example.

EXAMPLE: DUAL BAND SCAN WITH DUAL BAND PRIORITY

1. Press the VHF key.

2. Press the MR key and rotate Main Tuning dial for a
desired memory channel.

3. Press the VHF key.

4. Press the SCN key for approx. 1 second.

5. Press the PRI key.

6. Press the UHF key.

7. Press the MR key and rotate Main Tuning dial for a desired memory channel.

8. Press the UHF key.

9. Press the SCN key for approx. 1 second.

10. Press the PRI key.

9 REPEATER OPERATIONS

Amateur radio repeaters utilize separate transmitter and receiver sections. The transmitter frequency may be offset either above or below the receive frequency according to repeater coordination conventions.

9.1 SPLIT FREQUENCY FUNCTION

When standard offsets will not satisfy an input or output frequency, a split is utilized for this purpose. Split can be configured on the DJ-580 for VFO and MEMORY modes. The split frequency function will not operate in CALL mode.

9.1.1 VFO MODE SPLIT

Perform the following for VFO MODE SPLIT.

1. Select the Main Band (VFO) by pressing the VHF or UHF key. Enter a frequency into the VFO for your output (receive) frequency.

2. Press the MR key. Program or select a frequency in any MEMORY channel for your input (transmit) frequency.

| 3. Enter VFO as selcted in step 1. VFO frequency is used
| for receive and the MEMORY channel is used for transmit.

4. Press and hold the FUNC key, then press the SHIFT key
| repeatedly until the star symbol appears on the display.
The split setup is now complete.

9.1.2 MEMORY MODE SPLIT

Perform the following for MEMORY MODE SPLIT.

1. Press the MR key. Program or select a frequency in any MEMORY channel for your input (transmit) frequency.

2. Select the Main Band (VFO) by pressing the VHF or UHF key. Enter a frequency into a VFO for your output (receive) frequency.

| 3. Press the MR key again. MR frequency is used for receive
| and the VFO frequency is used for transmit.

4. Press and hold the FUNC key, then press the SHIFT key
| repeatedly until the star symbol appears on the display.
The split setup is now complete.

9.2 REV KEY

In some areas there may be repeaters operating on repeater frequency pairs, the exact reverse of another repeater in the area. That is, the input of one repeater is the output frequency of the other and vice versa. To avoid the inconvenience of reprogramming every time both repeaters are in range, the REV key allows instant reversal of the input and output frequencies and the offset direction. The REV function is also useful to check the repeater input to determine if another station is heard directly so you can go simplex. To activate the REV function:

1. Press and hold the FUNC key, then press the REV key. The repeater input frequency and opposite SHIFT indicator will appear on the LCD display panel.

2. Press and hold the FUNC key, then press the REV key again to cancel the REV function.

9.3 RESETTING RADIO

*** NOTE ***

Resetting the radio will erase all user programmed information (frequencies,shifts,offsets etc.) Make sure that this information has been written down before proceeding.

1. Make sure radio is powered off.

2. Press and hold the FUNC key in while turning on the radio via the power knob. The LCD will display 145.00 (VHF) and 445.00 (UHF).

*** NOTE ***

If you were to hold the FUNC key in and not let it go while powering up the radio, all display segments will be shown.

9.4 CTCSS ENCODE/DECODE

CTCSS encoding allows you to select the proper tone frequency to open another operators radio receiver or repeater. CTCSS decoding enables another operator to select the tone your receiver requires enabling you to hear them. Unlike Code Squelch operation (Refer to section 11 for details), a specific tone frequency is used. Here's how to use CTCSS Encoding/Decoding.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the TONE key.

3. Rotate the Main Tuning dial to the desired tone.

4. When the tone has been selected enter the Main Band by pressing either the VHF or UHF key.

5. Press and hold the FUNC key, press the T.SQL key repeatedly. Tone settings will cycle each time the T.SQL key is pressed. It cycles as follows on the LCD display:

o The Tone Encoder is Enabled when the letter T is displayed on LCD.

o The Tone Decoder Squelch function is enabled when the letter T and SQL is displayed on the LCD. When this function is active, you would expect a particular tone to open your radio receiver.

o When the T and SQL is not displayed, the encoder/decoder is disabled.

EXAMPLE: TONE ENCODER/DECODER

Radio for Joe Radio for Linda
------------ ---------------
Tone set: 100.0 Tone set: 100.0
T displayed (ENCODE) T and SQL displayed (DECODE)

A) Radio operator "Joe" is calling "Linda". The interesting point here is that when the radio that Linda is using displays T and SQL, nothing will be heard through her radio speaker when squelch is opened up (fully counter clockwise). You will notice however that the S/RF indicator will be shown on the LCD when squelch is opened.

B) The only way that Linda will hear Joe is for Joe to send the proper tone to open Linda's radio receiver. If Joe doesn't send the right tone, Linda's radio will remain silent.

10 AUTOPATCH OPERATION (AUTOMATIC DIALER)

The DJ-580T/E offers three automatic dialer memories. A telephone number may be entered in either the VHF or the UHF frequency mode. The stored telephone number is transmitted on whichever band is selected as the Main Band.

10.1 PROGRAM AUTODIAL NUMBER

To enter a telephone number, perform the following:

1. Press and hold the FUNC key, then press the A key. The selected VFO frequency display will clear and display C1 or C2 or C3. Rotate the Main Tuning dial clockwise or counter-clockwise to obtain a desired dialer memory. The telephone symbol will display on the LCD and flash, indicating that the dialer memory is ready to accept the number to be stored. You may enter up to 16 numbers, letters and symbols, four at a time in four groups.

2. The telephone number or codes should be entered in order from the beginning. The following characters can be used:
0-9, A-D, *, #

3. Press and hold the FUNC key, then press the A key to store the entered telephone number or codes. The telephone symbol stops flashing and is on steady to show that this function is active.

Proceed to Section 10, 10.4 to transmit the dial sequence. Clear out dialer memory to enter a new sequence.

10.2 CLEAR DIALER MEMORY

1. Press and hold the FUNC key, then press the A key.

2. Rotate the Main Tuning dial to the dialer memory you wish to clear.

3. Press and hold the FUNC key, then press the C key followed by the A once again.

10.3 CORRECTING CODES IN DIALER MEMORY

1. Press and hold the FUNC key, then press the A key.

2. Rotate the Main Tuning dial to the dialer memory you wish to make a correction in.

3. Press and hold the FUNC key, then rotate the Main Tuning dial until the sequence of digits you wish to correct have just exited the display.

EXAMPLE: CORRECTING DIALER CODES

Programmed number is 123567890, but you forgot 4!

1. Press and hold the FUNC key, then press the A key.

2. Rotate the Main Tuning dial to the dialer memory you wish to make a correction in.

3. Press and hold the FUNC key, then rotate the Main Tuning until the numeral 3 is displayed.

This represents the last digit displayed on the LCD.
| These digits are hidden just right of last digit shown.
v vvvvvv
123 567890

4. Now enter 4567890. After you play with this for awhile
you will see how it works.

10.4 TRANSMIT/CHANGE AUTODIAL NUMBER

After performing the steps in section 10.1, perform the
following steps to transmit the programmed number.

1. Press and hold the FUNC key, then press the "A" key.

2. The telephone symbol could be blinking which represents
an unprogrammed dialer memory channel. Refer to Section
10. Otherwise, rotate the main tuning knob to the
desired dialer memory channel.

Verify that the blinking telephone symbol appears on the
LCD display.

3. Press the PTT switch for an instant. This will return
you to VFO mode.

4. To transmit dialer memory channel, Press and hold the
PTT key.

** LOOK AT LCD DISPLAY **

You are now transmitting. The ON AIR symbol should
display on the LCD display.

5. While transmitting press the FUNC key to send/transmit
the autodial sequence.

** LISTEN **

The dialer sequence that you programmed earlier will be
transmitted. You can hear the tones that are being sent
through the DJ-580 speaker.

HIDDEN FUNCTIONALITY

This is where you will have to experiment a bit. You can
change the dialer sequence timing. Refer to Section 10.7
for all of these new details.

10.5 MANUAL DIAL

In some instances you may want to dial a number manually.
perform the following steps.

1. The telephone symbol should not appear on your display.
If it does, press and hold the FUNC key, then press the
A key, the C key and finally the A key again.

2. Press and hold the PTT key.

3. Now dial the number on your keypad as you would a
telephone.

10.6 DISABLE AUTODIAL

Performing the following step will erase a stored
number in the autodialer.

1. Press and hold the FUNC key, then press the A key, the C
key and finally the A key again.

You can either clear the dialer channel or not press the
FUNC key during a transmission.

10.7 DIALER RATE ADJUST

The following steps are used for changing the
dialer and dsq tone rates. This function may not
appear/be available on earlier DJ-580 units.

1. Press the * key. The symbol FL will appear on the LCD
display.

2. Press the following keys in sequence: #, 1, 2, 3. The
LCD will display the letter C. If you repeat this step
continiously the letters will change as follows:
C,D,upside down A,H,0,1,2,3,4,5,6,7,8,9,A,B

| Each of these indicators are associated with a different
| rate during transmission. The fastest begins at 1 and the
| slowest is zero. The letters are variations of slow rates.

11 DIGITAL SQUELCH (DSQ)

DSQ stands for DTMF Squelch Control. DSQ is very versatile
and will allow you to:

o Make a transmission that will specifically be heard by a
particular group (of your choosing, by a code sequence).
o Place a private call to a selected person in a group.
o Call a single operator.
o Straight DSQ transmission

This feature is achieved by use of DTMF Tones that will either open
(or keep closed) the DJ-580T/E. In this section you will learn how
to transmit and receive the DSQ SCHEME! A radio must be DSQ
compatible to take advantage of these features.

11.1 DSQ SCHEME

Before we get started let's look at the DSQ tone structure.
Depending on the transmission type (Group, Private etc.), a
particular tone sequence will be sent. The tone structure
is broken down into the following areas:

o GROUP Code - 3 digit sequence
o OTHER'S Code - 3 digit sequence
o OWN Code - 3 digit sequence
o MISC Codes

The following explanation of each area will help you to fully understand how each is utilized.

3 DIGIT "GROUP" CODE

By programming a 3 digit group code your members of a group would receive a common transmission. Perhaps this group wouldn't want to hear a transmission meant for another group that has another 3 digit code sequence.

EXAMPLE: GROUP CODE

Lets say that you are helping the local police department find a missing child. They have split 10 radio operators into 2-five person teams. Let's call them team 1 and team 2.

Each member of team 1 has a radio with a group code of 111. Each member of team 2 has a radio with a group code of 222.

The police have just found evidence that the child is definitely located in team 2 territory. The central transmission point now needs to contact the members of team 1 and notify them that their search area must be changed. They will send out a 111 group code (tone sequence) to team 1. By virtue of the group code 111, all members of team 1 will hear the message and team 2 will hear nothing on their radios. A separate transmission to group 2 could be placed with specific updated information!

3 DIGIT "OTHER'S" CODE

This code is used as an identifier of another station. In other words, it is the other persons "own" code.

EXAMPLE: OTHERS CODE

Lets say that an individual in team 1 needs to be given some specific information. The receiving stations identifier is referred to as the other's code. We will send that person the information by virtue of their 3 digit "own" code. You must enter their "own" code into your "others" code field.

3 DIGIT "OWN" CODE

A transmitting station uses 3 digits as a personal identification number. A receiving station uses this code to identify who called them.

EXAMPLE: OWN CODE

Lets say that you will receive some specific information. The other person will need to know your "own" code before your radio will receive a private call. Your "own" code is also necessary, because the other person receiving your message will see your "own" code displayed on their radio LCD.

MISC CODES

16 numbers, letters and symbols can be used for coding. Here's what you can use; 0-9, A-D, * and #. An "H" will appear on the LCD when the * is entered and upside down A will appear when the # is entered. The # sign is used as a wild card. Refer to WILDCARD for more information.

11.2 PROGRAMMING ALL DSQ CODES

Place your radio in front of you. The following steps get your radio set for DSQ operation.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the B key. The LCD display will indicate A-000.

3. Enter 3 digits for the group that YOU want to call. In other words, a unique calling code for a specific group.

EXAMPLE: PROGRAM 1ST GROUP CODE

A-123

4. Rotate the Main Tuning dial clockwise until B-000 is displayed on the LCD.

5. Enter 3 digits for another group that YOU might call. This is an additional group calling code.

EXAMPLE: PROGRAM 2ND GROUP CODE

B-456

6. Rotate the Main Tuning dial clockwise until P-000 is displayed on the LCD.

7. Enter 3 digits for your "own" Personal code. This is your unique identification code.

EXAMPLE: PROGRAM YOUR OWN CODE

P-100

8. Rotate the Main Tuning dial clockwise until y-000 is displayed on the LCD.

9. And now you must select the "others" 3 digit code. This is the operator you're calling. Lets say you're calling

operator 200, enter "200" on the keypad.

EXAMPLE: PROGRAM THE OTHERS CODE

y-200

10. Rotate the Main Tuning dial clockwise until nn-00 is displayed on the LCD.

11. Enter a two digit code that will become the Digital Signal Message.

EXAMPLE: DIGITAL SIGNAL MESSAGE

nn-07

12. Press the VHF or UHF key to end setup.

Only radios with DSQ functionality are capable of receiving and/or transmitting DSQ tasks. These tasks are described in the following sub-sections, have fun!

11.3 DSQ MODES

This section will address all functions of DSQ and describe how they should be used. Only through experimentation of DSQ will you get the hang of it. DSQ functionality comes in various flavors, and they are shown in the following table.

DSQ FUNCTION	LCD DISPLAY
Straight DSQ	D.SQ
Group Calling	G D.SQ
Private Calling In A Group	G P D.SQ
Private Call	P D.SQ

11.3.1 TRANSMITTING (CODE SQUELCH)

Coded Squelch is a unique 3 digit sequence, when sent to another unit configured only for D.SQ, will open the receiver for reception. It's always a good idea to have a cheat card that lists each units identifier (own code) and group codes.

1. Select the Main Band by pressing the VHF or UHF key.

2. Press and hold the FUNC key, then press the B key.

3. Rotate the Main Tuning dial and select either A- for GROUP A or B- for GROUP B. Each group should have a unique identifier code. If either GROUP A or B doesn't contain the desired 3 digit code, enter it in at this time via the keypad.

4. Return to the Main Band as selected in step 1.

5. Press the B key several times until "D.SQ" displays on the upper right-hand corner of the LCD.

6. When you press the PTT key, the Code Squelch is transmitted automatically. At the conclusion of the 3 digits being transmitted, the operators radio (who you are calling) receiver will accept your transmission.

11.3.2 RECEIVING (CODE SQUELCH)

If the received Code Squelch signal matches the set Code Squelch code, D.SQ will begin to flash on the LCD display. In addition, an audible alert will be heard through the speaker.

If the receiver is on receive mode by code squelch, it is possible to communicate within 1.5 seconds after a received signal is clipped.

11.3.3 TRANSMITTING (GROUP CALLING)

When you select this option, you will be able to contact many operators that collectively make up a group. If operators with compatible DSQ functionality are configured correctly, and all have the same group code programmed, their radios should open and receive your call. It's always a good idea to have a cheat card that lists each units identifier (own code) and group codes. Here's what you have to do.

1. Press the B key.

2. Rotate the Main Tuning dial and select either A- for GROUP A or B- for GROUP B. Each group should have a unique identifier code.

3. Press the B key several times until G D.SQ displays on the upper right-hand corner of the LCD.

4. When you press the PTT switch, the GROUP code selected will be transmitted to all units in the GROUP.

If you are using GROUP A in step 2 and wish to change to GROUP B, follow steps 1-4 again.

The following DSQ code is transmitted as shown:

(3 DIGIT GROUP CODE) * (3 DIGIT OWN CODE)

11.3.4 RECEIVING (GROUP CALLING)

To receive DSQ coded calls in GROUP CALLING, setup your radio for G DSQ as follows:

1. Press and hold the FUNC key, then press the B key until G DSQ appears on the LCD display.

When the received DSQ code matches the first 3 digits of your display (group code), the G DSQ indicator will begin to flash. If the BEEP is off, the squelch will open for as long as the calling operator is transmitting. If the BEEP is on, an audible beep will be emitted from the radio and the indicator will display which group is calling. Reset the display by pressing the Main Band key or PTT.

11.3.5 TRANSMITTING (PRIVATE CALLING IN A GROUP)

It's always a good idea to have a cheat card that lists each units identifier (own code) and group codes.

1. Press the B key.

2. Rotate the Main Tuning dial and select either A- for GROUP A or B- for GROUP B. Each group should have a unique identifier code.

3. Press the B key several times until GPDSQ displays on the upper right-hand corner of the LCD.

4. Press the PTT switch to transmit the DSQ code or press the VFO key for the band you are working.

The following DSQ code is transmitted as shown:

(3 DIGIT GROUP CODE) (1 DIGIT OTHERS CODE) * (1 DIGIT OWN CODE)

11.3.6 RECEIVING (PRIVATE CALLING IN A GROUP)

To receive DSQ coded calls in PRIVATE CALL IN A GROUP, setup your radio for GPDSQ as follows:

1. Press and hold the FUNC key, then press the B key until GPD.SQ appears on the LCD display.

When the received DSQ code matches the first 3 digits of your group and your own code, the DSQ GP indicator will begin to flash. If the BEEP is off, the squelch will open for as long as the calling operator is transmitting. If the BEEP is on, an audible beep will be emitted from the radio and the indicator will display which group is calling. Reset the display by pressing the Main Band key or PTT.

11.3.7 TRANSMITTING (PRIVATE CALL)

This option would be used when someone is calling only you. This is different from encode/decode because you determine your own identification code and not a subaudible tone. It's always a good idea to have a cheat card that lists each units identifier (own code) and group codes.

1. Press the B key.

2. Press the B key several times until P D.SQ displays on the upper right-hand corner of the LCD.

3. Press the PTT key to transmit the DSQ code or press the VFO key for the band you are working.

The following DSQ code is transmitted as shown:

(3 DIGIT OTHERS CODE) * (3 DIGIT OWN CODE)

11.3.8 RECEIVING (PRIVATE CALL)

To receive DSQ coded calls in PRIVATE CALL, setup your radio for P D.SQ as follows:

1. Press and hold the FUNC key, then press the B key until P D.SQ appears on the LCD display.

11.4 ERROR CODE

When the "Other's" private code is not confirmed the LCD display will indicate "Er".

11.5 TIMING CONSIDERATIONS

On occasions you may find that the operation of DSQ through some older repeaters may be unpredictable. This occurs on initial transmit with your DJ-580. When you transmit, a time delay occurs before the repeater is fully transmitting. The DJ-580 will begin to transmit the DSQ tone sequence during the repeater transmit delay. The DJ-580 can delay 450 ms or 750 ms. In addition, the timing period for the tone burst sequence can be adjusted. Please refer to section 10.7 for more information.

It is possible to delay the time to transmit codes to about 750ms after the PTT key is pressed.

1. Press and hold the FUNC key, then press the * key. The LCD display will display FL.

2. Press and hold the FUNC key, then press the 4 key. The LCD display will display d-750 or d-450. Repeat this step until the desired selection is made.

3. Press and hold the FUNC key, then press the * key. Repeat this step until FL and PL is absent from the display.

11.6 DSQ WILDCARDS

The # symbol is a wildcard that may be substituted for any one digit,letter or symbols used in DSQ codes. When the # symbol is entered it appears on the LCD display as an upside down A. The wildcard allows for the combination of many groups. If the first or first and second digits of

several group codes are the same, you can replace the second and third digits (or just third digit) with a # mark, and thus transmit to all those groups.

EXAMPLE: WILDCARDS

1. Enter the 2 meter frequency of 146.520.

2. Press and hold the FUNC key, then press the DSQS key. Select any code squelch memory channel.

3. Release the FUNC key now and select a 3 digit code squelch code using the keypad.

Example: Enter the 3 digit code 1#5.

4. Press the FUNC key to return the LCD display to operating frequency.

Example: Now you will see on the LCD display P45.52.

5. Press the D.SQL key repeatedly (2 times) until C appears in the 100 MHz digit location.

Example: C45.620

If the incoming coded calls are anyone with a group code as follows, the call will be received by your radio.

o 105 through 195
o 1A5 through 1D5
o 1*5
o 1#5

6. When you receive a call from another station, the C will flash on and off for as long as the other operator is transmitting. Your radio has already memorized who was calling you, so press the PTT switch and you will transmit to that station directly. When you have completed your QSO, enter the wildcard sequence again to open your radio to all other stations again.

11.7 DIGITAL SIGNAL MESSAGE

This function allows you to send or receive messages consisting of 2 digit codes.

11.7.1 TRANSMITTING DIGITAL SIGNAL MESSAGE

You can retain 1 signal message in the transmitter memory.

1. Press and hold the FUNC key, then press the B key.

2. Rotate the Main Tuning dial and select a message memory channel nn.

3. Enter a 2 digit message code. This is a code that has been predetermined and understood by the operating parties.

4. Press the VHF or UHF key to end setup.

5. Set the appropriate paging function (D.SQ, G D.SQ etc).

6. Press the PTT key to transmit the DSQ code. Continue to hold the PTT key and press the CALL key.

What the receiving operator will see on the display will be the unit number f the calling station followed by the 2 digit code. The following is the sequence sent:

(2 DIGIT SIGNAL MESSAGE)

11.7.2 RECEIVING DIGITAL SIGNAL MESSAGE

1. Set the appropriate paging function (D.SQ, G D.SQ etc).

2. When the appropriate codes are received, your receiver will open to hear the calling operator. When the digital signal message is sent shortly after the initial transmission, you will see on the LCD display the 3 digit calling station followed by a - and then the 2 digit digital signal message.

11.7.3 TRANSMITTING WITH DIGITAL SIGNAL DISPLAYED

While a digital signal message is displayed, press the PTT switch. Your signal will be transmitted back to the station calling by using the displayed DSQ settings. The frequency will return to your LCD display.

11.7.4 REVIEW DIGITAL SIGNAL MESSAGE MEMORY

You can store up to 3 previously received digital signal messages. The first two memories store the messages in received order. The third memory stores the latest message. These messages display the 3 digit calling station followed by the 2 digit message. Here's how to view digital signal message memory.

1. Press and hold the FUNC key, then press the MESS key. Select any code squelch memory channel. The latest message will be displayed on the LCD display.

2. Rotate the Main Tuning dial to review the previously sent messages in n1 through n2. You can also use the arrow keys to review these messages.

11.7.5 CLEARING MESSAGE MEMORY

If you find it necessary to clear out messages, proceed with the following steps.

1. Select the memory number and press the C key once to clear out that location.

12 CROSS BAND REPEATER

The DJ-580 is capable of cross band repeat. To simplify matters, it means that when you transmit on one band it is simultaneously heard on the other band. Ok you want to set up a cross band repeater? Here are a few things to remember about cross band repeat:

1. When cross band repeat is active, you cannot change frequencies or utilize other functions with the exception of cross band deactivation.

2. Set squelch threshold before you activate cross band repeat.

3. No radio modification is necessary to activate this function.

4. This isn't a 100% duty cycle repeater. If the radio becomes extremly hot to the touch, the radio should be allowed a cool down time.

5. Use cross band repeat in eith Low or Mid power only.

| 6. Cross band repeat will not allow for different CTCSS
| Encode/Decode tones on each band.

| Using cross band repeat allows a user to enter on one
| band and cross over to the other band. You may use shifts
| or operate in simplex operation.

12.1 ACTIVATE CROSS BAND REPEATER

Here are the steps for cross band repeat.

1. Rotate the volume controls for the VHF and UHF bands fully counter-clockwise.

2. Press and hold the FUNC key, then press the FL key. The LCD should display FL.

3. Press each key once as follows: #, 5, 0 and 8. You should notice that the word oPEn displays on the LCD and the opposite band indicator will begin to blink.
The radio is now in cross band repeat. When a signal is received on one band, it will be retransmitted onto the other band.

12.2 DEACTIVATE CROSS BAND REPEATER

To return to original mode perform the following:

1. Press and hold the FUNC key, then you will press the FL/PL key 4 times. After you press it the first time the LCD will display CLoSE. This indicates to you that cross band repeat has been disabled. The other 3 times that you press the FL/PL key will turn off the FL and PL indicators.

13 FULL DUPLEX OPERATION

The principles of Full Duplex operation is very much like a telephone. The idea behind this is that when you are talking (let's say) on 2 meters you will hear the transmission from the other station on the 440 band. He will hear you on 2 meters.

YOUR STATION OTHER STATION

TRANSMIT ON 2 METERS ------>--------> -------> RECEIVE ON 2 METERS
RECEIVE ON 440 BAND <-----<--------<-------- TRANSMIT ON 440 BAND

13.1 ENABLE SPEAKER FULL-DUPLEX

Enabling the speaker will cause feedback unless an external earphone or headset is used.

1. Press and hold the FUNC key, then press the * key. The LCD should display FL.

2. Press and hold the FUNC key, then press the 5 key. The LCD should display Fd-on. Repeat this step until the field indicates Fd-on.

3. Press and hold the FUNC key, then press the FL/PL key repeatedly until the FL and PL indicators are absent from the LCD display.

13.2 DISABLE SPEAKER SEMI-DUPLEX

Perform the following steps:

1. Press and hold the FUNC key, then press the * key. The LCD should display FL.

2. Press and hold the FUNC key, then press the 5 key. The LCD should display Fd-oF. Repeat this step until the field indicates Fd-oF.

3. Press and hold the FUNC key, then press the FL/PL key repeatedly until the FL and PL indicators are absent from the LCD display.

14 AIRCRAFT RECEIVE MODIFICATION

The radio will have to be opened and modified to receive aircraft and some frequencies in the 800 and 900Mhz region. This procedure isn't difficult if you take your time. If

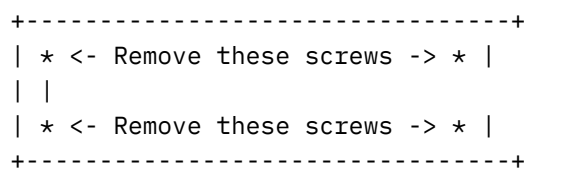
you are unsure of your ability to open and/or perform this mod, please find someone with this know how!

*** NOTE ***

Don't even think of performing this modification unless you have the right tools and temperment.

1. Turn the radio off and remove the battery pack.

2. CAREFULLY remove the 4 phillips screws on the bottom of the radio. These screws represent each corner of the bottom of the radio.



BOTTOM VIEW OF RADIO SHOWN

3. You are about to remove the battery connector plate. There are wires connected to this plate. When moving the plate out of the way, don't pull further then you have to in order to see into the bottom of the radio. Locate | a BRIGHT RED LOOPED WIRE. Remove or cut (tape exposed ends) this jumper. That's all there is folks!

| *** WARNING ***

| You should be extremely careful not to cut the wrong | wire. You may cut the BRIGHT RED LOOPED WIRE. Don't | cut the pink or orange wire by mistake.

4. Take your time and reassemble the radio. Make sure that during reassembly that you:

o Don't forget to place long tension arm (part of the battery connector plate) into the battery lock clip located on the same side of the radio as the PTT switch.

REMEMBER, be patient and take your time. Never force anything together! It came apart easily, it should go back together that way.

5. Reset the radio (Section 9.3) and enjoy a hot airband receiver. You will be able to enter a frequency range from 108-142.995. The receiver will actually begin to receive around 110 MHz. Another way to gain access into the airband is, press the "FUNC" button while pressing the "VHF" key.

*** MULTI BAND RECEIVE ***

| After you modified your DJ-580 for Airband, you also
| enable coverage for some frequencies in the 800 and 900Mhz
| region. To receive coverage in this area, you can enter the
| frequency directly from the keypad or press the "FUNC"
| button while pressing the "UHF" key. The STEP key in
| regions will only allow increments of 10, 12.5, 20 and 25
| kHz.

| *** NOTE ***

| If you see a second decimal point blink in the frequency
| displayed, this means that the PLL circuitry isn't locked.
| Example: 108.0.0
| ^____ This decimal point will blink.

A timely discussion! There's an extensive thread running
through alt.radio.scanner about scanner laws in Indiana (and
other states.) Even though hams are exempt from such laws, I
think it makes for interesting legal reading. :)

3612. Whistlers?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-17 19:33:26 UTC
From: palmer@cco.caltech.edu
Message-ID: <1992Jun17.193326.6382@cco.caltech.edu>
Source record: 288526

I am interested in something called a 'Whistler' which is
a radio-frequency disturbance varies in frequency across the radio
spectrum with time. I have never heard one (I am not a ham or a swl)
and I have a few very basic questions about them:

1) Are they understood?

2) Do they increase or decrease in frequency? At what rate? over how
wide a frequency band?

3) How long do they stay at any particular frequency?

Any good references?

Thanks in advance.

This brings up the obvious question of just how they expect people to
buy the thing in the first place, since as soon as you walk
out the door of Radio Shack you would be in violation. If you mail
order, the UPS man might be in violation unless his employer submitted
his name to the Governor.

DITO ... BE EXTREAMLY CAREFULL WITH THE DIAL LIGHT !!!!!!!!!!

I also use one for mobile operation. I learned about the dial light problem the hard way. I have a Yeasu 747 GX. I had the light hooked up to the auxillary power out of the Yeasu. I had the rig turned on and noticed that the plug had come un plugged (can you guess what is going to happen to me ???). Well, I just figured I'd plug the little bugger back in. Well now - 12 V from rig hit ground ! I had no fuse in of course (I never do things correct) and vaporised a trace on a circuit board in my rig.

What is the moral of all this ?? Take some extra time and do the job right if you plan to use the little light.

Here it is, from the ARRL BBS:

W1AW Schedule
April 5 - October 25, 1992

Time (EST) Mode Days
---------- ---- --------------------
12 AM RTTY Daily
12:45 AM VOICE Daily
9 AM CWs Mon, Wed, Fri
9 AM CWf Tue, Thr
10 AM CWb Mon-Fri
11 AM RTTY Mon-Fri

4 PM CWf Mon, Wed, Fri
4 PM CWs Tue, Thr, Sat, Sun
5 PM CWb Daily
6 PM RTTY Daily
7 PM CWs Mon, Wed, Fri
7 PM CWf Tue, Thr, Sat, Sun
8 PM CWb Daily
9 PM RTTY Daily
9:45 PM VOICE Daily
10 PM CWf Mon, Wed, Fri
10 PM CWs Tue, Thr, Sat, Sun
11 PM CWb Daily

Frequencies (MHz)

CW: 1.8180 3.5815 7.0475 14.0475 18.0975 21.0675 28.0675
147.555
RTTY: 3.6250 7.0950 14.0950 18.1025 21.0950 28.0950 147.555
VOICE: 3.9900 7.2900 14.2900 18.1600 21.3900 28.5900 147.555

Notes:
CW frequencies include code practice, Qualifying Run and CW
bulletin freqs.
CWs = Morse Code practice (slow) = 5 - 7.5 - 10 - 13 - 15 WPM
CWf = Morse Code practice (fast) = 35 - 30 - 25 - 20 - 15 - 13 -
10 WPM
CWb = Morse Code Bulletins = 18 WPM
RTTY= Teleprinter = BAUDOT (45.45 baud), ASCII (110 Baud) and
AMTOR-FEC (100 Baud)

Code practice texts are from QST, and the source of each practice
is given at the beginning of each practice and at the beginning of

alternate speeds.
On Fridays, UTC, a DX bulletin replaces the regular bulletin transmissions.
On Tuesdays and Saturdays at 2230 UTC, Keplerian Elements for active amateur satellites will be sent on the regular teleprinter frequencies.
In a communications emergency, monitor W1AW for special bulletins as follows: voice on the hour, teleprinter at hr+15, and CW at hr+30.

W1AW is open for visitors Monday through Friday from 11 AM to 11 PM EDT and on Saturday and Sunday from 4:30 PM to 11 PM EDT. W1AW is available for operation by visitors between 1 and 4 PM Monday through Friday. If you desire to operate W1AW, be sure to bring a copy of your licence. W1AW will be closed on April 17 and May 25.

I use my radar detector because IWANNA. Actually, I am nosey and just want to know what is going on around me (same reason I like scanners). Laws shouldn't be written with the idea you have to prove (to someone) that your reasons are valid; the laws should be written such that you are free to do what you will UNLESS it causes harm to someone else.

Hmmm. The same could be said of Usenet News postings. ;-)

> Gary, you clearly have the interest and ability; why are you wasting
> your time with your postings to this news group - when you could be
> writing a regular series for some publication?

Now wait a minute! IMHO, were it not for a small handful of regular contributors (like Gary, Phil Karn, Fred Lloyd, Bob Parnass just to name a few I am personally glad to have around) whose postings are consistently informative and well-written, I doubt that I'd consider it worth *my* time to even browse the topics in this newswgroup. To suggest that these folks are wasting their time by posting here is to demean the intrinsic value of this forum.

I plan to start building an OSCAR station during my vacation this summer, and I'll begin by reviewing the lengthy exchange that occurred here a few months ago in which some of the avid bird watchers in this group advocated or warned against various antennas, preamps, etc. in satellite applications. To be honest, this exchange was far more helpful to me than "The Satellite Experimenter's Handbook" in determining how to start equipping an OSCAR station from scratch.

I'd be quite pleased to find this kind of information in the standard publications, but in my experience this doesn't happen very often. The beginner's articles are frequently so simplistic as to insult to be insulting, and the more in-depth articles are often so laden with jargon and to be indecipherable to the uninitiated. Oddly enough, there seems to be a much better balance in this newswgroup than in the ham rags, and none of them can offer anything that even comes close to the opportunity to interact with the authors of articles that appear on this newsgroup.

Although I doubt that Bob was *really* trying to discourage Gary from posting here, I couldn't pass the opportunity to pontificate on the relative merits of QST versus the Usenet. Even with it's poor S/N ratio, this forum offers us many opportunities that commercial print media can't even approximate, and it's folks like Gary that are responsible for this state of affairs.

Clap, Clap, Clap
I teach a class for the Novice/Tech license here in Durham,NC . Part of my antenna class is devoted to wire antennas. I love to show them my long wire which at 167' at 45'high, worked 136 DXCC sections in the last DX contest. I also bring in all my QSL's and explain why $15.95 of wire and insulators work. Sure, I would love a 100' tower and monobanders but in today's markeet with restrictions etc. a wire makes a very good option

73 AB4VJ Internet terry.murphy@bbs.oit.unc.edu GEnie T.Murphy25

Another homebrew class works on j-poles for VHF/UHF lots of interest!

You might want to look in "Yagi Antenna Design" (?) (Lawson, W4PV?).

Maybe if you poked around in the book you could find what you are looking for. In my UHF antennas, I ended up using the "cut and try" method of design. The grindstone tuning method has always worked for me.

How about a 10ghz receiver for $30?

Yesterday I completed my Tech. no-code license. Well, upon coming home a friend of mine approached and congratulated me with the use of an AZDEN PCS-4000 2m mobile rig. Although it's not a handheld it is a 2m rig. Can someone help me out with the operation of this rig? My friend had absolutely no documention for this at all.

Eventually I would like to get a handheld. I know this has got to be an FAQ, but I didn't find it in the listings. Can someone make some recommendations about what a good handheld rig is?

Thanks for the help,

Charles

Well, according to the tech notes, the trimmer pot should
swing the freq +/- 50MHz. For a larger adjustment, I quote:

This problem can be easily corrected by modifying the length
of the tuning stub T6 on the circuit board. The length of
the stub will adjust the frequency by about 50 MHz for every
.015 inch of length change. If the frequency is too low,
cutting the stub with a razor will raise the frequency. If
too high, a small piece of bare magnet wire (#30) can be
soldered to the stub, and cut appropriately to increase the
length of the stub.

The preceeding was copied from the tech notes and are posted
for informational purposes only. It is offered without any warranty
either express or implied and such information is used at your own

> rules to suggest it.
> --

The scenario I was referring to is when there exists a crossband repeating radio that can transmit on 440 and 144 MHz (in response to a signal on the other band). So, say Mr. Hot Tub has his HT monitoring the 440 MHz side so that he can have good communications with the local 144 MHz repeater. He reaches over and transmits the ID on the 440 MHz side and (probably) correctly IDs the 144 MHz side. However, the 440 MHz transmitter in the crossband radio is not IDed.

As has been pointed out, if Mr. Hot Tub has a dual band HT, he can transmit on the 144 MHz (possibly doubling with the repeater signal on 144 MHz) and ID the 440 MHz side of the crossband repeater-like object. (Apply your own opinion as to how many crossband users actually do this.)

I hate to admit it, but my Kenwood 440-AT gets less use than a neat
little 10w SSB xtal ctl 40 & 80m portable unit I have. (JRC JSB-20)

The kenwood is more effective, but working mobile/portable with 10 watts is
fun!

I have looked far and wide for *SSB* small qrp rigs, but only a few
have been available. (Dentron MLX, Swan MB-40, etc)

A ranger or Uniden in a HF (other than 10 m) monoband would also be fun.

How about some articles to convert these guys down to lower freqs?

The JRC I have is neat because it is self contained. (Batteries and antenna)
It is wild working the next state on a 60" antenna on HF.

Also makes it handy for car use.

I use it while camping to check into nets, and hook up with friends.

I think the single most useful article/kit would be a small, reliable, and
duplicatable 9Mhz sideband generator. This seems to be the missing link.
Superhet rcvrs , PA amps, and VFO's are all well documented/kit'd.

Very few SSB generators.

My thoughts anyway..

>BTW, I don't see much high-tech about amateur VHF-FM. Repeaters, and linked
>repeaters, must be at least a generation old. What else is new ... ? Now I

I believe you missed the point. we are back to the content VS the medium
thing here.

No one in the rptr Gary refers to is excited about UHF FM, talking boxes
links, etc. The repeater is a tool.

What is exciting is the discussion on the technical "intercom", as 443.650
is referred to:

1) At least 7 user I know of have unix style multiuser machines. (I have
retired HP-9000 workstation gateway'd onto 56k TCP/IP packet.)

2) Nearly all are involved in state of the art 56k packet operations.
(FYI- Atlanta/GA has at least 6 56k linked "switch's" that
do automatic routing/switching of plain AX.25, netrom, and TCP/IP
network traffic. BBS's play along, and Internet mail is merged nicely
with Amateur mail via the unix boxes.)

The modems were developed here in atl by pretty much the same crowd.)

3) Other popular subjects are: OSCAR, ATV, robotics, automotive computers,
competitive shooting, all forms of computers. At least three have
OSCAR equipment.

embedded micro's seem to be a popular area, with 6-8 folks who work
or have worked with embedded micros. (Myself included. We devide up
into the 6's and the 8's and argue 68705 VS 8751)

4) The rptr has attracted many teckno-codes that have contributed
considerable technical expertise but were not interested in mainstream
ham clubs/repeaters

Bottom Line: Not all FM rptrs are weather/kidneystones monologue machines.

>WILL admit that ham packet radio is demonstrating practical solutions to many
>REAL problems: addressing, protocol implementations, and the like. Most
>ham packet seems to be FAILING at up-to-date RF and modulation techniques.
>Which just shows that RF engineering/design/construction requires a lot more
>engineering education (and test gear) than protocols and software.

No argument. The big problem is that the ham market insists on using
existing 2 mtr/440 radios. I will admit... we have not designed a
kit'able transverter for 440<->28 Mhz. The few we have seen (Hamtronics)

take much work to "clean up", and are questionable for high site trunk use.

So we fight over Microwave Modules Ltd xverters, and wish we had the time
and expertise to make our own. Now that would be something useful!

Kantronics DVR's are a step in the right direction, but we are talking about
new modulation techniques, not FM!

>Only a few, for example W6GN, seem to be pushing the RF front - but they
>never appear in QST. Is this because of a policy of addressing the mag to
>the mass-market/beginner?

I have seen several major league microwave types decline to be involved
in packet projects because it was outside there are of interest. (Some
notable exceptions.) Lots of interest in mountain topping with 'plexors
but nobody will tackle the day to day reality of making tracking AFC's
that would be required for packet "production" use. Thus we stick to 440 &220.

Good stuff on antenna restrictions deleted....

In summary... (bad form, I know) It is fun to pioneer and build that "one
of a kind" super low noise downconverter or stable LO, but very few
want to do the work to incorporate the stuff into usable systems.

It is like reading the RSGB VHF/UHF handbook.... great theory, neat designs, I
have never made one work due to problems with parts availability and
less than robust designs. (IE: hard to duplicate unless you are an RF
engineer that does it on a daily basis.)

Yet with decent kits (PCB and parts only) many have built 56k modems
without Heathkit style handholding. (Yep the modems even have rf stages)

So help us apply your DX expertise. Make your neat designs "duplicatable"
with PCB's and hard to locate parts. I'll build them. Use MMIC's and strip
line. I love it! I can handle FET's correctly, etc...
But depend on connectors/components unavailable to most hams, and it
will not get built.

WRT to VHF/UHF DX.... Having ventured into this area on 2mtrs, there is
still more competition than friendly cooperation going on. Sure not much
encouragement (or patience) for smaller stations that tried hard
to use established "good neighbor" procedure but did not have $5k for
equipment. (Just a TS-9130 w preamp, a yagi, and a 4000 HAAT mtn.)

I understand that the microwave crowd considers 2m SSB the 75m of UHF. :->
But it is what I could justify at the time.

I am currently reading the Radio Shack book 'Now You're Talking!' to start to learn what I need to know to pass the Tech no-code amateur license test. Can someone out there let me know what they think of this book. Am I wasting my time? From what I have read so far it doesn't seem like a bad book.

As far as testing goes, is there a schedule of when they do testing? I live in the San Gabriel Valley (San Gabriel to be exact so a response from the San Gabriel Valley and Pasadena radio clubs would be helpful) so if there is anyone who can tell me when and where they do testing during the next few months (if at all during the next couple of months) I would appreciate it a great deal.

Eric

AEA claims to be clean. We have ATV operating very close to 56k packet
with no apparent interference.

SOmething to do with SAW filters. PC Electronics has been much discussed
as being "dirty". OK for ballon use, but unwelcome in a crowded band.

very good reviews for the TX units doing FM ATV on 900 & 1.2G.

Both are in use in atlanta, and are getting rave reviews. The same users
like the AEA units as well. Some issues on the AEA frequency selection.

The ATV'rs are hard headed on this issue. AEA ships xtals that by all
all bandplans I see can/will cause interference to sat bands.

Their answer is that they are not intended for rptr use, but for direct
CATV recption. But.... guess where everyone puts their rptrs!

Kindof like the 10fm crowd in the 28Mhz sat downlink.... They do not hear any
complaints, so think it is ok. Sad....

>today's markeet with restrictions etc. a wire makes a very good option

Yes, but you have a long antenna at a great hight, no good for restricted spaces common in most Amateur stations. This long wire is not practical for most. At 45' planning permission is needed and who has the space for such a long antenna in a garden, antennas that are small are needed. Traps are not so easy to make and so cheap to buy it is not worth the effort. A G5RV in the UK costs little more than youcould buy the wire for, $20 to $30.

45 ft is a very high mast, quite obvious to the eye. For invisible antennas you need to use the house as the support and thin wire inverted V type dipoles. These work quite well, even with the maximum 400W.

I assume none of the USA readers use full 1.5 Kw in a residential area into a dipole ?

To get anywhere on VHF you need a beam. Easy to make but again to buy costs only a little more than the cost of the aluminium to your average Ham. We do not have a supply of VHF type TV antennas to scavage.

>
Bruce: There are several fun ways to up the speed of your capability.
Mine was CW traffic handling. You see, when you're on a traffic
net, you MUST be able to copy all that's going on. The peer pressure
-- while very friendly -- is there, and if you miss a character here
or there, it spells the difference between success or failure of what
Net Control is trying to accomplish.

Worse (or better, depending on your point of view) if you're handling
a message in the aftermath of a disaster, large or small, on CW, (yes
it still happens frequently) the difference between "4 units of
A positive blood" and "14 units" of something else could have, um,
well, some severe consequences.

I recall back when I was learning traffic handling procedures. One
fellow who was frequently Net Control would routinely refuse to run
the net more slowly that 35 WPM. At my then-speed of 20, he was a
chore! but we learned. More importantly, we got better -- real
quickly. Now I'm up to about 45-50 for traffic, and honestly, I
thank HIM for that.

As I said before, there are other ways. A heavy weekend of contest
operation (even Field Day) can easily double that 15 wpm of yours.
And even more mundane things like county-hunting (CW of course)
will crank up the speed. I remember bouncing around on back roads
of West Virginia at 3am on many a weekend with a rig (alson bouncing)
on the unsprung passenger seat, and a KEYBOARD bungi-corded to the steering
wheel. but then, I also remember a very puzzled WV state trooper
wondering aloud as to why I could park with two wheels in one
county and two wheels in the other county. My retort that it
WAS a four-wheel drive vehicle, after all, didn't impress him.

I believe there's a section of the international maritime laws that says that a vessel in distress can use any method for signaling or obtaining help. Presumably this preempts, or is incorporated into, FCC and WARC regs. Unfortunately, I don't have a reference.

Hi out there,

Jan Geert described in his article a trunked mobile radio system. In my opinion it is an implementation of the MPT 1327. This standard was defined by the British Ministry of Post and Telecommunication (MPT), Department of Trade and Industry, Radiocommunications Division in 1988. The standard was overtaken by several European states, at least France and Germany. In Germany the "Deutsche Bundespost Telekom' has licensed in several regions (e.g. in the "Ruhrgebiet") trunked mobile radio systems.

Whatever it is, I'm absolutely sure it isn't anything even close MPT1327/ MPT1343.

Basically the MPT system behaves quite like your plain ole' analogue cellular. On every site there is a control channel telling the mobiles all sorts of tales about the system. In call setup the mobile contacts the system on the control channel and a traffic channel isn't allocated for the call until the B party answers (this is the main difference from cellular). However, when the call is set up, it stays always on the same channel.

What I remember of the Motorola system from an article somebody posted here (or in comp.dcom.telecom) a while ago, it really trunks the calls. Every transmission starts with a short signalling sequence where the mobile IDs and tells the system where to send that transmission. No special traffic channel is allocated to any call but you have to wait until the

signalling ends.

So, in my opinion, it sounds like Motorola.

BTW. we have a MPT 1327 system called AutoNet here in Finland on 450 MHz.
It is operated by the private regional telephone companies. In 1989 when
I started with my current job, I suppose I was the first man in the whole
organisation to be occupied full-time in setting up AutoNet...;-)

3645. Need Ramsey 2 meter kit info

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 11:46:49 UTC
From: johns@uhunix.uhcc.Hawaii.Edu
Message-ID: <1992Jun18.114649.9585@news.Hawaii.Edu>
Source record: 288458

Drat. As I was reading all the juicy tidbits about the Ramsey
2 meter FM rig, I thought they were interesting, but that I
wouldn't need to save them since I wasn't going to build one.

Now I need a cheap 2 meter packet rig that I can easily modify
for 9600 baud.

And tonight I heard a local guy mention that he is building one,
and he wanted the info too.

So, for the both of us, could someone please send me the postings with
all the various hints and kinks for building and tweaking the thing?

While I'm at it, does anyone have any experience with the thing in a
dense RF environment? If it has trouble with pagers, I don't want
to mess with it.

Thank you very much,
John Shalamskas KJ9U/KH6

3646. Examination Opportunities Scheduled 6/17/92 to 9/14/92

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 13:07:15 UTC
From: bjahnke%arrl.org
Message-ID: <178@arrl.org>

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email may be sent to the ARRL/VEC at:

bjahnke%arrl.org

or

MCI MAIL ID: 215-5052

You should include your postal address (the slow kind) in case we need to send you non-electronic material in answer to your question.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you will be attending the test session.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC which is coordinating this examination. This single-character designator denotes the VEC as defined below. An "A" (for example) indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, you may contact the coordinating VEC.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541
Test fee for 1992 is $5.40.

3647. Re: sending QSL's to the badly injured Soviet Union...still box 88?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 13:08:57 UTC
From: sharon@unixland.natick.ma.us
Message-ID: <1992Jun18.130857.5571@unixland.natick.ma.us>
Source record: 288469

tech@cs.athabascau.ca (Richard Loken) writes:

>I never even did it while the Soviet Union was intact. What is the appropriate
>ritual here? Do you send them an IRC? A dollar bill? Nothing?

It would be wonderful if you could send them a dollar bill or 2 IRCs. However,
virtually all mail from overseas is opened by customs or postal authorities
in the ex-USSR, and any obvious valuables such as currency -- or even IRCs --
is almost always stolen.

>Is Moscow in Russia? Is Box 88 in Moscow? Is it Box 88? Via the Bureau?

Yes, Moscow is in Russia and box 88 is in Moscow. Box 88 *is* the bureau.

From all I have heard, the bureau is not working very well -- particularly
to republics outside Russia (notably I have heard specific problems in
Ukraine and Belarus). It may or may not be working in Russia now; I'm not
sure. In the Baltics (where you should definitely NOT use Box 88),
the Estonian bureau is working quite well because the
Finns have been allowing the Estonians to use the Finnish bureau. Last
I had heard, the other Baltic republics were still trying to set up
bureaus and they were not up yet, but that was awhile ago and perhaps they
are now set up. Maybe someone else out there has better information?

The best thing to do if you want a QSL from a ham in the ex-USSR is to ask
them how to do it. Some will say direct, and some are still saying via the
bureau. The mail is a problem, though, since not all letters are getting
through.

I have better luck sending postcards, since no one is opening them looking
for anything valuable. You might consider sending your card that way.

Keep in mind that if you can't get return-postage money in, and this is
tough to do (especially in a postcard!), it will be a big financial burden
to a ham in a fairly desirable location to send back cards direct. Postage
is up to 5 rubles. With the average salary around 1,000 rubles a month
and one of my Russian friends telling me that food is so expensive they are
now spending more than half their income to feed their family, you can see
the problem.

You might want to note on your card that you are sorry you couldn't include
return postage because of mail problems, and a return card via the bureau
(when it is working) is OK.

Zhelayu Vam uspekhov (I wish you success)

Message-ID: <Jun.18.09.22.25.1992.19923@pilot.njin.net>
Source record: 288468

Yep, I don't think it was incentive licensing that killed off the young interest, I think it was microcomputers. The sort of youngster that was tempted to become a ham radio operator in the 60's was the sort that got seduced by computers in the 70's and 80's. I got my novice ticket in 71 primarily because I'd been half-assed working on it since I was in fourth grade (67). However, I never upgraded, for a number of reasons: one was because they moved the novice bands making all my crystals useless (never got the VFO to work). The other was that I found our county school system had a timeshare minicomputer available...

It wasn't until four or five years ago that we got to the point of bringing the two hobbies back together. And only with the No-Code license was it done properly.

How to charge a 12V 4.0 Ah gell-cell.

I you don't have the gell-cell manuals (highly recommended
reading), just charge it with a constant 0.1C current for 10-14 hours.
Actually, if you want to be safe, go a bit on the low side. 250 mA for
24 hours should do it fine.

Dale--

Of course the contest logging software from K1EA has become a sort
of defacto standard for many contests. I am not sure if it covers
field day specifically, however.

In addition, there is another nice little logging program called
"Field Day Logger", which has been specifically designed for field
day. I haven't tested it in operational conditions but it looks nice.

The latest edition of K1EA is available for purchase. See any recent
issue of QST. Earlier editions are freely available on many
ham-oriented BBS's. I picked up Field Day logger the same way--from
my local land line BBS.

> communication with my backyard, which is some 20 feet below the house.

That way people can listen in on your calls over a wider area :-).
Hopefully there aren't too many other people in the area with
phones on the same frequency as your base will hear them just fine.

An easier way, which negates the feedline loss and any match problems
trying to figure out how to connect the feedline into the base unit
is to just run the telephone wire up to the roof and put the entire
base set up there. You'd need some way to charge the batteries in
the handset, but I'm sure the thing is only trickle charged which
is pretty easy to create.

Too be really peverse, I was thinking of putting one in my car,
plugged into my cell phone (I know, it would be easier to just
get a portable cell phone).

The text of the book contains much more spurious information than what
you need to pass the test. Not that it what it presents isn't useful
information for new hams to know. Of course, for priming for the
exam, the best part is in the back where the ACTUAL exam questions
are. If you get these questions down pat after reading the rest of
the book, you WILL pass.

> I am currently reading the Radio Shack book 'Now You're Talking!' to start to

By the way, the book is done by the ARRL, a national amateur radio
society (some say THE rather than a). Radio Snack just sells it.

Testing schedules are posted to this group periodically, you might
look back in some of the old postings. If you send a SASE to the
ARRL: 225 Main Street Newington CT 06111 they will send you both
information on local clubs (just so you can meet other amateurs)
and testing oppurtunities.

3655. Re: Incentive Licensing

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 13:39:01 UTC
From: rossi@gvlf8-m.gvl.unisys.com
Message-ID: <1992Jun18.133901.1367@gvl.unisys.com>
Source record: 288474

One policy of the late 60's that I thought was very inconsistent with the new "incentive licensing" program, was the rule back then (and I guess even before IL ?) which required one to be licensed for 2 years before upgrading to Extra. This requirement was eventually dropped sometime during the 70's.

I got my novice in the fall of 1969. I upgraded to General in about 4 months and then to Advanced about 4 months later. But I wasn't *allowed* to upgrade to Extra since there was this dumb 2 year rule.

I still wonder how different things would have been for me if I did not have to wait 2 years. I probably would have had my Extra shortly after my Advanced since I seem to remember my code speed being in the "upper teens" at that time and the theory was not problem. But I had no "incentive" to immediately get my speed up to 20 WPM since I would not be allowed to take the test for another year and a half :-(

What was a 2 year wait supposed to accomplish other than allow you to loose momentum in your studying? How many people would be advancing on to Extra class today if they still had to wait 2 years??

Also, if I remember correctly, Generals and Advanced were supposed to loose even more frequences in November 1969 but the proposed "second wave" of incentive licensing changes never went through.

Incentive licensing is your classic example of a good idea that was poorly implemented.

+>
+This brings up the obvious question of just how they expect people to
+buy the thing in the first place, since as soon as you walk
+out the door of Radio Shack you would be in violation. If you mail
+order, the UPS man might be in violation unless his employer submitted
+his name to the Governor.

You've got it, Bill.

What's next in Indiana? Scanner Registration? Permits for scanner buyers?
A 15 day waiting period, so you don't buy one "in the heat of passion"?

All my books are at home, so it's hard to check, but I'm pretty sure there have been articles incorporating this. In Solid State Design for the Radio Amateur centered around page 204 is an article that was (I think) an SSB rig for 80 and 40 with a 9MHz SSB IF (I was interested only in the transmit mixer, so I didn't read the rest of the text :-); QST ran a 14MHz SSB transceiver design that I think made it into QRP Classics.

Of course, more is always better :-).

Right on the mark. If Mickey Mouse (tm) transverters were more widely
available, and didn't cost an arm and a leg, I'd have dome 56K a long
time ago.. If only there was an option like the DEM transverters.

I've been wondering lately about directly generating a 440 or 900 MHz
signal using the new moto transmitter chips (13175/6). They would
allow simultaneous AM & FM modulation. It was just a thought, I've got
no idea whether the phase noise would be acceptable. Hell, they could
even generate a 144 MHZ signal for the DEM transverters.. It would
require more familiarity with the modem design than I've got and more
test equipment thatn I'm ever likely to have access to, but I don't
need any of that stuff to think, right :-) :-)

>
>Thanks & 73,
>
>Bill, K2DI

Bill, et. al.,

Here is the copy from the ad in May 1992 Radio Fun (Inside Back Cover):

"Look at this new FT-530! Simultaneous recieve on VHF and UHF, automatic "on" timer, 82 memory channels..."

"Yaesu did it again!"

"Bright Minds lead to brilliant 'firsts'"

"That's right, brilliant innovative first-time ever features which make the FT-530 our most exciting HT addition.

Exclusive break-through features, too. Like flexible in-band dual recieve. Not just V/U recieve. With the FT-530 you can listen to two, 2-Meter signals at the same time!

To keep you on the air longer, the Smart-TX battery saver circuit automatically reduces power output when a full scale repeater signal is present. And we've added a voltage indicator and programmable battery saver for each band- a powerful handful exclusive features!

Another remarkable first is the Auto On-Timer. Here's how it works. Chuoose the hour you'd like the radio to begin operating. For ecample set the time for the morning, then wake up to your favorite net. What's more the built-in 24-hour clock displays the time when the radio is off.

First out with 82 memory channels included, not an option; a real plus for storing all your favorite frequencies. With this HT, just open the box and QSO.

Be the first at your dealer's door to buy one, and the first to show off your new FT-530. What a bright idea."

Specifications:

"FT-530
Dual Band Handheld

* Frequency Coverage:

2-Meters 130-174MHz RX
140-150MHz TX
70cm 430-450MHz RX/TX

* 82 Memories (41 per Band)
* 4 TX Power Levels
* Dual in-band recieve feature
(V/V, U/U OR V/U Recieve function)
* DTMF Pagine and Coded Squelch included
* AOT Auto On-Timer with built-in clock
* ABS Auto Battery Saver
(Super Battery Life, Each BAnd can have separate battery saver)
* Built-In VOX
* IBS Intelligent Band Select
(Provides automatic TX band select on scan stop)
* Built-In CTCSS with dual decode
* ATS - Automatic Tone Search (displays incomming CTCSS frequency)
* Built-in cross-band repeat function
* APO Auto Power Off
* 5-Watt output w/FNB-27 battery or 12 VDC
* 2 VFO's for each band

Accessories:

NC-42 1-hour Desk Charger
FNB-25 600 mAh Battery (2 watt)
FNB-26 1000 mAh Battery (2 watt)
FNB-27 600 mAh Battery (5 watt)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 15:16:54 UTC
From: benjamin@ee.tut.fi
Message-ID: <BENJAMIN.92Jun18151654@uikku.ee.tut.fi>
Source record: 288465

In article <9206171511.AA01439@ucsd.edu> P.Lucas@unixa.nerc-swindon.ac.UK (Pete Lucas) writes:

Old-timers used to reckon you could make *anything* radiate if you knew how to couple power to it effectively.

Most of that is true even with todays VHF/UHF communications. Anything you can match close to 50 ohms and install outside your car or the building you live in makes the rubber dummy indoors bite the dust. A sad thing is that in exception to using brute force there is no way to teach that to some of the worst appliance operators. In the early eighties we had a non-repeater period of almost one year when one of the local old farts donated 'his' repeater to the local Technical Museum. That year was something we will never experience again in the terms of VHF antenna evolution...

Problem is, hams these days expect to *buy* an antenna, and commercial suppliers will take your cash willingly. Where's the experimenter-spirit that builds antennas out of discarded FM/TV beams (often available at no cost from your local friendly antenna-riggers. Dammit - some antenna riggers almost beg you to take the things away...!).

Don't forget the 'Ham's Wholesale Specials', i.e. scrap yards. I got the aluminium material for *four* 31-ele K1FO 70 cm yagis for less than $100. There is plenty of money in the overhead between that and the cost of same amount of gain in commercial antennas to be spent in useful things like the tower, connectors, cables and all sorts of stainless steel hard-ware needed in building such an array. Maybe I can even buy a couple of rounds in the local pub for the crew when everything is working.

But who wants to handle such ugly things as a hacksaw and a drilling machine, let alone 20 ft lengths of heavy aluminium tubing when you can simulate every antenna you can imagine on your 486/50 (the cost of which isn't much more than 100 times the cost of a homebrew VHF long yagi)?

End-fed rain gutters, shunt-fed aluminum window-frames, base-loaded balcony-rails will all work on HF. For VHF, try an on-glass quad.

Or even better, the DL7KM double quad (Doppel-Hybridquad). See the Rothammel Antennenbuch for details. In the good old days the members of OH3TR almost exclusively used the DL7KM design with good results. Well, they tended to move up to the few uppermost floors of the 13-floor dorm building but that's the other side of the coin: if you can't put anything out try at least lift your station and antennas as high as possible...;-)

But, but, but...nothing beats the countryside: no close neighbours,
no computer noise, no antenna restrictions!

In article <1992Jun17.171708.5727@gvl.unisys.com> rossi@gvlf8-m.gvl.unisys.com (Pete Rossi) writes:

Wire antennas are so simple yet somewhat mysterious at the same time. I just cringe a the thought of new hams going out and BUYING a pre-assembled dipole antenna kit. What a waste of money. But many new hams don't believe that simple antennas work VERY well. After all, if it costs more then it has to work better, right :-)

I'd add a product number with either X, Y or Z and a number no less than 5000. Gold plating of the metal parts is almost essential, but a N con-nector is unneedes luxury.

Problems is, to the average person, ANTENNAS ARE BORING. A piece of wire. Big deal.

Is this a hobby for average persons? How about getting a six-pack from the shop across the street and then back to the good ole' TV set?

The manufacturers need to come up with all sorts of fancy gimmicks to convince you that their $89.95 piece of wire will work better than your $5.99 piece of wire :-)

Besides dBd and dBi we recently found out that there is also dBs: decibels according to the salesman...;-)

3663. Using PVC in antennas

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 15:37:15 UTC
From: dale@sequent.com
Message-ID: <1992Jun18.153715.25402@sequent.com>
Source record: 288382

A friend and I are building a 4 element 20 meter quad for Field Day.
To keep top and bottom of each element extended we are using white
plastic water pipe, 3/4 inch on top, 1/2 inch on bottom. I'm guessing
this is PVC pipe, it is what is commonly used as water line, sprinklers,
and such. It has moderate flex so we have a small harness to keep the
whole thing level. Question is, can the wire of each element actually
run through the pipe or does it need to be suspended slightly below
the pipe? A recent posting implied that such material could not be
used as an antenna insulator. I did see an article in a magazine
not long ago that constructed a vertical by winding such a pipe with
wire -- think that might have been they grey plastic pipe.
Thanks for info.

73, Dale.

I AGREE !!

To some degree I kind of agree with the guy who posted about too many
QRP articles in QST. Actually it is more like "too many CW QRP articles".
^^
Please dont get me wrong... Actually I prefer CW but a little SSB once
in a while is nice too :-)

I keep thinking WHY can's someone make an inexpensive CW/SSB QRP
transmitter/transceiver? There are tons of CW rigs. It is not all
that much harder to make a SSB generator.

Take these $150 20 and 40 meter CW transceiver kits that have been showing
up lately (MFJ, A&A, Oak Hills, etc). How hard would it be to make a
CW *and* SSB version for an extra $50, if that much. I think it would make
a neat project. That is why I am working on one myself :-)

I would love to make one for 10 meters, if we were heading towards a sunspot
maximum instead of a minimum. But QRP on 10 meters at the sunspot minimum
is kind of rough :-(

Ignore the above, it is wrong. Never constant current charge a lead acid battery. I assume this is what you have. Also never fully discharge it, and if the volts get low, recharge immediately. Most are not designed for cyclic operations but for standby float charging. A cheap and easy way to charge it is to take a standard car battery charger at 14.5 Volts, a small 12 V lamp (up to say 5W for your battery from the autospares store) and connect the battery to the charger via the bulb. Wait for the battery volts to reach 14. 5 V (at this point the bulb will be out) and then disconnect the charger. If you like you can float charge, still via the bulb, at 13.8 V.

Why the Bulb ?

It acts as a current limit, under normal charging the bulb will be out as there will only be a couple of volts across it. As bulbs are non-linear resistors, it will have a low impedance. Should you short circuit the charger or PSU (eg the regulator fails) it will limit the current glowing normally. If you connect the battery the wrong way round the bulb will blow as a fuse. Do not buy a spare bulb, and the required trip to get a new one will teach you never to connect the wrong way again.

Do all this in a well ventilated area.

If you do not have a voltmeter you can use a lower voltage torch bulb when nearing the end of the charge period. Say a 0.5 W 2.5 V to replace the 12 V bulb and give a better indication of when the battery if charged.

Source record: 288385

No, it's not a rumor...
It is exactly what I was told by a Yeasu rep. at the SeaPac hamconvention
in Seaside, Or, this past weekend.
I can't remember the type number it will be, but he said it would feature
-separate volume/squelch for both receivers
-i say receivers, because it will be able to receive the same band on
both primary and secondary receiver (ie. 2 2m freq's or 2 70cm freq's)
-active band indication on rx (a big miss on the 470)
-3 powerlevels, with 'auto power control'
This last is a feature that reduces the output power automatically
depending on the receive sig strength, they call is 'transmit battery saver'
or something like that...
This things is still in the patent process and it is the final step before
release of the radio, i've been told...

Sounds pretty interesting. The rep was expecting it late summer or this fall,
but who know :-)

Take it for what it's worth...

3667. Whistlers

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 16:18:56 UTC
From: HWells.El_Segundo@xerox.COM
Message-ID: <"18-Jun-92..9:18:06.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 288386

Dave Palmer asked about whistlers:

I recall reading a very good disertation on the subject of whistlers in one of the old Popular Electronics magazines. The year of issue escapes me, but believe it was around 1970-75. Some libraries and collectors have the old issues on file. In addition to information about whistlers, the article also covered a simple regenerative receiver project for listening to them. I believe the frequency range was around 10-20khz.

As for sounds, the frequency does vary with delta T. Some signals vary up and some down. From the discription, the signals were best described as sounding like a meteor/comet flying through your headphones.

2. Using pieces cut from bleach bottles as antenna insulators. This plastic is about the only thing I have find that survives being out in the sun for years on end. It works as well as the ceramic stuff, but it also is a bit more springy. Don't ever use PVC pipe whatever you do.

I have been using some 2 part plastic electric fence insulators. THey aren't free like bleach bottle strips, but I got a big bag of them for about $5. I figure they are intended to stay out in the sun, and the way the 2 parts screw together you can attach it to a pre-existing loop on a wire without untwisting or unsoldering.

COLORADO 14ER RADIO EVENT ANNOUNCEMENT

The 1992 Colorado 14er Radio Event, sponsored by The Pikes Peak FM Association, will be held Sunday, August 30th. During the event, a group of amateur radio operators will operate portable from the summits of various Colorado 14000 foot mountains. The operating times will be from 9 AM to 12 Noon local time. The net control station will be located on Pikes Peak. The net control frequency will be 146.55 MHz with adjacent simplex frequencies used for 14er QSOs. During last year's 14er Event, 18 summits were on the air and between 150 and 200 different stations were heard that day.

Radio amateurs are encouraged to work as many of the mountaintop stations as possible. A special event QSL card can be obtained by QSLing to the mountaintop station's home QTH.

Radio operators with high altitude hiking experience who wish to participate should contact Bob, KB0CY at (719) 488-0859 or 18070 Sunburst Drive, Monument CO 80132. To avoid having multiple stations on the same peak, radio amateurs that want to participate must coordinate with KB0CY.

If I recall an old Scientific American article, whistlers are created by very distant lightning. The various frequencies of RF are sorted out (in the time domain) by a prism like effect as the RF travels towards you, bouncing between the earth and the ionosphere.

>...

See excellent article about whistlers, including references and
receiver schematics in current issue of _Science Probe_ magazine
(available at better newsstands).

A recent flight of the Space Shuttle carried a 7-ampere electron
gun which, among other things, was to attempt to create
artificial whistlers by bombarding the atmosphere with a "virtual
antenna" of electrons modulated at audio rates. The equipment
failed after only a few shots. What happened to Kirchoff's law?
How was the charge to be replenished??

I think this really pushes the limit of facetiousness. While
strictly according to the WORDS, you are rright, but I cannot
imagine such a thing not being thrown totally out of court by any
sane judge. Purchase and delivery were, I think rather obviously,
not part of the *intent* of the law.

In point of fact, a Uniden HR2510 on 10 meters *IS* fun, as
some of the DX cards on my wall would attest to.

But I agree wholeheartedly, a similar radio with a similar pricetag
for, say, 40 or 80 meters would be a blast. Aside from that, I could
afford it - right now, I just cannot justify going out and dropping big
bucks for a mega-rig.....

(c) "Portable Police Radio" means a radio receiving set that is
+> > capable of receiving signals transmitted on frequencies assigned
+> > by the Federal Communications Commission for police emergency
+> > purposes and that

Someone had better clue these bozos in to the fact that just about
any UHF TV tuner will tune to the channels around channel 14, which
were, I believe, reallocated to land mobile in the "x" largest
metropolitan areas. I guess that means you can't have a TV in your car
either. Well, that's probably just as well, since if you tuned up to
channel 83 or so you'd be breaking the ECPA by listening to cellular
calls. Looks like it's just getting too dangerous for us normal
citizens to own RF receiving gear...

Airport security is an unpredictable situation. I have been stopped and asked to open baggage because a totally innocent item looked odd on their X-ray. I also carried an HT to Scotland and back not long after the tragic incident.

My advise. If you have an HT, take it. You will have a chance to make new friends. Just make sure you have the proper license or permit for a different country. Allow a few extra minutes for the security people, and if they ask something, smile and co-operate. After all they are just doing their job which is to help YOU get to your destination in one piece!

I have a wonderful, bright nine year old who is interested to get his license. He's picked up the code, but books such as "Now You're Talking" are really a little to grown up for him.

Since his easiest path is the Novice ticket, I want to find a way to present the written material to him on disk (Mac or PC), tape (VHS or audio) and/or on paper.

I'm sure this is a common situation and that some of you have had success in t this area. Please let me know.

Thanks --- Bob WN3K

7 PM CWf Tue, Thr, Sat, Sun
8 PM CWb Daily
9 PM RTTY Daily
9:45 PM VOICE Daily
10 PM CWf Mon, Wed, Fri
10 PM CWs Tue, Thr, Sat, Sun
11 PM CWb Daily

Frequencies (MHz)

CW: 1.8180 3.5815 7.0475 14.0475 18.0975 21.0675 28.0675
147.555
RTTY: 3.6250 7.0950 14.0950 18.1025 21.0950 28.0950 147.555
VOICE: 3.9900 7.2900 14.2900 18.1600 21.3900 28.5900 147.555

Notes:
CW frequencies include code practice, Qualifying Run and CW
bulletin freqs.
CWs = Morse Code practice (slow) = 5 - 7.5 - 10 - 13 - 15 WPM
CWf = Morse Code practice (fast) = 35 - 30 - 25 - 20 - 15 - 13 -
10 WPM
CWb = Morse Code Bulletins = 18 WPM

RTTY= Teleprinter = BAUDOT (45.45 baud), ASCII (110 Baud) and
AMTOR-FEC (100 Baud)

Code practice texts are from QST, and the source of each practice
is given at the beginning of each practice and at the beginning of
alternate speeds.
On Fridays, UTC, a DX bulletin replaces the regular bulletin
transmissions.
On Tuesdays and Saturdays at 2230 UTC, Keplerian Elements for
active amateur satellites will be sent on the regular teleprinter
frequencies.
In a communications emergency, monitor W1AW for special bulletins
as follows: voice on the hour, teleprinter at hr+15, and CW at
hr+30.

W1AW is open for visitors Monday through Friday from 11 AM to 11
PM EDT and on Saturday and Sunday from 4:30 PM to 11 PM EDT. W1AW
is available for operation by visitors between 1 and 4 PM Monday
through Friday. If you desire to operate W1AW, be sure to bring
a copy of your licence. W1AW will be closed on April 17 and May
25.

>to Extra since there was this dumb 2 year rule.

I just upgraded to Extra and what I found is that the idea of "incentive licensing" is probably one of the dumbest ideas that I have ever seen! The content of tests have no real ryhme or reason outside of the Novice test. That I found to be most useful of the lot. It actually educates a new comer. But the rest of them are probably the most useless waste of time I have seen in a while. The series of them have no logical sequence. If the series of tests is meant to educate then they have failed and if they were meant to act as a filter to cut down on the number of people upgrading then they have succeeded beyond their wildest dreams. The series of the tests need some rational people to take a hard look at them, consider what exactly they are trying to accomplish and then scrap the lot and go to 2 tests. Nocode and a code HF license. Now that make sense.

3679. Re: sending QSL's to the badly injured Soviet Union...still box 88?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 19:17:20 UTC
From: winter@Apple.COM
Message-ID: <68938@apple.Apple.COM>
Source record: 288398

One encouraging note: I sent a QSL to UJ8JCQ just a few weeks ago and got a response already. (I included a handful of IRCs. Even though they can't be exchanged at post offices over there, I figure the hams can sell them or use them in their own outgoing cards. Seems to work.)

So some mail is getting through both ways intact!

Maybe the former USSR republics will now consider joining the Postal Union so they can actually use IRCs.

3680. Multi-band Handheld Scanner question

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-18 20:38:33 UTC
From: dreuben@eagle.wesleyan.edu
Message-ID: <1992Jun18.163833.1@eagle.wesleyan.edu>
Source record: 288400

Hi-

I finally decided to get a handheld scanner, and could use some help in selecting a good one based on the following specifcations:

1. Covers most Novice and Technician bands.
2. Covers CB channels
3. Covers Cellular (note: I am not trying to listen in on other calls or anything - my old TV on UHF can do that! :) I just need to find out what channel my old cell phone is on - it does not tell me this as some newer ones do...)
4. Covers the old mobile phone svc called "IMTS"
5. Covers fire, police, emergency, etc.
6. Covers aircraft (ie, general aviation)
7. Covers Marine band (VHF only, no "High Seas" or SSB stuff required.)

Does such a thing exist? I've been told that Uniden makes rather good handhelds, but their sales reps were not all too sure if it covered all (or some, such as IMTS...) of the service bands I specified.

(BTW, anyone have an old IMTS phone they want to sell me? Or know were I can get a few cheap??)

Anyhow, if there is anything in a handheld (or maybe a very small and easily transportable mobile unit) which meets these needs (or a good portion of them) I'd appreciate hearing from you...

Thanks in advance!

-Doug

Source record: 288412

Dave,
I'll take a crack at it, but its been a while... Basically whistlers are triggered by lightning strikes. The electro-magnetic energy released is transmitted along the magnetic fields going from pole to pole. Somehow, these signals are reflected back and forth along the magnetic path. Neat stuff! I believe all you need is a coil of wire (lots of turns) and LOTS of audio gain. Oh, also a VERY quiet (radio-wise) area. There was an article in Popular Electronics (I think) a number of years ago. A few years back I took a Stanford class which was being taught by the guy that did much of the research on whistlers. Apparently the gov't was interested in its use as a reliable global comm system. If I can find my notes from the class, or get anyth

any other info, I'll pass it on.

>make an effective Faraday cage?

No, too many holes for windows, doors, etc. It does interfere with
radio/TV reception however. Even a typical builtup roof of wood and
shingles attenuates RF. In the vein that better is the enemy of good
enough, it's clear that the attic mounted antenna is working.

To give you an idea of how a well mounted antenna *can* perform, I'll
tell you about the antenna I use at my farm in western Kentucky near
Evansville Ind. It's four Channel Master super deep fringe antennas
on an H frame mounted on a 60 foot tiltover homebrew tower for VHF
and four 4 bay bowties for UHF mounted above that. The farmhouse is
on the highest hill in the county. I can receive perfect pictures from
Terre Haute, Indianapolis, St. Louis, Cape Giradeau, Paducah, Nashville,
Bowling Green, Louisville, Evansville, and several other places in between.
A total of 37 VHF and UHF stations that are clear and watchable over
a 150 mile radius. It would be more but several of the stations in range
are on the same channel.

By contrast, in the hills of North Georgia where I'm currently living,
all I can get is the Atlanta channels and occasionally Macon. That's
what terrain blocking can do at VHF/UHF. During band openings, the
big array at the farm becomes useless since it becomes overwhelmed
with too many signals. I have watched a Denver station from Georgia
during an opening however.

I have only seen one handheld scanner that made it into the HF bands... that
was the Radio Shack Pro-38... and it only barely got part of the 10m band.

>should know both fields to make the better choice.

Actually, if something like Phil Karn's cellular packet approach can be made to work, low power FM stations *can* give very high utilization of the spectrum. Weak, narrow bandwidth signals aren't the only way to achieve maximum communications effectiveness. Now it's true that the *current* way that packet is done is horribly inefficient, but that's not just an issue of modulation bandwidth. Since packet is TDMA, you can trade high speed versus high bandwidth for optimum spectrum usage. Or, with cellular style power control and FM capture, you can also do frequency reuse in adjacent geographic cells. Other than rapid T/R timing, most of these techniques require software control and protocol development rather than narrow band weak signal RF approaches. Hams need to throw out their DXer mentality to make packet radio *networking* systems work efficiently.

>No activity can survive without beginners. The no-code license was sold

>my-bicycle", "construct-this-....", almost always leaves out any discussion of
>the theory of operation or the design choices. This applies to the software
>and protocol articles as well. How often do you see commented code
>or pseudocode in a ham mag? "Takes too much space."

I agree with these concerns. The magazines are preoccupied with DX scoreboxes and have little room left for meaty technical topics. The few technical articles that are published are dumbed down to the point that they contain little content. Amateur radio is a *communications* service, however, so emphasis on *just* RF engineering is inadequate. It's necessary to take a *systems* approach to designing methods for increasing system throughput.

Failure to do so can cause systems to fail because excessive concern with distance covered can interfere with frequency reuse a la cellular, or with totally different approaches to spectrum utilization like spread spectrum, or high speed TDMA sharing. The question is not how far you can work, it's how much *content* you can effectively transfer from the originator to the ultimate destination. Some of the no code amateurs entering our ranks from the computer world understand these concepts better than older traditional hams. The American Radio *Relay* League should be able to grasp these ideas however.

Heck, some of these states that have stiff laws against scanners probably DON'T have strict laws against handguns. Without getting into the merits of gun control, or lack thereof if you are in that camp, if you were a HP officer, which would you rather be confronted with.

I think these laws are both unrealistic and out of proportion. There are probably more instances of listeners HELPING law enforcement than evading it. Also, someone using a scanner to evade the police is not terribly concerned about the legality of his scanner: the getaway car driver doesn't care about the speed limits either.

What I think is funny about these laws is these legislators trying to write laws about a technology that is mysterious to them, but really is decades old. "Devices capable of receiving...". Ha! Every car has a radio that is CAPABLE of receiving police bands, with a tweak in the filters and maybe a LO. For that matter, RS sells kits for kids that do the same. If they outlawed scanners altogether, would they confiscate all electronics books and close all the libraries so that noone would learn that it doesn't take much to build a radio receiver? I can just see teenagers making money selling contraband transistors! What we have here is lawyers writing laws to give themselves the illusion of power, or at least of accomplishing something.

If they weren't so dangerous, they would be amusing.

>Question is, can the wire of each element actually run through the pipe...
>A recent posting implied that such material could not be used as an antenna
>insulator.

The question of whether polyvinyl chloride can be used as an antenna insulator has been blown far out of proportion by many hams who really know little about dielectrics. Having had a major research project a few years ago on the measurement of dielectric properties of plastics in the 1 to 200 MHz range, I think I can answer this question.

Running your quad wires through the PVC will work fine. In the normal square quad (horizontal wires connect to the feedpoint), the spreader ends are not at high RF potentials. Even in a diamond quad where the horizontal spreaders are at voltage maxima, you will have no problem. Remember that old timers like myself used to use wood and bamboo spreaders - materials with far higher dielectric losses than PVC.

You may run into problems with PVC if you use it as the dielectric in a coaxial capacitor for a gamma match, or in antenna traps, or wherever a high dielectric strength is needed. If you have much RF current going through the PVC, it will heat. But for many ham applications, it is fine.

Most other plastics have lower dielectric losses than PVC. Unfortunately many of these are subject to problems from exposure to the weather and ultraviolet light. Polyethylene, for example, has excellent dielectric properties but cannot tolerate UV well - even with antioxidants and UV inhibitors. Outdoors, polyethylene rarely lasts more than two years. Polypropylene is similar, hence the short life of ski rope as an antenna support.

Speaking of ropes, nylon is better than polypropylene but it does stretch and is subject to UV degradation. Nylon is similar to PVC in regards to its RF dielectric properties. Do not use it where it will be subjected to high RF fields. Probably the best ropes for antenna use are the polyester ropes. Dacron is the DuPont trade name for their poly(ethylene terephthalate) fiber. Chemically this is basically the same plastic as Mylar. The fellows that sell rope at hamfests get a premium for the name Dacron, but many companies make equivalent polyesters under other names (we make Kodel, for example). The plastic PET soft drink bottles are the same plastic. Rings cut from these bottles make good, light weight end-insulators for wire dipoles. Someone else mentioned using the plastic from bleach bottles in a similar application. This is polyethylene which would normally not hold up well except that the

high white pigmentation protects it from UV. The PET bottles are subject to UV attack too. When choosing rope, look for black or olive-drab for the best UV resistance. White polyester rope containing lots of titanium dioxide pigment also resists UV fairly well.

Some of the best plastic materials for outdoor antenna use are the acryllics. These are the Lucites and Plexiglass materials. Not only do they generally have good dielectric properties, they are also UV resistant. Acryllic spray paint, such as Krylon, does a good job of protecting antennas from corrosion. You can often extend the life of plastic parts on commercial antennas by carefully cleaning them after a year or two of use and painting them with acryllic paint. You often have to wait out the year of exposure to the elements for the plastic surfaces to oxidize (and surface craze) enough for the paint to stick.

Unsaturated thermosetting polyesters, a.k.a. fiberglass resins, normally do a good job in RF applications. I once built an antenna using bamboo spreaders that I liked so much, I wrapped each spreader with fiberglass tape and impregnated it with resin to stiffen them and make them last outdoors. The main problem was the added weight. Fiberglass is a better performer with RF than phenolics, but since both are thermoset type materials, heating of the plastic by RF usually does not cause too many problems.

I tend to agree with others on the net who laugh at hams who BUY rather than build their own wire antennas. The ARRL Antenna Book is one of the best investments a ham can make. Buy the book; then start experimenting. Use whatever materials are handy or available in the local building supply store. My discussion above should give you a few guidelines about what plastics are suitable for your applications.

Auughh, 45' is a big deal? Tuesday I threw a rope over a tree branch
at 50' (measured, not estimated). By hand no less. This is holding
up one end of an eight-element 15m Sterba curtain that Richard VE6BSV
and I threw together in about two hours of fairly relaxed work. The
other end is supported by my 88' tower :-). The funny thing is, that
unless you're specifically looking for them, neither the tower nor the
curtain are at all prominent. They blend into the background of trees
around my home amazingly well.

I also put a pulley and counterweight into another tree at 68' (again,
measured not estimated height). It was a pleasant climb. Aren't
there any trees in England?

BTW, I really enjoy building and using wire antennas. The sterba
curtain seems to be working well, I think I will make one for 20m as
well.

regards,
Ross VE6PDQ

Good luck with the PVC for an antenna. Generally that stuff is very flexible, and not even capable of holding up its own weight for a length of more than 8 or 10 feet.

Your posting reminded me of a FD quad antenna a friend tried. The spreaders were so limp that people held onto the wire to keep the them from bending as the antenna was being erected. Well, the whole thing collapsed. There was a great picture in QST!

>>>a lot of people--for good reason.
>>
>>Absolutely true. Not only did it anger people, but many stopped Elmering
>>prospective hams. I watched three clubs die over this issue.

>>>But I don't buy the argument that
>>>it was responsible for any significant loss of growth in the amateur
>>>ranks.

I don't understand this thread, and I don't understand where it's getting
us.

I'm a fairly new ham (four years) and I never HEARD of "incentive
licensing." I went on to General, then Advanced, then Extra Class because
I WANTED those privileges, especially since I'm a DXer, NOT because I
wanted to learn all that math--so I guess you'd have to say that in my
case it worked like a charm. Furthermore, many of those I've taught in
Novice classes have gone on to General, Advanced and Extra because of
those same privileges.

So what's the problem?

The intent of the law is to keep criminals from listening to the
cops while they (the criminals) are breaking the law, therefore
learning when they may have been detected. Do you think you could
go into court and say "I know the law says (so-and-so) but what
it really meant was..." For example, "It says 55 mph, but it really
meant 'don't go so fast that you endanger other people.'"

30 days, plus time served. Or, 20 dollars for ever mph over the limit.

"But your honor, that's 300 dollars!"

"I'm glad to see you can add fast, too!"

A great idea. But to minimize the consumption of net bandwidth, please code the answers with numbers. Thus, we can flame each other with a nice efficient string of digits (such as 1 5 7 2 9 9). I am sure that someone will write a script to expand the digits back into the full text for maximum impact. Better yet, let's reduce all flames into a single ASCII "F" and save us a lot of trouble.

Hi. I just bought an ICOM 735 transceiver (first new radio in
25 years). I'd be interested in talking with other 735 owners
on some ideas I have for it. I've retrieved all the ftp mods,
but would still like to investigate further whether, for example,
the firmware would be relatively easily reprogrammable to add/
subtract features, etc.

If there is sufficient interest, I might start a mailing list.
Please drop an email note to the address below.

THANKS

Note that a normal television set that has UHF channels (most do these days) can, if properly tuned, receive some public safety/police frequencies. Those above 470 Mhz up to about 512 Mhz are actually TV channels 14-20, and some of the 'overflow' is put up there. What happens is that they 'de-allocate' a UHF channel and then use it for all sorts of things. The thing to ask the judge (in any state that has monitoring laws) if having a portable TV is illegal. I suspect that TECHNICALLY in some states transporting a TV in a car might be illegal, even if it isn't plugged in. Something to remember when you are pulled over.....

3701. Beam Antenna for Cellular Phone?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 09:46:05 UTC
From: roakley@guvax.georgetown.edu
Message-ID: <1992Jun19.134606.1025@guvax.georgetown.edu>
Source record: 288338

Colleagues--

Here's one that came to me recently.

Has anyone tried using a beam antenna with a cellular phone?
A friend of a friend has a cabin in the woods. Said cabin has no
access to a phone, but the owner does have a cellular phone in his
car. Unfortunately, the little vertical on the car won't do the job
out there in the woods so a few of us were wondering if they got a
beam antenna and got it up high enough if they could make it invoke a
cell.

What do people think about this? If it seems workable, would any
regular antenna using all the standard formulae work? Or would
something special be required.

3702. Need design for UHF beam antenna

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 12:16:34 UTC
From: mwandel@bnr-rsc.UUCP
Message-ID: <13103@bnr-rsc.UUCP>
Source record: 288335
Cross-posted to: sci.electronics,rec.radio.amateur.misc

Suppose I want to watch an UHF TV station whose signal is very weak.
I have a primitive "loop" antenna that is just that -- a loop of wire
about 1ft in diameter hooked up to the 300ohm UHF antenna inputs
that is just fine for the other, strong UHF signals available. Just
one gives me trouble. I'd happily build a dedicated antenna that is
tuned to that frequency, aimed in the right direction, and used for
that station only. It's actually more a scientific experiment than
such a pressing need to watch that station.

It occurs to me that the multi-element directional antennas that people
used to have on their rooftops must be MUCH more efficient than the
simple un-tuned loop. I mean the type that has one or two dipoles, a
whole bunch of "directors" and "reflectors", to give the appearance of
a ladder pointing toward the station. I want to make such a thing.
Shouldn't be too hard using the scientific construction materials available:
bits of wood, wire coathangers, screws, nails, staples, etc.

So, does anyone have a design (i.e. geometry) for such an antenna that
is easily adapted to a given UHF frequency and can feed 300 ohm twinlead?

I don't have a copy of the ARRL handbook and the library considers it
an unborrowable reference work and charges $much for photocopies.

Any info would be appreciated.

3704. Performance of Attic antenna?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 13:49:14 UTC
From: losee@ils.unc.edu
Message-ID: <1992Jun19.134914.25059@samba.oit.unc.edu>
Source record: 288426

Having recently purchased a house, I would like to operate as
discretely as possible so as not to upset the neighbors.

Would anybody have any theoretical or practical comparisons
of (1) a dipole in an attic with no insulation between it
and the stars (but with roofing nails, I hope!!) and
(2) a dipole in the great outdoors at the same height?

Any recommendations about modifications to
the length of a dipole that is folded into a horizontal "V"
shape, e.g., dividing by a factor other than 468?

Bob Losee, KO9V

Address.

My 9 year old (8 when he got his General and passed his
20wpm), used the computer exclusively to pass the written
elements. If you have access to a MAC the testing programs
are Hypercard stacks and work much better than the
commercial PC programs I have tested. The MAC stacks are
freeware...not shareware..so you can get your copy legally.
The are on the SIMTEL: servers I believe or I can E-Mail you
the address of the author who will send you a copy or we can
arrange for you to get a copy. There is also a shareware PC
testing version. I have found out that the algorithms that
they use on the PC versions don't work that well. I have
found a number of people using the PC computer versions only
can fail because there is a group of questions that they
have never seen.

My suggestion: have your son keep going thru the Hypercard
stack till he can score over 80% on the computer generated
tests...he should then have no problem passing the test.
What I did was to have my son do 2 practice tests a night
for about 2 months (he was just 8 when we started and the
wording was pretty hard for him) and then about 3-4 weeks
before the test session had him do 4 practice sessions a
nite..then right before the test upped it to 6. Your
situation might be different...my son was really not very
motivated and not that much into ham radio. With a motivated
person may only take a few weeks.

I think the Novice is much better than the Tech...but a lot
of kids really like packet...only need to pass one more
written to get it though.

If I can help you out...let me know.

73s and good luck de Cookeville, TN

>I am interested in something called a 'Whistler' which is
>a radio-frequency disturbance varies in frequency across the radio
>spectrum with time. I have never heard one (I am not a ham or a swl)
>and I have a few very basic questions about them:
>
>1) Are they understood?

I believe they are understood, but not by me. :-)
I gather that lightning generates them and that they are a form of
plasma oscillation in the ionosphere. Somebody who really knows may
correct me.

>2) Do they increase or decrease in frequency? At what rate? over how
>wide a frequency band?

The ones I've monitored have decreased in frequency slowly, moving
across the receiver passband in a couple of seconds.

>3) How long do they stay at any particular frequency?

They pass downward in a couple of seconds or faster.

>Any good references?

Sorry no. I would remark that these seem to be primarily low frequency
phenomina mostly heard below the AM broadcast band. I recall there was
an article about them in QST in years past. Maybe one of the League
guys can give a reference.

I wouldn't have answered your query with this pitiful amount of information,
but no one else was responding so I thought I'd pass on the little I know.

Radar detectors are not illegal in Colorado but in many cases they won't do
you much good either. Most of the highways in Colorado are patroled by aircraft
and the state patrol and many local municipalities are now using IR laser guns
wich by the time you detect one it's time to pull over and get your ticket.
Your best bet is to get a scanner and listen to them to find out where they
are at.

> The content of tests have no real ryhme or reason outside of the Novice test.

You're nicer than I am. Much of the novice test is completely
useless. It would be much more important to ask a novice how
close to 28.5 he can get with a USB signal than asking him to
label the parts of a vacuum tube.

-Ron

I've got a 10M Lazy-H (actually my wife has, she's the 10 M buf). The only way I can find the antenna is to start at the house and follow the ladder line up. I only know where the antenna is by looking for the center insulators. It's still damn hard to see the antenna itself. Me, I've got a rather low 20M dipole, the one that used to be in the attic of the other house. Took about 10 minutes to build and about 20 to get in place. When it was in the attic I worked Diego Garcia on it. Now it seems to work Australia and New Zealand exclusively. But y'know, that 10M Lazy-H does load up pretty well on 20...

Some day when Lazy-Ron gets his act together I'll hang the rest of the wire antennas I've got sitting in the shack including my old 40 M dipole, and an 80M and multiband dipole we built for Margy's father's station.

The thing to look for is to make sure that the radio in addition to going below 30MHz (which is where CB and the Ship-to-shore, and long distance ham bands are), is that it also does SSB. Many of the radios that tune down there on the consumer market are AM only. While this is just fine for listening to the BBC, you'll be unable to listen to most Amateur and nautical stations.

The R1 does not have SSB or CW modes in it.

One happy medium is to buy two radios. The VHF/UHF scanner market is wide open with products for this range. For the HF frequencies, there are a number of portable SSB/AM rigs. One nice one is the Sangean ATS803/Radio Snack DX440 (they're the same radio). Sony makes some others. Again make sure that any radio you buy for HF (below 30 MHz) has SSB if you want to listen to Hams.

It must be summer again.

How do I know?

The annual drivel about can I take my walkie-talkie on a plane.

This annual thread will address the following points:

1. Can I take it in carry on baggage?

2. Must I disconnect the batteries?

3. Can I use it on the plane?

Maybe someone should put together a file on walkie-talkies and
planes - with some notes on laptops and cellular phones. We can then
post it three times per week and keep this old chestnut under control.

I wonder if I can talk to Craig Shergold when flying over
England?

Thanks to all who responded to question about using the white PVC water pipe in an antenna. We are building a 4 element 20 meter quad, but are NOT using the pipe for the classic X shaped spreaders. The pipe forms the top edge of the square quad, and is held at middle and ends with a rope harness. The antenna is not mast mounted. It is hung from a rope connected to two points. (I can't take credit for the clever design, but then again if it falls down I won't be taking the blame, right Jim?)

We ran the element wires through the top piece of 3/4 inch pipe, and then have a second piece of 1/2 inch pipe forming the bottom of the square with the wire running through that. The element wire holds the ends of the lower pipe and a rope drops down to the middle of the lower pipe to hold it up.

We haven't actually hoisted this in the air yet, but my Field Day partner assures me it will work, and that if we hurry and get it up next Friday I should be able to use it to easily get my DXCC before Field Day.

BTW, as to my question about Field Day logging programs. We downloaded the WR9R program from ARRL BBS and that is the likely software for our station. Thanks for the suggestions.

73, Dale.

For 2m at home I use a 5/8-over-5/8 J-pole that I built myself. The design is a modification of one in the ARRL antenna book. I probably could have bought an antenna for less, but I had a lot of fun building it from hardware-store materials and it works great.

This antenna is a little over 3 meters long (I don't design antennas in feet, but it is about 10 feet) and mounted on the chimney. It hardly qualifies as a "stealth" antenna, but painted with black epoxy spray paint it is not particularly noticable against a backdrop of Carolina pines. Even I don't see it unless I look for it: it just doesn't jump out at you.

I don't live in an area with restrictions, an lots of houses have cruddy TV antennas corroding away, but I don't believe in excessive "advertising", as it were. I was really amazed to find out how little visibility something as thick as 1/2" pipe has when painted black. A thin wire would really disappear.

3718. FCC proposes relaxation of rules

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 17:14:05 UTC
From: lhurder@arrl.org
Message-ID: <184@arrl.org>
Source record: 288362

Federal Communications Commission
1919 M Street NW
Washington DC 20554

June 18, 1992 - Action in docket case. FCC proposes relaxing restrictions on permissible communications in Amateur Service.

The FCC has proposed amending its rules for the amateur service by lessening restrictions on the scope of the permissible communications that amateur stations may transmit. Specifically, the proposal includes greater flexibility to transmit communications for public service projects and personal matters.

The Commission noted that many individuals in the amateur community appear to strongly support relaxing one or more of the existing restrictions on the scope of amateur services communications. The restrictions were designed to protect the non-commercial character of the amateur service and ensure its basis and purpose i.e., as a reservior (sic) of volunteer communicators, technicians and electronics experts dedicated to advancing the radio art, to provide public service communications particularly in times of emergencies, and to enhance international goodwill, could be carried out. While eliminating some of the existing restrictions would provide the flexibility to expand public service activities and satisfy the personal communications interests, the potential for commercial exploitation and abuse of the amateur service's allocated frequencies could increase.

Specifically, the Commission proposed the revision suggested by the American Radio Relay League. This revision would allow amateur stations to transmit occasionally certain types of communications that are now prohibited. The intent of the suggested revision is to allow amateur operators who so desire greater flexibility to increase their public service communications activities, for example, in support of parades, races, and other such public gatherings. The general prohibition against amateur stations transmitting messages for hire, or for material compensation, direct or indirect, however, would remain in the rules.

These proposals are not intended to alter in any way
the nature and purpose of the amateur service. The
proposed changes, however, would increase the amateur
community' responsibilities for self-regulation and
cooperation in the use of their allocated frequencies.

Source record: 288341

My house was exactly a 20 M halfwave long. The day I got my new rig (we had been both off the air HF-wise for some time) it was pouring down rain. We built a 20 M dipole and ran it from the curtain rod on one end of the house down the hall to the window shade on the other side. The feed line ran down the stairs. It worked great. Others in the house prevailed upon us to put the antenna in the attic. It was supported on it's ends and center with nylon rope into screw eyes. I routed the coax through the bedroom closet.

It worked great. I worked a lot of DX (though I'm not a DX type). I even worked Diego Garcia Island on 20M AMTOR. This is about as DX as you can get from our place. It also seeked to load up just fine on 10 for local traffic.

Being inside as opposed to outside is not as much of a problem. Sure the radiation pattern is going to be screwy. But most people don't get their dipoles far enough away from the ground to get the ideal behavior anyway.

To work the lower bands, I strung a 40M dipole from the peak of my roof (really kind of an toppled over V). It was near invisible. People were much more inclined to notice my 2m isopole or my TVRO dish. I currently have the IsoPole clamped to the deck railing. It looks like one of those citronella torch things.

Another thing you may wish to try is something like an CushCraft R5/R7, mounted close to the ground in the back yard if that is relatively well screened from your neighbors. I helped someone else install their R7, it looks like a real nice deal. Then there is always the AEA Isoloop, but I have no experience with one of those.

-Ron

Has anyone considered mixing the 56k modem output up to (down from)
144 MHz and connecting it to something like Rick Campbell's 902-MHz
transverter (July 1991 QST, available from DEM)?

HMMM.. newsgathering and regularly? Lets see I gather over
40mb a day in news, so I guess I regularly engage in newsgathering
activities. problem solved.

Jon Bloom's argument that IL didn't cause the drop-off is a wonderful
example of how Statistics are the third class of mendacity, above
Damn Lies.

>1965 260,301
>1966 255,952
>1967 256,998
>1968 256,546
>1969 264,601
>1970 263,918
>1971 264,374
>1972 262,093
>1973 253,357

By starting in 1965, he doesn't show what happened in the preceding
years. Hey, while IL TOOK EFFECT in 1967, it was ANNOUNCED by the FCC
in 1966 and PROPOSED BY THE ARRL!!! (not by Wayne Green or CQ) in 1964.
So in '64, there was this big Sword of Damocles hanging over Amateur
Radio in the US. And the dropoff began.

3726. Vertical Antenna: Recommendations or Advise sought

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 19:40:31 UTC
From: megabyte@chinet.chi.il.us
Message-ID: <1992Jun19.194031.15340@chinet.chi.il.us>
Source record: 288349

As a recent upgrade from Tech to Tech+, I'm looking to get my HF station on the air. After discussing this with my wife and my housing association, it looks like some vertical antenna is the best possible antenna solution for me.

Anyone have an recomendations for any one vertical over another? How about ground mounted radials, which need them which do not? Are any of them able to be mounted on a TV pole mast on top my house?

As far as bands are concerned, I'm most interested in what I can work right now, 80-40-15-10, however, I will upgrade to general sometime. I could leave off 160-80 if I need to in order to get the right weight/height requirements out of an antenna.

Are their any comparisons or shoppers guide for antennas in general on the market?

3727. Re: Whistlers? (Summary of responses)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 20:02:46 UTC
From: palmer@cco.caltech.edu
Message-ID: <1992Jun19.200246.14646@cco.caltech.edu>
Source record: 288346

Thanks to everyone who replied to my question about whistlers.
A summary of the responses is:

Whistlers are the result of large electromagnetic events in
the atmosphere. These events produce broadband noise, and the
various frequency components of the noise propagate from the source to any
given receiver with a speed which depends on the frequency. Thus
the frequency varies over a range of 0-20 kHz in a few seconds.

20 kHz and below is in the Very-Low-Frequency (VLF) part of the radio spectrum.
If you convert it from radio to acoustic waves you can hear these
things. According to one post, if you just make a large coil
antenna and plug it in to an audio amplifier, you can hear them
directly. (I would guess that you'd have to filter
out the 60 Hz first.) The same post mentioned that a recent
'Science Probe' magazine had an article about this.

The original source of the whistler is typically a lightning strike,
however they have been artificially generated.

References mentioned include:

3728. Dual Band Choices/Performance

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 20:19:14 UTC
From: bsplaine@mtmtl8.sr.hp.com
Message-ID: <23860006@mtmtl8.sr.hp.com>
Source record: 288356

I am looking for suggestions to help me decide on a couple of major
purchases. I get into a lot of Public Service events, sometimes in
quite difficult terrain which will be one of the considerations....

1. First need/want is a cross-band repeat type of 2m/70cm mobile unit.
This unit probably will come with most bells and whistles, but
I don't need many. I have heard good things about the Kenwood
TM-741. What have you heard about it? Pro/Con....

Any other preferences? Why? Is Standard worth the extra $$$?

2. Next is the antenna.... Have been thinking about the Diamond SG7900.
That is a long antenna with good gain 5/7.6... but it IS long.
I don't have my AES catalog here, but I remember another
Diamond that is about 4' long that has about 1/2 the above gain.
Anyone have experience/preferences for a good gain mobile?

How about attaching one of these to the vehicle? I have a Ford
Explorer with one of those wide bar luggage racks. Are the
thru-the-roof mounts strong enough to handle the wind resistance
of these long antennas ok?

3. Finally, as mentioned above, I would like to xband repeat thru the
mobile. Maybe stick the vehicle on a high hill or mountain top
and use 70cm input and output on 2m.
Seems like Yaesu FT470 has been a good bang-for-the-buck. I
also recently read there will be a somewhat imminent replacement
coming out for this model.

As you can see, I have some major decisions to make. I can't take these
things home and try them for a while sooooo, I need help.

73 and thanks in advance for any replies.

Bill, N6GHG

3730. Size of dish for satellite AUDIO services?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 20:53:57 UTC
From: keith@radio.nusc.navy.MIL
Message-ID: <194@radio.nusc.navy.mil>
Source record: 288344

I realize that this isn't _directly_ ham radio related, but I know that a lot of hams also play with satellite TV. I've seen some references lately to various satellite audio services, and I know there are a lot of radio stations that have feeds on the satellites as well.

Here's my question... can you receive the audio services on a given satellite with a much smaller dish than is required for the video services? I'm guessing that you can, since the bandwidth should be much less than for video. If this is the case, just how small a dish could I get away with and still get acceptable audio?

Thanks for any info,

Keith (WA2Q)

I would, personnally, prefer to read a posting from someone who knows
what he's talking about than some of the ill-thought out replies that
are, alas, all to frequent here.
I presume if Gary has better things to do, he will do them but as long
as he is willing to post to this group, I'll be pleased to read his
postings!

chuck@eng.umd.edu (Chuck Harris - WA3UQV) writes:

>Well, prior to incentive licensing, you had two sets of operating privileges:

>novice - which was restricted in freq's, power and to CW, and
>general - which had all privileges.

>advanced and extra existed as classes of licences, but had no additional
>privileges.

So why would one have gone for advanced or extra? Just to prove that
one could take a harder test and do faster code (assuming the
requirements were similar then)?

On June 17, between 13:00 and 17:00 my Yeasu FT-726R (s/n not immediately available) was stolen from the parking lot at Conneaut Lake Park in Conneaut, PA. Also stolen was:
Yaesu Dual Band Rubber Duck Antenna
Yaesu FNB-4A (?) Nicad Battery Pack
Yaesu MH-12 (?) Speaker Mike
Yaesu Mobile Bracket
Earphone (25 ft. shortened to 8 ft. with twist-tie)
ARRL Repeater Directory, 88 or 89 edition (Green Cover)
with small yellow Post-It notes marking Pittsburgh repeaters
Blue Map Case with AAA maps of Pittsburgh and Penna
with silver AAA sticker on the outside

If anyone has any information, please contact me during working hours at (412) 937-2411.

Thanks and 73s,
Don Bornemann

|>car. Unfortunately, the little vertical on the car won't do the job
|>out there in the woods so a few of us were wondering if they got a
|>beam antenna and got it up high enough if they could make it invoke a
|>cell.

Should work, and makes sense. Andrews shows in its catalog some "rural fixed cellular subscriber" antennas which seems to be intended precisely for this "cabin in the woods" scenario. One they show is just a simple corner reflector; another is a small "grid" type dish, i.e., a dish with the surface made up out of vertical rods bent into the right shape, similar to what's sometimes used for UHF TV.

|> What do people think about this? If it seems workable, would any
|>regular antenna using all the standard formulae work? Or would
|>something special be required.

No magic here. It's simple polarization (vertical), modest bandwidth -- so any familiar gain antenna should work. Yagi, dish, corner reflector, pick anything.

3736. Voice Read-out for HTs

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-19 22:15:58 UTC
From: freeman@watsun.cc.columbia.EDU
Message-ID: <CMM.0.90.0.708975188.freeman@watsun.cc.columbia.edu>
Source record: 288350

Hello, Netland.

The current discussion of dual-band HTs has piqued my interest. My question is this: with all the bells and whistles some of these little marvels boast, do any of the current crop of HTs (single- or dual-band) implement synthetic speech readout of frequencies, functions and the current state of HT settings?

Thanks in advance.

In Info-hams Digest V92 #627, Julian Macassey opines:

JM> And I am tired of talking at ham clubs where I am the youngest
JM>person there. I'm old enough to remember AM on HF.

Me, too. Mr. Macassey has a point. I do not know whether or not my experience is typical but our local club seems to have a disproportionate number of people over fifty years of age. There is a smattering of younger folks (the President is a bit younger) but I do not see the plethora of young hams that I remember in the club during the 1960's/1970's when the club was *much* smaller. Whether this shift is due exclusively to the loss of popularity of ham radio among the young is debatable but I think not. If my club is any indication, we'd better think in terms of revitalizing clubs as welcoming institutions for prospective hams as well as rehashing the now-moot point of whether incentive licensing should have been instituted.

Incidentally, I did not like incentive licensing at the time but took my higher-class license exams/passed them in order to keep the privs I already had. It is also useful, while we're on the subject, to remember that, prior to 1952, the 80-meter and 20-meter phone bands were only available to Class A (now Advanced) amateurs and the 1952 opening up of these bands to all hams was done in contemplation of giving Amateur Extra hams privileges not yet extant; this promise has never really ben fulfilled even with the introduction of the so-called WARC bands (10, 18 & 24 mHz). I would be interested to know whether the 1952 FCC action to open the bands to all classes of amateur except Novice and Tech resulted in a disproportionate increase of hams. Interesting material here for someone's sociology thesis.

In Info-hams Digest V92 #627, WA3ZXO opines:

>After following this thread about the "Wouff-Hong" for a while, it finally
>became apparent. This sort of thing is why amateur radio is soooooo
>relevant to the youth of today. NOT.
>
>C'mon now. A bunch of people going ga-ga over a couple dirty old pieces
>of wood hanging on the wall in Connecticut ? Secret initiation rituals ?

I agree. In fairness, however, could not one say the same for the
Exalted Order of Elks, the Moose, the Shriners, the Nights of Columbus,
the Oddfellows, etc. etc. etc. How about *all* organized religion? In
other words, while I agree that the Wouff-hong business is pretty hokey,
I think that there are a lot of people who would criticize who are
probably sitting in glass houses without knowing it.
>
>No wonder this hobby is known for its geekiness & nerdiness. When are we
>going to stop thinking that there's anything special about it ? Maybe
>thirty years ago, when people still sent telegrams and long-distance calls
>almost always were made by operators at cord switchboards and portable
>telephones were something only James Bond had in the movies.
>
>Today ..... your major source of new hams (i.e., youth) would say "Get a
>life!"

Perhaps. It is, however, arguable that ham radio is superior to drugs, gangs,
crime and teenage sex (though, I suppose, this is also debatable :-)).
>
>I would close by saying that we must do a better job of promoting
>amateur radio, but after further thought merely ask "Why should we bother?"

Yeah. If we don't believe in the hobby ourselves, we certainly aren't
going to convince anyone else of its virtues.

I may be completely wrong about this, so I would APPRECIATE being corrected. It seems like I read something about the phenomemon a long time back.

Lightning discharges take the form of (a series of alternating) impulses, with a fairly short rise and fall time. Like an ideal square wave has all odd harmonics, and ideal impulse has all harmonics, which is how some marker generators work. I have been told that lightning has RF components up into VHF. Its "signal" has a very broad spectrum.

When travelling through a refracting medium, EM waves of different frequencies travel at slightly different speeds. (This is the operating principle of a prism, and a problem for fiber-optic lines.) The lightning signal can bounce around for a long time, although I am not sure of the mechanism. I think it has to do with both ionospheric effects and the Earth's magnetic fields, like the plasma oscillation Gary mentioned. Considering the initial field strength was in the 1000s of v/m, it can stand a lot of attenuation. As it travels, the low frequency components outpace the high frequency part (or is it the other way around?). The impulse spreads out. I assume the whistling effect is due to the slope of this hump.

Well, thats the impression I got as to the mechanism. I really should go to the library and read up on it.

SMC-30 wiring.

Small plug - 2 conductor
Tip- audio out
Shield (shell) - Audio out common and PTT line

Large plug - 3 conductor
Tip - DC to run some accessories like VOX
Ring - Mic in
Shield (shell) - Mic common

Ptt is keyed by shorting the shell on the 3 conductor
plug to the shell on the 2 conductor plug.

I don't have schematics for smc 31 or 32. SMC 31 was
supposed to be the same as smc 30 except with a
right angle plug. I use the SMC-32 interchangeably with
my SMC-30 on my many HT's. The SMC-32 has an LED wired to
something but otherwise is the same.

Being one of those who learned to read at the age of three, this subject has fascinated me for many years. I'm convinced most 'prodigies' just had some advantages most people didn't. Being born into a household containing radios and computers today, with parents who answer questions instead saying 'no', should make one a prodigy in short order. I have a friend whose son, N5RSE (terry@k5qwb.lonestar.org) is a good example. Novice and Tech at 6, computer literate before that. He's 8 now. Real handy when dad needs help with his computer. :-)

I also met a lady several years ago who was involved with this very question in a pre-school. She observed the only correlation between the kid's apparent IQs was the age at which they were brought into a setting in which they were 'allowed to learn'.

Fortunately, by the time I got to public school I knew how much fun learning was as they never managed to stop me. :-)

It's a principle of our law: If the feds CAN regulate it, the states
CAN'T. Just the fact that the FCC considered making it obvious would
give your lawyer the ammo he needs. That doesn't make it economical.

The real issue isn't radios anyway; it's WHO controls the government
employees. See .sig for details. :-)

3744. RFI on Telephone

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-20 00:02:35 UTC
From: a3272@mindlink.bc.CA
Message-ID: <m0lysrT-0005GCC@rsoft.rsoft.bc.ca>
Source record: 288354

I got the man from the telephone company out to inspect his Telco set, and
he discovered that my modem(?!) was rectifying the RF and inserting audio
into the phone lines at an ear-splitting level. The way my modem works is
that it plugs into the phone jack, and the phone plugs into the modem.
The interference was equally loud whether the modem was ON or OFF. The
technician suggested that I unplug my modem when using my transmitter or
the modem could generate enough audio to inductively couple into the other
circuits in the apartment building. He threatened to bill me for non-Telco
equipment if he received another complaint to my address. I informed the
DOC, and they wanted the DOC approval number (550 2111 A) on the modem

3745. Casio B.O.S.S. pinouts/signals/protocols?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-20 00:31:12 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <60812@cup.portal.com>
Source record: 288355
Cross-posted to: rec.radio.amateur.misc,sci.electronics

Hi gang.

I recently acquired a Casio "Business Organizer Scheduling System" (BOSS), one of those "electronic DayTimer" type things. One of its more interesting capabilities is a serial communication with other BOSS's through a direct-connect plug-and-plug cable, and to an IBM-PC running appropriate software with yet another cable, this one having some kind of Black Box inline.

The physical connector on the BOSS itself appears to be the same as a "Walkman-type" stereo headphone plug -- what I'd call a "stereo miniature phone plug." That's all I know, but I'd like to be able to write my own PC (and other computer) software to talk to this thing. I assume I need to know which of the BOSS pins carries "receive," "data," and "ground" (not too hard, there are only three conductors), at what levels (also not TOO hard to figure out, with a scope and a captive electrical engineer), but most importantly I will probably need to match THOSE levels to RS232 AND figure out the transmission "protocol" -- i.e., "send THIS sequence to indicate MEMO data on its way," etc. etc. etc...

I'd be really interested in opening a dialog with anyone who has done this, or who has any suggestions as to how I might proceed to work it out for myself. I definitely don't want to spend $100+ for a BOSS-to-PC cable and someone else's software that I can't modify!

palmer@cco.caltech.edu writes
in article <1992Jun17.193326.6382@cco.caltech.edu>:
>
> I am interested in something called a 'Whistler' which is
> a radio-frequency disturbance varies in frequency across the radio
> spectrum with time. [etc]

Lightning generates electromagnetic radiation right across the
spectrum. The audio frequencies travel along lines of force in
the Earth's geomagnetic field, so a thunderstorm in the Northern
Hemisphere will be received in the Southern. High frequencies
travel faster, so the received-pitch goes down with time. The
time between frequencies is related to the length of the path,
and to the electron density (particularly that furthest from
the Earth).

They sound really good, with the sort of spookiness that
whale-song has. Duration is (I think) 1-3 seconds.

It's a long time since I was at a receiving station, but I
think the antenna was a large loop. The loop was located
well away from sources of electrical-noise, on an island
400 miles from the mainland. The actual receiver is simply
an audio amplifier.

I remember an attempt was made to produce artificial whistlers.
Pulses were fed into an uncommissioned length of power line. The
line was on high pylons, and ran 100's of kilometres. The receiving
station was only about 8 degrees of latitiude away, and I don't
think anything was heard. It may well have been received in the
opposite hemisphere though.

References: J.A. Ratcliffe's "Sun, Earth and Radio" (World
University Library, 1970) has a bit. I think there was
an article (late 80's?) in the US magazine Popular Electronics.

3747. Things to See

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-20 03:19:33 UTC
From: edg@netcom.com
Message-ID: <6dmlrs=.edg@netcom.com>
Source record: 288359

On August 1, I'll embark on the "Five Week Cross Country Motorcycle Oddysey (tm)" travelling from the SF Bay Area to the east coast and (hopefully) safely home again.

I'd like any suggestions of what to see while on my route that is related to ham radio.

My route is roughly SF via I80 to Salt Lake City, then via I70 to Denver, then I-70 to St. Louis, then I-64 to Norfolk, then up the East Coast to New Jersey and New York, after a stop at Washington DC. Return is via Upstate New York, Canada (north of Lake Erie), Across Michigan, through Chicago, then west some undetermined route that is north of I-80. I'll wind up in Yellowstone, then into Reno, NV for Labor Day Weekend, and home.

I don't plan to travel those Interstates, I just mention them as a baseline for the approximate states and areas I plan to traverse.

Good roads are also a plus, so if you know of any in my direction of travel, please speak up.

I'd appreciate Email so it's easier to catalog your responses. If you'd like to post here though, I'll get it.

Thanks
-edg

mwilson@crash.cts.com says:

>
> Yes, but there are LOTS of people who cannot use FTP for various
>reasons (I am one, there must be others!).
>

This is not true. Even if you do not have direct access to FTP you can still use FTP. Let me explain. There are special servers out there that accept FTP command files as e-mail and will execute the command file for you. One such site is "ftpmail@decwrl.dec.com".

First you should send an e-mail with only "help" in the body of the message. It will then send you back a list of detailed instructions on how to use it.

One note, for binary files you need to request the server to uuencode it for you before sending it. Then when you receive it you will need to uudecode it back to a binary file. This also means that you will need the executable uudecode. Check and see if you have this command available at your site, if not then let me know and I will see what I can do to get you a copy.

FTP mail servers are a blessing to those who only have e-mail access. And they work pretty good. There is some time delay and it's not as neat as having real FTP access, but it makes a pretty good second.

For more informations look into the FAQ #3 posted in this news group.

Happy FTPing and 73s,
Mont - KD6JJB/AA

=========

MONDAY JUNE 22, 1992

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* MORE HAMS AT NASA *
====================
Three more NASA astronauts have passed their technician
examinations. All three took the test at the Ham Com convention in
Houston the weekend of June 6, and are scheduled to join pilot Ken
Cameron, KB5AWP, on a shuttle mission in March 1993.

The three new ham-astronauts are Ellen Ochoa, Mike Foale, and Ken
Cockrell. Foale is reported to have bought a 2-meter rig at the
convention and is gnashing his teeth waiting for his ticket to
arrive.

Cameron last flew on STS-37 in April 1991, a Shuttle Amateur Radio
EXperiment flight reported in QST for July, 1991, pages 14-15.

[Info via ARRL Headquarters]

* MIR NEWS *
============
In packet radio messages to Dave Larson, N6JLH, Mir cosmonaut Alex, U8MIR
is reporting that an EVA has been scheduled for July. The cosmonauts are
having some trouble with Mir's attitude control system at the present time,
and this is having an impact on their geophysical and astrophysical
research experiments. Mir is rotating like a free body with a period of
0.15 to 0.20 degrees per second.

In the meantime, the cosmonauts are keeping busy conducting technical and
medical experiments and making small repairs within the space station.

[Info via Dave, N6JLH]

* FO-20 NEWS *
==============
A software reload was completed on 16-Jun-92 at 04:55 UTC by FO-20

spacecraft controllers.

The FO-20 operation schedule is as follows:

June 16th to 23rd: Fast Telemetry Transmission
Mailbox is closed
Digital repeater available

June 23rd : Mailbox will be re-activated

Mode JA analog transponder operation is expected to occur according to the following schedule:

24-Jun-92 01:50 UTC -to- 25-Jun-92 02:10 UTC
27-Jun-92 02:50 UTC -to- 29-Jun-92 01:35 UTC

[Info via Kazu Sakamoto, JJ1WTK]

* TELECONFERENCE UPDATE *
==========
Arthur C. Clarke, AMSAT member # 2001, and the man whose imaginative mind conceived communications satellites decades before the first such machine was built and placed into orbit will be a special guest on an upcoming National Teleconference Radio Net scheduled for 6 - 8 PM Eastern Daylight time on July 12. AMSAT-N.A.'s Director of Development Joe Schroeder, W9JUV, has announced that the futurist and writer has accepted an invitation to appear with other AMSAT notables on this "town meeting of the air" of 1992 that is being devoted to space relay communications.

The July NTRN will be a plain language discussion of communications satellites in general and the planned AMSAT Phase IIID in particular. Technical talk will be kept to a minimum, with emphasis placed on the utilization of these birds by the amateur community worldwide in a wide variety of situations including emergency communications, education, information dissemination and just plain rag chewing.

Other guests expected to be on-line include Schroeder, former Astronaut Tony England W0ORE, AMSAT-NA President Bill Tynan, W3XO, Executive V.P. Ray Soifer W2RS, Phase IIID Projct Manager Dick Daniels W4PUJ and Education Director Rich Ensign N8IWJ. Former NBC Network News science editor, correspondent and producer Roy Neal K6DUE will moderate the program. Both Clarke and net participant Astronaut and Antarctic explorer Tony England, W0ORE are appearing on the invitation of K6DUE. Pre-net audio again supplied by Steve Bauer, KC0HF.

A major topic to be discussed during the two hour session will be the new Phase IIID Amateur Radio satellite, currently in its final design stage by AMSAT groups worldwide. Phase IIID has been dubbed "the first ham satellite for he average amateur" and is a very ambitious and costly project for AMSAT. Phase IIID will cost a bit over five million dollars to construct and launch, with hams in North America expected to donate at least $1.5 million of that amount before

the anticipated 1995 orbiting of the new bird. Once in orbit, Phase IIID will use its highly directional high-gain antennas an multiple transponder array to provide almost unprecedented high-quality space relay communications for he worlds radio amateurs. Exactly how this will be accomplished will be explained during the NTRN session.

* JERS-1 INFO *
==========
JERS-1 Information No. 12

June 5, 1992 (14:00)
MITI/NASDA HQ., Tokyo Japan

INITIAL FUNCTIONAL VERIFICATION TEST COMPLETED

The Japanese Earth Resources Satellite (JERS-1/Fuyo-1)'s initial functional verification tests of the onboard equipments were completed on May 31. As a result, the regular operation of the satellite, such as observing the Earth with the onboard-mission instruments, started on June 1, 1992.

The JERS-1 was launched on February 11, 1992, by the National Space Development Agency of Japan (NASDA) from its Tanegashima Space Center.

The initial functional verification tests of the bus equipments and the optical sensors (OPS) were carried out in February and March, respectively. Also, the tests related to the Synthetic Aperture Radar (SAR) were conducted after its antenna deployed on April 4, 1992. The results of the above tests were satisfactory.

NASDA is going to conduct the interface verification tests between the mission instruments and the ground-facilities for the next approximately three months while hoping to start the data distribution to the users as soon as possible.

JERS-1 is a joint development program between NASDA and the Ministry of International Trade and Industry (MITI). NASDA developed the satellite bus while MITI undertook the mission instruments development.

I've never tried bleach bottles, what brand do you recomend? I agree that the white PVC pipe weathers badly, but the blue stuff (hey, I'm no plumber) works fine. I use barbed 1/2 inch tees for center insulators and they stay up for years.

>Amateur centered around page 204 is an article that was (I think) an SSB
>rig for 80 and 40 with a 9MHz SSB IF (I was interested only in the transmit
>mixer, so I didn't read the rest of the text :-); QST ran a 14MHz SSB
>transceiver design that I think made it into QRP Classics.

I thought to myself that of course the Handbook would have one, but
after paging through the 92 edition all I found was a partial circuit
in the theory section, nothing but CW in the project section. By the way,
a better index for the new handbooks would be appreciated.

Falling back to the 1963 handbook I found two designs, filter and
phasing. Tube type of course. I started checking other years, and
found what you want in the 1986 Handbook on page 30-30. A 9 MHz SSB
generator module, complete with a circuit board available from Circuit
Board Specialists. It looks like a simple design made from parts still
commonly available. The speech amp is a 741, carrier oscillator is a
MPF102 followed by a 2N2222 buffer, the mixer is an active FET design
using a pair of 40673s, and another 2N2222 couples the mixer to the
crystal filter. Missing is a post amp for the filter.

This circuit could stand considerable updating. I expect there are
single chip circuits available today that could replace the messy
discretes. Personally I just scavenge the SSB section out of old
CB sets.

>thousand in 1965 but not in the 1975 market with 260 thousand?

Perhaps because the numbers *did* stay around 260,000 for ten years
after IL. There weren't enough newcomers to buy their dated designs.
There wasn't much innovation in American ham gear during this period
so there wasn't much incentive for existing amateurs to get new rigs.

Note that the Japanese sneaked into the market initially via VHF FM
rigs, something the old line American manufacturers never did well.
The low *caste* amateurs entering under IL didn't have the HF phone
priviledges once granted to all. Many stayed on VHF where they
bought Japanese equipment. That gave the Japanese a name recognition
foothold that eventually translated to HF sales against the declining
old line American brands.

>>The reason the Japanese

>than in Japan. Obviously there are factors at work here other than IL!

Certainly the Japanese were attempting to take over the consumer markets
in the US, and they've succeeded remarkably well. They used predatory
pricing and dumping to gain market share. The US amateur market has never
been large like the TV and stereo markets, and the margin on amateur
equipment is small. The tactics used to gain share in the large consumer
markets aren't cost effective in the comparatively tiny amateur market.
Instead they came in by the back door and filled a vaccum as it appeared.

>>The late 1960s did see a substantial portion of the potential amateur

>played a part, as did other economic and social factors. Attributing
>everything bad that happened in ham radio from 1967 to 1980 to IL is
>just unsupportable.

While I haven't done a scientific study, I did live through that period as an amateur. All I can go on is my own experience and that of others I've talked to then and now about the subject. I am convinced that IL was *the* factor *in* amateur radio that contributed to the stagnation of amateur radio during that period. I haven't contended that it was the *only* factor, just the one *directly* connected to amateur radio. I'm sure external factors played a role, but they are outside our control. The ARRL brought IL on itself, and US amateur radio, without any outside aid.

I've quit trying to visit the sins of the fathers on the current ARRL organization, but I'm always ready to *remind* people of the kinds of effects that elitest regulation can have. It could happen again if we aren't vigilent. Not in the same form, but in the same way. For example the League is still fighting a rear guard action with respect to legally mandated band plans that hold back amateur radio from flexibly managing it's spectrum as communications technology changes. I lobby hard to break down the barriers emplaced to separate radio amateurs into castes based on arbitrary criteria like CW speed for more voice spectrum. I note with some pride that things are slowly beginning to turn around and that I've played a small part in that.

Gell cells are lead acid batteries, not Nicads. They should be charged with a constant *voltage* charger, not a constant *current* charger.

3755. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-20 15:15:14 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Jun20.151514.10696@afit.af.mil>
Source record: 288046

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

3756. RACES Bulletin #227

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-20 19:28:23 UTC
From: enge@almaden.ibm.com
Message-ID: <9206201927.AA01742@ucsd.edu>
Source record: 288229

Msgid: $RACESBUL.227

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.227 DATE: June 22, 1992
SUBJECT: MGT: Activation of a RACES unit. Part 3/3

- Hazardous material spill or incident.
- Rainfall/stream level observation and reports during a storm.
Severe weather observations and reports. (Prior training from the
National Weather Service is required.)
- ATV (Amateur Television) from the National Weather Service
forecast office to the EOC for periodic briefings during severe
weather incidents.
- Hostage situation. (ATV transmits high resolution color pic-
tures back to the EOC or law enforcement HQ for training pur-
poses.)
- Forest and wild fires.
- Floods.
- Point-to-point links during telephone outages.
- Interstate mutual aid missions: forest fires, etc.
- Landslides with long detours in remote areas: provide phone
patches for the inconvenienced motorists.

Almost any activity conceivable to the Radio Officer can be justified
to train the RACES members if the situation is approached and handled
in the right manner. Studied carefully and prudently, almost any
activity can be one in which a RACES unit can function, although
it takes effort by the RO and close coordination with the Emer-
gency Services Manager for the RACES unit in your jurisdiction.
Essentially, it depends on how it is handled and structured. For
helpful details, refer to Bulletins-By-Topic, print version
[available from State OES, Sacramento at cost; $10 check payable
to the State of California includes mailing expense.]
EOM

RACES Bulletins are archived on the Internet at ucsd.edu in hamradio/races
and can be retrieved using FTP.

3757. RTTY DX Notes for week ending 19 June, 1992 (BID RTDX0619)

RTTY DX Notes 19 June
RTTY DX Notes for week ending 19 June, 1992 (BID RTDX0619)

Due to family commitments, I will not be producing the DX notes for
the next two weeks. That is the weekend 26 June and the weekend of 03
July. I am happy to say that our dear friend Luciano I5FLN, has
agreed to accept the responsibility to produce these notes for those
2 weeks. I thank him from the bottom of my heart for his efforts in
the past and we hope in the future. So please direct your DX
information to Luciano for this period. We thank you in anticipation.
I am sure that he will do his usual excellent job.

Our thanks this week go to CE3GDN, I5FLN, N4JVP, TG9VT, UT5RP, VK2EG,
VK5QD, W2JGR and the Twin-Cities DX Packet cluster network and W2CJL.
We thank you all for your assistance, and please for the next two
weeks send your information Luciano I5FLN. I am sure that he will
appreciate it.

Notes of interest.

VP8CBK (South Georgia) Keith reports that he has been listening on 14 MHz Sundays and Tuesdays with very little results. So now he is going to listen on 21085 Khz and 28085 Khz Sundays and Tuesdays between 1500z and 1700z. But do not panic, Keith will be there until April, 1994.

D2ACA (Angola) cards. Dima UT5RP reports that RT5UY is the QSL manager for this operation and guarantees 100% QSL for all cards received. His address is N.K. Usoltsev, Box 73, Kiev-79 242209 Ukraine Republic (DO NOT USE THE WORD RUSSIA).

Dame rumor has it that there will be operation from ZL8 during November, but by whom or exactly when is not known. The same rumor says that A35 should be on the air around the same time.

Don't forget that ALL information for these DX notes goes to Luciano, I5FLN @ I5FLN.ITA.EU for the next two weeks. Thank you.

GL DE DX1 (VK2SG)

Normally forward RTTY DX news tips to VK2SG @ VK2AGE.NSW.AUS.OC, but for the next two weeks the info goes to I5FLN @ I5FLN.ITA.EU.
/EX

If you get lucky, like I did, you can pick up a set for $200. A T-4XC, R-4C, MS/AC-4, and a C-4 went begging on the Honolulu Swap net for months because (apparently) no one knew what they were...

Of course, they're now sitting, along with most of the rest of my worldly possessions, in large crates in a warehouse here in Dayton...

(that's right, I'm back on the net, sporting a new address, significantly more computing power, but no time to use it ;-( )

Re Incentive licensing:

>Hey, while IL TOOK EFFECT in 1967, it was ANNOUNCED by the FCC
>in 1966 and PROPOSED BY THE ARRL!!! (not by Wayne Green or CQ) in 1964.

It is worth mentioning that what ARRL originally proposed bore little
or no resemblance to the complicated sub-band system the FCC eventually
came up with. As I recall, ARRL's idea was simply to re-instate the
old Advanced class license where two of the HF phone bands were
Advanced only.

I'd be interested in a mailing list.

While we are talking about the IC-735, I'm starting to have a funny problem with mine. The power relay seems to be getting sticky. It takes anywhere from 30 to 90 seconds for it to pull in after I push the POWER switch. Anyone else have this problem? Is there anything I can do short of replacing the relay?

Thanks, Dan KB6NU

SB NEWS @ AMSAT < KD2BD $NASDA1
LE-7 Engine Trouble Seen

From NASDA PRESS RELEASE:
June 18, 1992
NASDA Tokyo Japan

LE-7 Engine Trouble Seen
---

1. History

The National Space Development agency of Japan (NASDA) has been conducting a series of engine firing tests using the engine Qualification Test Model EG304 in the Tanegashima space Center.

On June 2, 1992, NASDA conducted a 20-second engine firing test, and also carried out a 365-second engine firing test both on June 5 and 10, 1992. Their results were successful.

On June 18, NASDA conducted a 10-second firing test following after the liquid hydrogen turbopump exchange.

2. Test Date & Time:

Ignited at 17:32, June 18, 1992

3. Trouble Observed:

Fire was seen outside of the engine at 5 seconds after the 10-second firing test started. However, the fire was soon extinguished.

4. Present Status:

It is under investigation.

5. Others:

The next news on this engine trouble will be released by NASDA in the afternoon of June 19, 1992, (Friday).

/EX
SB NEWS @ AMSAT < KD2BD $NASDA2
LE-7 Engine Trouble (Second Info)

From NASDA PRESS RELEASE:
June 19, 1992
NASDA Tokyo Japan

LE-7 Engine Trouble (Second Information)
---

1. Outline:

NASDA conducted an H-II LE-7 engine firing test whose using EG304 on June 18, 1992.

Although the engine was ignited at 17:32, June 18, the following phenomena were observed:

(1) The fire was suddenly seen outside of the whole engine at 5 seconds after the 10-second firing test started.
(2) However, the fire was extinguished after one minute since the fire started.
(3) It, however, has been confirmed that the measurement data, such as, pressure, temperature, quantity of flow, a number of revolution, vibration, etc. during the above five-second firing time were normal.

2. Status of Engine and Facilities:

(1) LE-7 Engine

The engine was cut off at the gimbal (interface part between the engine and the facilities), and dropped down from the test stand.

The engine model was dropped into the pool of cooling water located in the lower part of the facilities (the depth is 23 m from the ground). NASDA has been trying to retrieve the model. Moreover, a part of the engine model was left on the stand ground.

(2) Test Facilities

It seems that no damage has been seen over the test stand structure. No pipe damage observed since the high pressure gas system facility was covered with heat-resistant tape. No functional problem viewed over the valves even though a small amount of the dissolved materials attached over them. However, the cables for measurement and small pipes have been damaged. Coating of the measuring equipment came off.
The functional status of the other equipment are under investigation.

NASDA has been investigating to find out the cause of the fire this time.
We will issue a press release soon after we will have found the cause.

NASDA-DARA First Conference Results

From NASDA PRESS RELEASE:
June 18, 1992
NASDA Tokyo Japan

NASDA-DARA First Conference Results

NASDA and the German Space Agency (DARA: Deutschen Agentur fur Raumfahrtangele-genheiten GmbH) had the first conference between June 15 and 16, 1992, in

Berlin, Germany.

The conference was led by both Mr. Matsui, the NASDA Vice-President, and Prof. Dr. Wild, the DARA Director-General, who played a role of chairman at each side.

In addition to general discussions on mutual cooperation, the member of both delegations talked about earth observation, space experiments, and the future plans.

As a result, the participants between the two countries agreed to start detailed examination from now onward on the following fields considered having a possibility of cooperation:

(1) Earth observation data exchange, and the future earth observation satellite plan

(2) Interexchange of microgravity experiment research, and the future manned plan

(3) R & D information exchange of space robots, etc.

The second conference will be held in Tokyo during the next year. A theme, "safety and quality assurance" will be added to the agenda from the next time.

3764. Fun 25WPM code practice

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-21 06:00:12 UTC
From: tonyp@convex.com
Message-ID: <1992Jun21.060012.17804@convex.com>
Source record: 288236

I copy the following station nightly. They send CW around 25 WPM
for 15 to 30 minutes. The text is clear but abbreviated and consists
of weather reports for the Northwest Pacific. It is QRR (automatic
or computer generated). When the "guys" send by hand, well, I think
one of them broke/lost the straight key, and are either using a toggle
switch, or maybe touching 2 bare ends of a wire together... then again,
it could be Japanese Katakana code*.

CKN / 12.753MHZ / 0530-0545,0600 / 25WPM / WX

If anyone wants other frequencies I can supply them.

* QV: ARRL publication, circa 1968, "Bill Novice".

>need any of that stuff to think, right :-) :-)

Actually, it would be possible to modify our old beta RF boards to directly produce 144 MHz output. These boards can be identified by the coax phasing line. If the 1496s were replaced with SBL-1 mixers, the phasing line shortened, and a post amp added (MMIC), it should work fine.

That's still not a general solution. The reason 28 MHz was chosen in the first place was that there were several transverters available at the time to carry the signal to the band of choice. Unfortunately most of these sources have dried up since the design was finalized. Using transverters is still the way to go because of the modularity it promotes, but somebody needs to get busy and start producing them again.

Microcomputers certainly took their toll *later*, but there's still a
ten year gap between the onset of IL and the wide availability of home
computers.

>It wasn't until four or five years ago that we got to the point of
>bringing the two hobbies back together. And only with the No-Code
>license was it done properly.

Absolutely! It's the best thing to happen, regulatorially, to amateur
radio in 22 years. Well done QCWA, well done KA9Q, and well done to
a bunch of other people. We're back on track now and the numbers prove it.
We're even getting new CW addicts out of this crowd as they mix with
current hams and catch the DX disease.

>and the stars (but with roofing nails, I hope!!) and
>(2) a dipole in the great outdoors at the same height?

There are two deficits to attic antennas. When the roof is wet, attenuation will be greater than for an antenna outside. Dry wood is relatively lossless at HF. The second problem can be more serious. Since house power wiring normally is routed through the attic, you get a lot more coupling between the antenna and your AC system. This can lead to increased RFI and to degradation of the antenna's output and pattern.

It's still better than no antenna at all. What you should do to get your neighbors used to the idea that they live next to a ham though is to get a RS push up mast and install it fully collapsed. Putter around it ostentatiously with a watering can. Slip out at night and push it up a few inches each week. Soon your neighbors will become accustomed to the metal tree growing in your yard and you can start to add branches and leaves. :-)

I used a different approach. My tower arrived via motor freight the day after a neighbor's house was struck by lightning. I told the neighbors that I was installing a community lightning rod and they all pitched in to help. It didn't hurt that I had to get rid of the rusting Chevy that was up on blocks where I wanted to put the tower. Even the neighbors' wives like the tower better than the old car. I thought it added a certain touch of rural Southern charm to the house. :-)

There are (or used to be) amateur radio stations in the Maryland Science Center and the Franklin Institute (Philadelphia). Theres also the ARRL headquarters, and the Marconi site on Cape Cod. You could also stop at TenTec in Tennesee (Sevierville?).

US 6 through the Rockies is parallel to and more scenic than I-70, however they become one at a couple of points. However US-6 goes via Loveland Pass (over) rather than the Eisenhower tunnel (through) the divide.

Source record: 288242

Hey Folks,

I am interested in purchasing an HT with 2m and 70cm. I have looked at the Alinco DJ-580T and the Kenwood TH-77A as my finalists. They are $399 and $479 respectively. Can you offer me some pro's and con's please why I should by one of these radios? Any other suggestions?

Sorry if this is an already covered discussion but I am pretty new to this group and haven't seen it come up yet. If there are some summaries from previous discussions, I'd be happy to read them. I'll also summarize if I get enough response.

Thanks for the help,

Charles

3773. AM rigs: info wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-21 17:26:18 UTC
From: wmc@phx.mcd.mot.com
Message-ID: <1992Jun21.172618.26326@phx.mcd.mot.com>
Source record: 288243

Back when 10 meters used to open, I enjoyed listening to some
of the "new AMers". Some of these guys had broadcast quality
audio!

Anyway, I decided I'd like to start looking for an AM rig so I
can join them when 10 comes out of its summer doldrums.

I'd like to hear suggestions/opinions on AM transmitters that
are likely to be found at swap meets. Plate modulated rigs would
be my first choice, but I'm open-minded at this point. What models
should I be looking for?

Thanks in advance for any info. (And I'll be happy to summarize
for the net if anybody else is interested.)

3774. T/R relays still made?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-21 17:31:13 UTC
From: wmc@phx.mcd.mot.com
Message-ID: <1992Jun21.173113.26395@phx.mcd.mot.com>
Source record: 288244

I'm thinking about putting together an "old-fashioned" type station, and one of the items I'll need is a T/R relay.

Is Dow-Key still in business? I'd really like to obtain a NEW relay if possible, since the flea-market types all seem to be WELL worn. I know I can just get any old relay and put it in a box with connectors, but the "all one piece" relay seems like a better way to go. Besides, I'm lazy!

3775. SUMMARY: Line Voltage Cooling Thermostats (keep my rigs cool!)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-21 19:14:29 UTC
From: peterson@crash.cts.com
Message-ID: <1992Jun21.191429.14097@crash.cts.com>
Source record: 288250

Here is a summary of reponses to my posting on what is available in the way of AC line voltage cooling thermostats, (preferably packaged like a 24 hour security timer). Thanks again to all who responded!

I didn't get any responses that mentioned thermostats already packaged exactly the way I had envisioned, so I ended up building my own. I received info on three different line voltage thermostats, summarized below. I bought one by Dayton Electric intended for mounting in a standard electrical box and mounted it externally over an appropriately sized project box. I added an AC line cord and outlet, fuse holder, and a small neon lamp. I plug a couple of 4" AC muffin fans into the outlet that I strategically place near my gear. I like the fact that the muffin fans are pretty quiet. Of course, if noise doesn't bother you, buying a box fan with a thermostatic control built in (readily available) certainly works just as well.

Summary of line voltage thermostats:

Description: Temperature switch
Manufacturer: Hoffman
Catalog #: D-TEMA
Volts: 120/240
Amps: 12.5/8.0
Range: 70 to 140 deg F +/-3 deg
Cost: approx. $25
Availability: (try local electrical supplier)

Description: Line Voltage Thermostat with SPDT switch (heating or cooling)
Manufacturer: Dayton Electric
Catalog #: 2E158A
Volts: 120/250
Amps: 22 Amps at 120V
Range: 50 to 90 F
Cost: $16.17
Availability: W.W. Grainger (Item 2E158)

Description: Digital Thermometer/Controller
(note: 1.5V power and relay required for 120V applications)
Catalog #: 277-123
Cost: $19.95
Availability: Radio Shack

----- original posting -----
From: peterson@crash.cts.com (John Peterson)

I'm looking for a simple, general purpose, line voltage *cooling* thermo-
stat. Basically, I'm getting my equipment together for a packet base station,

and it would be nice to have some extra fans kick in, should the room start
to warm up. Has anybody seen a *cooling* thermostat packaged similar to those
24 hour security timers (what I'm using now!), that you can plug your fan of
choice into. I've looked around quite a bit, found a similar gadget for
heating applications, but nothin' for cooling. I would think this is of
general interest, so respond by e-mail, I *will* post a summary.

From: carndt@nike.calpoly.edu

Hoffman Engineering makes several lines of electrical equipment
cabinets and accessories. One of the accessories is a thermostat
such as you describe. (I use 'em at work, so I can vouch for them.)

Hoffman stuff is available from electrical wholesalers. They can get you
a catalog. If you need more info from me (I can get you part # and approx
cost) Email me back. I'm at home and the info is at work.

73

Chris KD6DSI carndt@pan.calpoly.edu

From: mark@ve6mgs.ampr.ab.ca

Honeywell makes a line that works for us. We purchase the thermostats
at a local Electronic Parts Supply House (Cardinal Industrial Elec.).

We use a cooling thermostat to trip in the fans, then a heating thermostat
to cut off power to the electronics when the temperature rise gets out
of hand (some roadside cabinets just can not be cooled :-).

I would recommend looking in your Electronic Component section of the
Yellow Pages, followed by Heating/Cooling manufacturers and distributors.

Ciao, 73 de VE6MGS/Mark -sk-

> choice into ...

John,
A thermostat that would prevent overheating usually is not found as
part of a home-improvement idea. Most thermostats, if not all, are to
prevent underheating. The options you have, as I see them are:

1) Obtain a heating/cooling thermostat. Most of these operate in the
30 volt range, and you can use a spare 24-30v relay to operate your
fan(s). The heating portion would not be used.

2) Obtain a thermostat, schmitt trigger, FET, and relay, and build your
own. This is about the only way to get a small, reliable unit, which
could then be fitted into a plug-in type unit of your choice.

3) Obtain a heating thermostat and power a relay with it. When your
equipment gets too hot, the thermostat shuts off, CLOSING the relay
contacts and powering the fans.

4) Radio Shack offers a panel-mount digital thermometer which can be
configured as a thermal-controlled switch. I don't remember the price of
this unit, but if your station ends up in a luggable box, this might be a
nice addition to your array of panel meters. It is apparently able to
close a contact (unknown specs) at whatever temperature you designate,
and should be selecatable for cooling or heating.

Just my $1.50 worth of $.02 gathering dust.

Hoffman
Description: Temperature switch
Catalog #: D-TEMA
Volts: 120/240
Amps: 12.5/8.0
Range: 70 to 140 deg F +/-3 deg
Cost: approx. $25

From: bat@gdstech.grumman.com

I needed a cooling thermostat some years ago, and went looking thru
jusk boxes. All I could find was heating thermostats. One was the
standard mercury tube type on a bimetal strip. I removed the tube,
and put it back in its holder backwards. Now, when the ambient temp
went down, the bimetal moved, and the mercury dropped onto its
contact electrodes. The fan then came on. You can also do this
with any bimetal strip with built-in electrode. Just remove from
holder, reverse it, and mount it on a piece of wood if necessary.

3776. RFI problems with Infrared Motion Detector Security Light

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-21 19:37:18 UTC
From: peterson@crash.cts.com
Message-ID: <1992Jun21.193718.14807@crash.cts.com>
Source record: 288249

The summary pretty much says it all: I have one of those Infrared Motion Detector Security lights installed outside, and ever since I set up my 2m base station antenna, the light kicks on (after dark of course) when I transmit. :-(

The unit is an Intelectron model BC 870K that has a plastic housing, so its obviously not too well shielded. Giving consideration to the possibility that volatge spikes were coming in over the AC line I tried several experiments with ferrite chokes. I even pulled the unit off the electrical box, spliced on some extra wire and wrapped it a jillion times around one of those rectangular chokes. Didn't help. :-(So, RFI over the AC line probably isn't the cause.

Anybody had this problem, and tracked it down? Replacing the Motion Detector with one that is better shielded is certainly an option (probably my only one!)

3777. Looking for a good dual bander

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-21 19:57:33 UTC
From: dem@meaddata.com
Message-ID: <1992Jun21.195733.7804@meaddata.com>
Source record: 288251

I'm looking for a good 144 and 440 dual bander to use as a base radio. I'd appreciate any comments or criticisms of the Kenwood 741 and 732, the Alinco 599, the Icom 2410, and 3230, or any other radio you have experience with. Particular features I'm interested in are simultaneous receiving on each band (I think all of these radios do this), simultaneous frequency display for each band (ditto), and lots of memories that can be used for simultaneous scanning on each band. Also, since I already have a dual band antenna up, it would be helpful to know whether these radios have separate outputs for each band and that I'd need some sort of adapter to use them with my existing antenna. Your responses via E-mail will be greatly appreciated! Thanks!

My point was that it seems to do what I assume it's intended to do--act as
an incentive. And not just for me. I know it's provided an incentive for
a number of my students to learn more about radio and to improve their
code speed. And I think that's a good thing.

STS-50 Shuttle Amateur Radio Experiment (SAREX) From NASA Press Kit

The Shuttle Amateur Radio Experiment (SAREX) is designed to demonstrate the feasibility of amateur shortwave radio contacts between the Space Shuttle and ground amateur radio operators. SAREX also serves as an educational opportunity for schools around the world to learn about space firsthand by speaking directly to astronauts aboard the Shuttle via ham radio.

Contacts with certain schools are included in planning the mission.

Ham operators may communicate with the Shuttle using VHF FM voice transmissions, slow scan television and digital packet. Several selected ground stations also will be able to send standard television to the crew via SAREX. The television uplink will be used to send video of the crew's families and of the launch.

The primary voice frequencies to be used during STS-50 are 145.55 MHz for transmissions from the spacecraft to the ground and 144.95 MHz for transmissions from the ground to the spacecraft. Digital packet and slow scan television (SSTV) will operate on the same frequencies, while the fast scan television (FSTV) uplink will be limited to the UHF ham band at 450 MHz.

Equipment aboard Columbia will include a low-power, hand-held FM transceiver, spare batteries, headset, an antenna custom designed by NASA to fit in an orbiter window, interface module and an equipment cabinet.

SAREX has flown previously on Shuttle missions STS-9, STS-51F, STS-35, STS-37 and STS-45. SAREX is a joint effort by NASA, the American Radio Relay League (ARRL), the Amateur Radio Satellite Corp. (AMSAT) and the Johnson Space Center Amateur Radio Club. Information about orbital elements, contact times, frequencies and crew operating times will be available from these groups during the mission and from amateur radio clubs at other NASA centers.

Ham operators from the JSC club will be operating on HF frequencies and the ARRL (W1AW) will include SAREX information in its regular HF voice and teletype bulletins. The Goddard Space Flight Center Amateur Radio Club (GARC) in Greenbelt, Md., will operate 24 hours a day during the mission, providing information on SAREX and retransmitting live Shuttle air-to-ground communications. In addition, the NASA Public Affairs Office at the Johnson Space Center will have a SAREX information desk during the mission.

STS-50 SAREX Operating Frequencies

Location Shuttle Transmission Shuttle
Reception

U.S., Africa 145.55 MHz 144.97 MHz
South America 145.55 144.95
and Asia 145.55 144.91

Europe 145.55 MHz 144.80 MHz
145.55 144.75
145.55 144.70

Goddard Amateur Radio Club Operations
(WA3NAN SAREX Information and Shuttle Audio Broadcasts)

3.860 MHz 7.185 MHz
14.295 MHz 21.395 MHz
28.650 MHz 147.450 MHz (DC/Baltimore)

SAREX information also may be obtained from the Johnson Space Center computer bulletin board (JSC BBS), 8-N-1 1200 baud, at (713) 483-2500 and then type 62511.

SILVER SPRING, MD JUNE 20, 1992 BID:$ANS-172.03
TO ALL RADIO AMATEURS BT

SATELLITE NTRN TO FEATURE ARTHUR C. CLARKE
By Bill Pasternak, WA6ITF
Amateur Radio Newsline

Arthur C. Clarke, AMSAT member #2001, and the man whose imaginative mind conceived communications satellites decades before the first such machine was built and placed into orbit will be a special guest on an upcoming National Teleconference Radio Net (NTRN) scheduled for 6-8 PM Eastern Daylight Time on July 12. AMSAT-NA's Director of Development Joe Schroeder, W9JUV, has announce that the futurist and writer has accepted an invitation to appear with other AMSAT notables on this 'town meeting of the air' of 1992 that is being devoted to space relay communications.

The July NTRN will be a plain language discussion of communications satellites in general and the planned AMSAT Phase-3D in particular. Technical talk will be kept to a minimum, with emphasis placed on the utilization of these birds by the amateur community worldwide in a wide variety of situations including emergency communications, education, information dissemination and just plain rag chewing.

Other guests expected to be on-line include Schroeder, former Astronaut Tony England (W0ORE), AMSAT-NA President Bill Tynan (W3XO), Executive V.P. Ray Soifir W2RS, Phase-3D Projct Manager Dick Daniels (W4PUJ) and Education Director Rich Ensign (N8IWJ). Former NBC Network News science editor, correspondent and producer Roy Neal (K6DUE) will moderate the program. Both Clarke and net participant Astronaut and Antarctic explorer Tony England (W0ORE) are appearing on the invitation of K6DUE. Pre-net audio again supplied by Steve Bauer (KC0HF).

By way of background, Arthur C. Clarke was born in Minehead, England in 1917. He is probably best known as the author of the time-travel science fiction novel '2001 - A Space Odyssey' which in turn was based on an earlier Clarke short story titled 'The Sentinel.' '2001' was later made into a motion picture by Director Stanley Kubrick, and was the first of a trilogy of Clarke works that includes '2010 - Odyssy Two' and '2061 - The Year We Made Contact.' Other books by Clarke include 'Earthlight', 'Rendezvous With Rama', 'Imperial Earth', 'The Fountains of Paradise, and 'The Songs of Distant Earth', and many others.

Arthur C. Clarke has also been honored by the science community by having the Clarke Belt named after him. The Clarke Belt, is the "Parking Orbit" for geostationary earth satellites located about 22,000 miles above the Equator.

In one of his early works, Clarke laid out the basic tenants that needed to be included in space relay communications, and went on to illustrate the way in which such man made satellites could serve the communications needs of its creator.

Clarke, who now lives in Sri Lanka, accepted the invitation to take part in the NTRN after a brief telephone conversation with Schroeder on Thursday, June 4th. According to Schroeder, he was attempting to FAX the letter of invitation to Clarke when the phone was answered by voice. Joe explained the reason for the call and in seconds Arthur C. Clarke was on-line and accepted the AMSAT-NA invitation. He also told W9JUV that he could not stay on the telephone very long, because a monsoon with gale force winds was raging outside and this particular phone line was his only connection to the outside world!

During the NTRN, Clarke is expected to explain how he first thought up the idea of communications satellites.

Another famous guest will be Dr. Anthony England (W0ORE). Tony attained great notoriety as the first radio amateur to operate on-orbit, and the first to successfully operate two-way amateur slow-scan television (SSTV) transmissions from a space shuttle. His 1985 flight aboard the shuttle Challenger proved the viability of two-way spaceborne SSTV as a method of transferring mass quantities of data to and from an orbiting shuttle, and led to further official experimentation in this mode by NASA and radio amateurs allied to the space transportation shuttle system. England's STS-51F flight was also where the term "SAREX" which stands for Shuttle Amateur Radio Experiment came into being. Tony left the shuttle program several years ago to become a Professor at the University of Michigan at Ann Arbor, but remains active in Amateur Radio and scientific projects allied to the service.

A major topic to be discussed during the two hour session will be the new Phase-3D Amateur Radio satellite, currently in its final design stage by AMSAT groups worldwide. Phase-3D has been dubbed "the first ham satellite for the average amateur" and is a very ambitious and costly project for AMSAT. Phase-3D will cost a bit over five million dollars to construct and launch, with hams in North America expected to donate at least $1.5M of that amount before the anticipated 1995 orbiting of the new bird. Once in orbit, Phase-3D will use its highly directional high-gain antennas and multiple transponder array to provide almost unprecedented high-quality space relay communications for the world's radio amateurs. Exactly how this will be accomplished will be explained during the NTRN session.

As in the past, the Darome Connection Inc. will be making available its Minneapolis based multi-port interactive teleconference bridge, and John Desmond K0TG, will be on-site to oversee its operation.

The Teleconference itself will originate from numerous cities around the country and will include taped reports by key AMSAT Phase-3D personnel in various countries involved in the satellite project. The interactive nature of the teleconference bridge network permits listeners to become active participants by asking questions of the panelists and receiving answers in real time.

In addition to the 200 interactive ports on the Darome Connection teleconference bridge, AMSAT-NA is also joining forces with the 'Lets Talk Radio Network.' The 'Lets Talk Radio Network' has been purchased by a consortium of hams headed by Blair Alpert (KA9SEQ) and Frank Collins (N6TAF) and will be carrying the entire NTRN as a one-way non-interactive program for those repeaters who wish to listen only and not interact with the guests. The NTRN will be heard over the regular Lets Talk Radio transponder 21 (6.2 MHz Wideband Audio) on the GTE Spacenet III communications satellite.

The Amateur Radio Newsline Inc. of Los Angeles California is overall producer of the NTRN for AMSAT-NA and will be providing both technical and creative services for the event. Bill Pasternak (WA6ITF) is serving as Executive Producer and Director.

Due to the limited number of interactive ports on the teleconference bridge, these will only be made available to repeater groups wishing to actively participate in a two-way exchange with the guest panelists and will be assigned on a first-come, first serve basis. To reserve a teleconference bridge interactive port, please send a self addressed postal card and a letter of request that gives the repeater callsign, its location, name address, callsign and telephone number of its trustee/licensee and its estimated user base (number of users likely to take part in the NTRN) to the 1992 Satellite NTRN, % Newsline Radio, 28197 Robin Avenue, Saugus CA 91350. Alternately, port assignments may be requested by MCI Electronic Mail sent to the 'NEWSLINE' mailbox on that service. The cut off date for reservations is June 30, 1992. (Note: No reservations can be accepted on any other E-Mail service, and requests by mail that are not accompanied by a self addressed stamped postal card will not be answered. No requests will be accepted or assignments made by telephone.)

NOMINATIONS FOR AMSAT-NA BOD CLOSE

HR AMSAT NEWS SERVICE BULLETIN 172.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 20, 1992 BID:$ANS-172.04
TO ALL RADIO AMATEURS BT

Candidates For The AMSAT-NA Board-of-Directors (BOD)

The following AMSAT-NA members have been nominated to run for the three seats which will expire this November '92 on the AMSAT-NA BOD. The following names will appear on the ballot:

Joe Kasser (W3/G3ZCZ)
Tom Clark (W3IWI)
Eric Rosenberg (WD3Q)
Dick Daniels (W4PUJ)
Mike Crisler (N4IFD)
Joe Holman (KA7LDN)
Bob Diersing (N5AHD)
Andy McAllister (WA5ZIB)

Each elected board member serves a two year term. Look for your ballot to be included in an upcoming issue of the AMSAT Journal.

1992 AMSAT FD COMPETITION

HR AMSAT NEWS SERVICE BULLETIN 172.10 FROM AMSAT HQ
SILVER SPRING, MD JUNE 20, 1992 BID:$ANS-172.10
TO ALL RADIO AMATEURS BT

1992 AMSAT Field Day Competition Announcement

Believe it or not, Field Day is once again just around the corner on June 27th, and we are proud to announce the 1992 AMSAT Field Day competition. This year, we have implemented some special rules for the AMSAT competition to encourage the use of all amateur satellites, including the digital satellites. Here are the rules for the 1992 AMSAT Field Day competition.

1. ANALOG TRANSPONDERS

Each satellite is considered a separate band. All phone QSOs and all CW QSOs on a given satellite are considered separate bands. All packet/RTTY /ASCII/AMTOR QSOs are counted as CW QSOs. Phone QSOs count for one point and CW QSOs count for two points. Cross-mode contacts are not allowed. The use of more than one transmitter at the same time in a single band is prohibited.

2. DIGITAL TRANSPONDERS

Each satellite is considered a separate band. The following uploads/downloads each count as a CW contact (two points): (a) Download of the AMSAT Field Day file from the broadcast rotation on the MicroSats, (b) Upload of the Satellite Field Day Greetings file, and (c) Download of Satellite Field Day Greetings files. Satellite digipeat QSOs do not count for any score. The use of gateway stations to uplink/downlink is not allowed.

SAMPLE SATELLITE FIELD DAY GREETINGS FILE:

"Greetings from W8XYZ Field Day Satellite station in Egypt, OH with 28 participating members. Good luck & 73s."

3. OPERATING CLASS

Stations supplied only with emergency power are in a separate operating class from those that utilize commercial power.

Work is currently in progress to get the AMSAT Field Day file uploaded and included in the broadcast rotation of the MicroSats or in the text frame of the digital-capable satellites. A

Satellite Summary Sheet may be found in the March/April issue of The AMSAT Journal on page 27. Please submit your AMSAT Field Day competition results to AMSAT headquarters, 850 Sligo Avenue, Silver Spring, MD 20910-4703 by August 28, 1992.

Competition was tough in 1991 and should be even tougher in 1992. We hope this competition provides satellite operators with the practice necessary to be able to set up a ground station and effectively operate the satellites in an emergency situation. Remember that Field Day also provides a good opportunity to give some newcomers a chance at operating the satellites. Most of all, it should be a lot of fun for all who participate.

GOOD LUCK ON FD

/EX

Source record: 288257

The following may sound like a dumb question, but:

For the optional Novice/Tech station, does each novice
segment count as a separate "band"? Eg, if my novice
station works someone on both 40cw and 80cw, is that
a dupe, or two separate contacts?

I would have thought the answer was obviously that they were
separate non-dupe contacts. However, this is not the way that
CT scores them - CT only has one category called "novice", not
separate bands.

Another reason I began to wonder is that FD has other peculiar
definitions of what's a band and what's not. For example,
satellite is only one band -- you can't count the same station
on both sat cw and sat ssb for credit. This seemed so bizarre
we called HQ last year for clarification and they said "Yup."
We asked them to clarify the rules in the May QST, but they
didn't bother - this year's rules are no clearer on this point.
We wasted a lot of effort last year on what turned out to be
worthless dupes on satellite. Oh well. By the way, CT also
scores this incorrectly, but that's understandable, given the
confusion.

What do the rest of you think?

-- 73 de Chris Thomas, AA6SQ (ex-WA6HTJ) (CSMSCST@MVS.OAC.UCLA.EDU)

Although I am by no means an expert on radio theory (even though I have a Novice class license from years ago, but I was only 10 then and forgot most of that!), I am quite famiuliar with cellular.

In my experience, service in fringe areas is VERY transitory and spotty. You can have a perfectly clean signal in one spot, when 3 feet a way you get "No SVC". This is usually due to intereference and propogation patterns of cellular in areas lacking a good degree of signal saturation, such as a remote area which can only "see" one tower, maybe many miles away.

(Anyone who lives in Western Mass who uses a cellphone will tell you that they can pick up the Boston system from the hills west of North Adams, simply because the tower in North Adams does not get a clear line to your cellphone.)

Thus, a few things:

If it is a handheld, and you see like 4 or 5 bars, remember that a handheld will only put out .6 watts, not the full 3 watts, unless your handheld has some sort of adapter to boost the signal to 3 watts. Thus, your phone may receive the tower just fine, but it may not be strong enough to contact the tower in return. If it can not "talk" back to the tower (ie, send "overhead" and other call set-up info), you will not be able to make or receive a call. If your switch uses "autonomous registration", you may not even be able to be "found", ie, if you are on the NACN or similar network, simply because you get 5 bars does not mean the cell system knows who you are, as your signal is too weak.

If you do not have a handheld, but rather a full 3-watt phone, you may want to try moving the phone around a bit and see where you get the best signal. IE, go on the roof (if possible) and see where the signal is strongest, ie, where you can make a call (try "611" or just some nonsense number like "233" or whatever so you don't get billed). You may even find a spot in the cabin that has OK reception. (Note that these spots can change due to poor weather, or when the cell co. retunes the antennas.)

If you find a spot, then run an antenna from that spot, or just leave the phone there. I have tried using larger antennas than those normally associated with cell phones. Most recently, I tried one of a boat. For me at least, these did not help all too much. The main problem is getting the signal from YOUR phone back to the tower (assuming you are getting service), and although a highly-placed antenna may do the trick in some cases, don't count on it. (I trust you are using an atenna matched for cell freqs, correct?)

Note that if you are getting "No SVC" quie regularly in that general area, no matter what atenna or mechanism you use, you will probably just not get service until the cell co. puts up a tower nearby. Cell is not like AM radio or SW, and if you are too far away from the tower to set up a two-way path of reasonable quality, you will simply not be able to make/receive calls.

Finally, your cell co. may have a threshold set for calls which is above what they will normally allow before a call is dropped. IE, if you are already talking, you can get pretty staticky before you're dropped, but if you try to initiate a call in the same spot, the call will be refused.

If you tell me where (reasonable proximity) the cabin is, I may be able to tell you if there is coverage there and who provides it.

Good luck!

-Doug

I've seen a freeware/shareware test program on the net somewhere but it was cumbersome to use and did not include the schematic diagram questions. Try looking on wsmr-simtel20.army.mil. Also, the questions pools in text form can be ftped from uxc.cso.uiuc.edu.

The best one I've seen is one I bought for $30 at HRO called:

"HAM OPERATOR Education Package"

It contains all the tests including all the questions with schematic diagrams. The manual contains pictures of the schematics to go along with the on screen questions. It was very easy to use and had lots of options. For example, just a few options you have are:
1) You can test on screen;
2) Make printed copies of tests;
3) You can make random tests similar to real VEC tests;
4) Test yourself on each complete subelement;
5) After taking test, you can quickly review failed questions using the Go-Wrong command key;
6) You can have it tell you immediately if your answer is wrong or wait till your done to tell you which ones are wrong.

Well anyway, you can tell I really liked it. I bought it about 6 weeks ago and have passed all the written exams.

Also, I used the AMECO books along with the software. These books contain each question followed by the multiple choice answers, the correct answer, and explaination of the answer along with any formulas needed. These books make a very good companion or alternate to the software and are pretty cheap ($5-$6).

3787. Antenna Tuners?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-22 04:19:13 UTC
From: rrw@naucse.cse.nau.edu
Message-ID: <5208@naucse.cse.nau.edu>

Desiring to run a mobile HF rig, I've bought sevearl HAMSTICKS for different bands. However, it's getting to be a real pain to switch them out (even with a quick disconnect). So I'm thinking about an antenna tuner which hopefully could be run in an auto (maybe with a 102" CB whip?) I've searched the indices and find reviews (but don't have on hand) on Ten Tec and AEA (don't know if the AEA is auto, though). I also see ads for an SGC unit (list $595). I'd be curious to exchange notes with anyone using any of these. THANKS!

OK ...
About this secret ritual thing: I've always wondered exactly what it is, I guess that's why it's a secret. Well ... I think it's rather an interesting thing myself. I really don't think something like it would turn young people off; it's merely another thing to do. It is not ham radio. Ham radio goes far beyond secret rituals, and, indeed, this is a VERY small part, very insignificant. I think that ham radio has so much to offer to anyone that some people will find something to fire 'em up. Secret rituals or no. I didn't know about this till I got my ticket, and so what? I've been a ham since I was 14--close to 5 years now. It's been lots of fun. I've met lots of interesting peoople. I've learned a good deal, and I've learned to appreciate things ... radio, code ... history too, or at least history of radio, how far we've gotten and all that. It's gotten me out of a jam or three as well. I think that all of this is what ham radio is, and more, and it overshadows whatever "geekiness" is found in some secret ceremony held in the dead of night or whatever. To argue that this is why teens and young people in general are not involved in ham radio, IMHO, (I think I can say this--I am a teen no less) is silly!
As I've said, I've gotten plenty of enjoyment out of ham radio. If you're interested, then you are; if you aren't, then well...you're not ... and probably because you don't care about radio or don't feel like putting in the effort, adult or youngster.

Enough from me...it is late and I think I am not making much sense. It's too bad my last post on this subject was aborted; it was much better. ;)

From: majewski@spsd630a.erim.org
Message-ID: <MAJEWSKI.92Jun22130846@spsd630a.erim.org>
Source record: 288285

Hello-

I am in the process of applying for a building permit to put up a self-supporting tower on my property. My local building inspector has requested information that shows how my chosen tower complies with standard EIA-222D-86 for wind load, ice load and uplift. He is unable to provide me with the specifics of the standard.

I have called the tower mfgr (Heights) -- they have a full set of engineering backup, but were unfamiliar with the specific EIA standard.

Can anyone send me the text of this EIA standard? Alternatively, can anyone cite a book/publication that would have this?

Thanks in advance for your help and 73!

>better think in terms of revitalizing clubs as welcoming institutions
>for prospective hams as well as rehashing the now-moot point of whether
>incentive licensing should have been instituted.

The clubs of which I'm a member have rapidly growing memberships *now*.
Many of the new members are new Techs in their 20s and 30s. Most are
from technical fields, some are in leadership positions in their work
fields. They have certainly revitalized the clubs. One is now president
of one of the clubs. One popular change he has made is to appoint a greeter
for newcomers to the club. Most of the older members are somewhat cliquish
and a newcomer hardly felt welcome before. Now they have a smiling face
to welcome them and introduce them to others. What we aren't seeing is
really young hams in their teens. Out of three clubs, we have a grand
total of *one*. This remains a serious failing.

I've agitated for the clubs to sponsor school clubs like we used to do
prior to 1967. One of our new members is a fourth grade teacher. She has
started using amateur radio in her classes to teach geography. But there
aren't yet any club stations for the students to use. I did convince
our packet group to fund a TNC for one of the schools, but that's not
nearly enough. We need to get permanent stations installed in the schools
and adult volunteers to introduce radio to the kids.

>Incidentally, I did not like incentive licensing at the time but took my
>higher-class license exams/passed them in order to keep the privs I

>& 24 mHz). I would be interested to know whether the 1952 FCC action to
>open the bands to all classes of amateur except Novice and Tech resulted
>in a disproportionate increase of hams. Interesting material here for
>someone's sociology thesis.

I believe you will find that there was explosive growth throughout the 1950s in amateur radio. The annual rate exceeded 10% a year. I *believe* that the egalitarian licensing structure had an effect, as did Sputnik and the renewed emphasis on science and engineering that it brought to high school curriculums, as did the strong school club structure. As a fourteen year old General, I was elected net control station for the Ky traffic net (phone). That was quite a step for a kid to be in charge of a bunch of mostly adult operators. That was due to the strong school club that helped me get licensed and provided a place to operate. When I met other net members eyeball to eyeball at hamfests they were often surprised that their net control operator was so young. They didn't really know me except as a strong voice on the radio. Heady stuff.

> This unit probably will come with most bells and whistles, but
> I don't need many. I have heard good things about the Kenwood
> TM-741. What have you heard about it? Pro/Con....

I won't give all of my usual Kenwood tirade here, but try this test before you buy. Key down for five minutes and see if you can stand to touch the unit. Thermal design is not a Kenwood strong point in their VHF/UHF gear. For repeater use, it's going to be keydown a lot. Keep this in mind. It also doesn't properly obey PL when in crossband repeat mode. It kills the audio, but still keys the carrier. This is a major negative.

> Any other preferences? Why? Is Standard worth the extra $$$?

My personal favorite is currently the Alinco 570. It has excellent thermal properties and allows PL control on both bands. It has a built in duplexer and it's cheaper than most of the other dual banders. The Alinco 590 is currently being closed out at an attractive price. It's also a good value, but it doesn't have a built in duplexer (a plus if you need to run separate antennas, otherwise a minus). It requires an *optional* PL module. And it needs a fan (built in) for thermal control. It works well, however, and the total price is still excellent. The newest Alinco, the 599, combines the best features of both of the other radios. It's new on the market, though, and I don't have any direct experience with it.

>2. Next is the antenna.... Have been thinking about the Diamond SG7900.
> That is a long antenna with good gain 5/7.6... but it IS long.
> I don't have my AES catalog here, but I remember another
> Diamond that is about 4' long that has about 1/2 the above gain.
> Anyone have experience/preferences for a good gain mobile?

I've not been impressed with Diamond antennas. Comet has some good values including a small cellular look-a-like dual bander that I use. I also strongly recomend the Larsen dual banders. Larsen antennas have a fine reputation in commercial service.

> How about attaching one of these to the vehicle? I have a Ford
> Explorer with one of those wide bar luggage racks. Are the
> thru-the-roof mounts strong enough to handle the wind resistance
> of these long antennas ok?

Yes, drill the hole and use a Larsen NMO mount. Don't be tempted to
mount to the luggage carrier or gutter. The superior ground plane
provided by direct center of roof mounting is really worthwhile.

>3. Finally, as mentioned above, I would like to xband repeat thru the
> mobile. Maybe stick the vehicle on a high hill or mountain top
> and use 70cm input and output on 2m.
> Seems like Yaesu FT470 has been a good bang-for-the-buck. I
> also recently read there will be a somewhat imminent replacement
> coming out for this model.

I have a FT470 and it's a nice walkie, but it's not what you want for
a dual band repeater or mobile. It will only crossband on the low power
setting (100 mw), and the audio is coupled via the speaker and mic. You
can make an external cable to couple the audio, in fact you *should*,
otherwise the audio quality will be lousy and you will pick up noise
and conversations near the walkie when it's repeating. But then you can't
monitor it's activities. The internal speaker is totally unacceptable for
use in a utility vehicle. With an external speaker you can get decent volume,
but the internal speaker is only useful in quiet locations. Otherwise it's
a fine HT with an outstanding user interface. You never need read the manual
unless you just want to. Thermal control is excellent. Battery life is
excellent. And the price is really aggressive. I *carry* one, but it's
not a realistic substitute for a mobile rig.

I've got an MFJ 949C tuner in my car. I put this in mostly for the SWR meter, but it saves me going out and diddling the little whip on the end of the outbacker. Yeah, it's almost as large as the radio, but hey, I've also got a Shure desk mike sitting on the stack too (it was the only one I had with the right plug on it).

Source record: 288268

Hi all !

I recently bought an TM741E kenwood set. I saw that the microphone uses only 8 wires to connect to the unit. These connections are described in the manual, but the 4 pushbuttons on the front of the mice seem not to have a direct connection to the set, as does the DTMF keypad on the dtmf mic.

I am wondering how the mic communicates with the set. It might be interesting to know how this is done in order to control the set with my computer. Also does someone know the protocol, or does someone have the schematic diagram of both the standard and/ or the dtmf mic ?

Another intresting point to intercept might be the wire between the base unit and the detatchable front panel. I noticed that there is some serial communication between the two parts. (synchonous, there seems to be one clock line....) but again: has someone figured out the protocol, or built an interface for it ?

Thanks for all info.

Please mail me at rudi@cs.rug.nl

Mark--

I have an R-5 vertical mounted on the chimney of my house with no problems. Even the architectural control people haven't raised a fuss (yet)--probably because it is no more intrusive than a tv antenna.

The R-5 (and I assume the R-7 as well) is a great vertical. It won't compete with a beam, but when propagation is good it will get you through. I have worked into Japan, Australia, the middle east, South Africa, and the Soviet Union when conditions are good.

The R-5 works on 10 through 20 meters, and the R-7 extends that to 40. (I have a half size G5RV in the trees in the backyard to get on to 40 when I want. I haven't yet figured out a good way to get an 80M antenna up in my location.)

The R-5 goes up real easily. No radials are required other than the little four foot ones that come with the antenna and stick out at its base. I assembled mine in short order (half hour, I think), put it on the mast and got it up onto the roof. I think the things that took the most time were putting the straps around the chimney while trying not to fall off the edge of the roof and cutting down the mast to the right size.

Hope this helps.

Source record: 288265

Recently I bought a Realistic Scanner type PRO-9200.
I noticed that this unit only locks on frequencies which are within
approx. +/- 3 kHz in the range of this scanner.
Normally this is no problem at all in the VHF low and high ranges.
In these ranges the freq. steps are 5 kHz which cover almost all freq.
On the UHF ranges, however, the freq. steps of the scanner are 12.5 kHz
whereby most users (in Holland) are using a 20 kHz raster rather then 12.5 kHz..
In this way I am losing most signals because the freq. difference are
in rhis case greater then 3 kHz.
I can actally receive the signals by turning down the squelch, then I receive
all signals very brightly within approx. +/- 10 kHz.
It has something to do with the squelch circuit which normally detects the
signal-to-noise ratio of the signal. I suspect that the freq. error
is detected with the discriminator output voltage (DC component)
which is related to the center freq. of the received signals.
Is ANYONE familiar with this feature?? The problem is that I have no
documentation of this type, (neither has the support representative in
Holland).
I would like to know if it is possible to change the range of the
discriminator swing (probably by attenuating its output connected to
the sqelch circuit....).
Anyway, I would like to know if this feature is "normal" or maybe a malfunction.
Of course, I am very interested in the schematics of this scanner.
I hope someone can give me an address to buy it, or just someone who is
willing to send me a copy.

Thanks in advance,

Tom Staal PA2TSL - Almere - Holland

As I recall, no one makes 40673s anymore. Strictly speaking, the 40673
will not be commonly available much longer. The ECG222 is a direct
replacement, so I'm told.

>please why I should by one of these radios? Any other suggestions?

I have really been enjoying my Alinco DJ-580T; I have but two complaints:

1) The volume and squelch knobs. They are made of hard, slick plastic and
it's nearly impossible to adjust the squelch without accidentally changing
the volume setting. I wonder if anybody makes after-market knobs that are
easier to grip (neoprene? rubber?).

2) With the earplug, the squelch makes a really annoying pop when a signal
breaks the squelch level.

|>scores this incorrectly, but that's understandable, given the
|>confusion.
|>
|>What do the rest of you think?
|>

I think it's time to lobby for a change in the rules. Our club is putting a lot of effort into finding field day activities for no-code Technicians. Satellite is one that's an obvious shoe-in and I think they should be able to play under the same rules as everyone else. CW is different than SSB, etc.

I also would like to see a transmitter exemption for a Tech VHF/UHF SSB and CW station similar to the exemption for Novice stations. While there's nothing preventing the Novice station from being in the high bands, it would be a tactical bad move to give up long range communication for short range. This would make it painless.

A no code license is just the hook -- we have to provide an incentive to learn code then get their full-priv (extra) license. Not pressure -- just incentive.

I am unfamiliar with a model PRO-9200, but I don't think you
should change the discriminator.

Many Radio Shack and Bearcat scanners employ a "window
detector" circuit which prevents the scanner from locking on
an off frequency signal in the SEARCH mode.

Window detector implementation is a fairly symmetrical cir-
cuit of operational amplifiers. The window detector com-
pares the output of the discriminator to see if the voltage
is within bounds (+/-) set by some resistors. The output of
the window detector is used a logic level.

If the discriminator output is out of range, it means the
signal is off frequency and the microprocessor controller
will continue the search operation. If the discriminator
output is within range, it means the scanner is tuned near
the center frequency of the signal.

The size and symmetry of the "window" can be changed by
replacing the appropriate resistors, or you could disconnect
the output of the window detector completely.

3809. Re: Beam Antenna For Cellular Phone ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-22 16:55:16 UTC
From: WFAUST@NOMVS.LSUMC.EDU
Message-ID: <9206221653.AA25736@ucsd.edu>
Source record: 288282

Just to relate two points from past experiences trying to use a
cellular phone from a vacation home.
1. Use the lowest loss feedline that you can. The miniature heliax
works very well. The little bit of power you put out at 800 MHz
gets lost really fast.
2. A corner reflector worked best in my situation. The reason, another
cellular system was stronger than my home system, and the phone
kept wanting to roam to the other system when using a vertical atop
a tree. The corner reflector effectively blocks signals from behind
where a beam or vertical does not.

Someone recently enquired about whistler reception. I couldn't find this info at the time, but here it is. Mike Mideke has written an excellent introduction to the subject, called "The Whistler Hunter's Handbook." It includes schematics for usable receivers and explanations of what causes whistlers and when to listen for them. I believe it costs $6.00 ppd in US. His address is:

Michael Mideke
P.O. Box 123
San Simeon, CA 93452

Please tell Mike where you heard about his book.

Mike also publishes an occasional article in "The Lowdown," which is a monthly newsletter dedicated to low- and medium-frequency listening and experimentation. You receive The Lowdown with a membership in The Longwave Club of America. Dues are US$12.00 for 1st-class mail in the US, and US$20.00 for overseas airmail. The address for membership is:

There is also the element of general curiosity in the child. Some children are not that interested in learning. Some are interested in some things and not in others. I don't know how you get a child to be curious, and to want to learn about the world. Providing a stimulating intellectual environment helps, but some kids still are not interested in learning even with that.

QRP seems to be a lot more effective on 10m, however. What sort of experience
have people had using QRP SSB on 40 and 80? I sometimes have trouble
getting through with 100w, considering all of the 1KW stations
on the band.

Your building inspector is one revision behind the times. The current incantation is 222-E-91 "Structural Standards for Steel Antenna Towers and Supporting Structures" 112 pages. Available from Global Engineering, (800) 854-7179. $64.00. I can't suggest an alternate source for the spec.

He can't provide you with the specifics of the spec? That may imply that he doesn't have a copy, in which case I'd doubt his ability to evaluate your response to his request. If the municipality requires compliance with a particular spec, surely they have a reference copy you could inspect.

Good Luck.

> for an SGC unit (list $595). I'd be curious to exchange notes
> with anyone using any of these. THANKS!

I am currently using an Icom 726 with the AH-2 automatic tuner. It works very well. You just push the button on the front panel, and within a few seconds, the antenna is tuned. I use it with a Valor 10m whip (similar to a 10m Hamsitck), and it works well on 80m through 10m. This is a really nice setup, and it can be used while driving.

I have also used an Icom 735 with an AT-150 auto tuner. This can be made to work, but it is not nearly as good. You need to have an SWR meter hooked up to verify that the antenna in tuned. It also has a harder time tuning to all of the bands. It should not be used while driving, as it requires too much concentration and attention from the driver. There is a better tuner for the 735- I think it is called the AH-3.

A regular MFJ tuner (about $100) could also be used, but again, not while driving. It can take a couple of minutes of spinning knobs to tune the antenna properly

I do not have experience with the SGC product.

From: vjh21@cas.org
Message-ID: <1992Jun22.214144.29831@cas.org>
Source record: 288300

From an earlier posting I saved...

From: plav@cup.portal.com (Rick M Plavnicky)
Date: 3 Dec 90

Well, it is serial but the signals themselves are not RS-232. Here's what
their port looks like (excuse the crudeness...):

```
---------------o-Vss
|| ___________o-TX
|| \/
|| /\_________o-RX
||
```

Output from TX, logic low is 0v and logic high is +5v, with reference
to Vss. Input to RX follows the same logic.

Once you build your cable (or buy their high priced PC cable) you
should be able to hook up to it using a terminal and puzzle out the
data formats. They ain't tough.

The software basically uses xon/xoff protocol to keep the Casio's
buffer from overrunning, but otherwise is pretty straightforward
async stuff. It just moves bytes back and forth, no protocols like
zmodem or kermit involved here.

Sorry, but because I'm bound by a non-disclosure agreement I cannot be
more specific. You might try writing or calling Casio for more
information. Here's the address info:

My friend brought over his new AEA-FAX unit. We played around with it
a got a couple of nice gray scale images.

We are looking for HF fax frequencies and schedules. The AEA manual
had a few, but there must be many more.

If you know if any frequencies and schedules, please pass them along.

If I get a good list, I collect them and repost in a few days.

Thanks,

Randy

>That is the plan. Current VHF TV will be reallocated to ground-based
>"personal communication" services. FCC expects the transition to take
>15-20 years. I suspect it will happen a little faster as HDTV receivers
>appear much cheaper to produce than expected due to advances in computer
>display and compression technologies.

Must be a secret plan; I've never heard of it.

But I am encouraged that it might even happen as soon as 2010. VHF-TV
is the most intensive waste of spectrum there is. The 174-216 MHz band
would be an excellent resource to relieve spectrum overcrowding, and
an opportunity to apply new technology without having to conflict with
the old.

More wild ideas:

Add 76-88 MHz to the FM broadcast spectrum.

Make 54-72 MHz a new narrowband FM "personal broadcast" (40 kHz channeling)
service. Licenses and frequency allocation would still be required but the
process could be shortened or reduced to make it easier for very small
stations to get on the air.

But maybe the bigwhigs in the networks and broadcast conglomerates might
not like these ideas.

>Some of the emerging satellite-based direct brodcast TV companies are
>currently transmitting compressed digital RGB. These companies will
>probably offer HDTV services in 2-3 years.

Lossless or lossy?

Hello, OM.

I investigated their papers of Yagi-Uda array.
1925 Dec.28 Pat. "Denpa-shikou-houshiki" applyed by Yagi.
1926 This Pat. is accepted #69115. Japan.
1926 Feb. "Projector of the Shapest Beam of Electric Waves",
Proc. of the Imp. Academy ("Nihon-Gakushiin-kiji") Yagi, and Uda.
1928 Jun. "Beam transmission of Ultrashort waves"
Proc. IRE by Yagi.

They are the first paper of Yagi-Uda array, maybe. Most of them is
written only by Yagi, so this array is called "Yagi" array.

Prof. Yagi had the call J7AA before World War II, and was member of
early JARL.

From: Kirk.Smith@bbs.oit.unc.edu
Message-ID: <1992Jun23.022331.28979@samba.oit.unc.edu>
Source record: 288303

I have the possibility to pick up some radios cheap (maybe free if I can
sell some) but I'm not sure what they're worth or if they're any good.
They were donated by a police department and then abandoned, so they have
no manuals for anything. If anyone can tell me what these are (and maybe if they're worth
anything), I'd appreciate it.

The id is as follows:

GE Mastr II Comb: MX55KFU89A (one of these)
GE Mastr II Comb: MC55KFU89A (11 of these)

Also GE MPR VHF HTs, Comb: P2BJJ65BBN (looks like a button for squelch,
a toggle switch marked CLE, a toggle switch marked P/P, and a volume knob.

Thanks!

The following article appeared in the June 21st Sunday Boston Globe page A2. A list of 26 Area (MA NH CT +RI) club FD QTH's followed. I am posting it here as some of you may find it usefull for you own publicity efforts. Feel free to use it as long as you give W1BG credit.

I will post the complete list seperately as it will only be of interest in New England.

73 Steve F

P.S. Penn and I would like to know if you get it published elsewhere.

"Hams have a Field Day preparing for emergency

By Penn Clower W1BG copyright 1992

Next weekend, June 27 and 28, local Radio Amateurs will be participating in the annual Field Day exercise sponsored by the American Radio Relay League. Field Day is fun with a purpose: it's an emergency communications drill disguised as a combination radio contest and picnic. Hams try to contact as many other stations as possible in a 30 hour period. Their performance is scored by a set of rules tilted to favor temporary station setups run from non-commercial power sources. Area radio clubs will begin putting up their Field Day stations late Saturday morning, and the public is invited to drop by to see what the hobby is all about.

Amateur Radio is as old as the art itself. Many people are surprised to learn that the hobby predates the vacuum tube, and that early hams sent messages hundreds of miles using transmitters made from car ignition systems. Today's amateurs communicate worldwide using voice, Morse code, computers, television, and even satellites. Ham operators must pass an FCC examination covering radio rules, theory, design, and safety. There's no age limit to take the exam however, and with recent rule changes the entry level license is easier to get than ever. Radio hams shouldn't be confused with CB operators though. There's no license requirement for CB, and CB operators, unlike hams, are restricted to low power sets of fixed design and limited range.

In return for earning a license, hams are allowed to design, build, and operate their own radio stations. They do this in many different ways, and the hobby seemingly has something for everyone. Some amateurs delight in tiny portable sets, while others assemble stations powerful enough to rival commercial broadcasters. Purchased equipment is the rule, but many like building their own accessories or modifying sets for peak performance. Most amateurs enjoy contacts with other hams in remote parts of the world but still find time to chat with friends in neighboring states. Radio contests are a popular weekend activity and help develop operating skills. Field Day fits roughly into the contest category, but is unique because of the emphasis

on temporary outdoor setups using low power.

Field Day has been a popular summertime event for years. It's designed to encourage hams to assemble the equipment and skills needed for emergency communications. That means being independent of commercial power as well as the comforts of home radio setups. To add an element of competition and fun the event is also set up as a contest. Points are awarded for each radio contact, with a system of bonus points awarded for operation with different modes and transmitter power ranges. Low power sets earn more points per contact because they're more likely to be useful in emergencies. They're smaller, easier to move, easier to run from batteries, and can be put on the air with less fuss. Bonuses are also awarded for using alternative energy sources (solar, wind, or even muscle power!), satellite and computer contacts, and public information displays. Hams see Field Day as a good excuse to get outside for a weekend of picnicking and radio. For the public it's a wonderful opportunity to become acquainted with a hobby that's advanced from crystal sets to satellites.

The traditional Field Day setup of years past was in a state park and consisted of several tents, a bewildering net of wire antennas, and a few sputtering gasoline generators. Today the operating site is just as likely to be a shopping center parking lot. With modern transistorized equipment the generators are often replaced by batteries and solar panels, but the antennas can still look confusing to the uninitiated. The following is a list of locations to be used by some of the larger radio clubs in Eastern Massachusetts. You're encouraged to drop by and visit any of them during the contest (which runs from 2 PM Saturday until 5 PM Sunday). It's a great opportunity to see the full variety of amateur radio communications and learn more about this fascinating hobby."

This is the SHF systems unit. It is on three fairly large boards, LO, TX mix, and RX mix. One of our group bought one at Dayton. I haven't heard from him whether it works well or not. It certainly looked simple enough.

It continues SHF's tradition of no tune stripline construction. Only the LO requires any adjustment. Frankly, the LO is the heart of the system and, using my 902 unit as a benchmark, I'd say it's also the weak link in SHF's transverters. It's certainly the major failing of the Hamtronics units. Getting a good clean LO signal is difficult. Let us know if it works out.

>What is the minimum acceptable channel spacing of the 56K modem ?

The modem is 70 kHz broad and operates on 100 kHz channel spacing.

There are at least two ways to go, Ramsey and Hamtronics. The Ramsey transceiver has been discussed here by several people. The kit is relatively sound, but the tune up instructions are useless. Hamtronics has a line of receiver and transmitter boards that are ok. You'd have to come up with your own cabinet and harness.

The combination numbers for the radios in question work out to be
the following.

M M model Mechanical Package
X +-12volt DC System Voltage (C is also +-12vDC)
5 21-40 watts Power Output
5 25 KHz Channel Spacing
K 8-Frequency Frequency Capability
F 4-xmit:4-recv Number of Frequencies
U Channel Guard Options (also known as PL)
8 Frequency 470-494 MHz
9 Range
A 0.0005% Frequency Stability

I have used several radios of this type for ham repeaters in this area
but they were the 450-470 version of the radio. It might take a bit
of work to get these into the ham band. GE will sell you a copy of the
manual for about $50 as I recall. It can be a tough manual to
photocopy as it has a lot of fold out schematics. Good Luck

I am looking for a small Extruded Aluminum Box that has a slot for a PWB and two end plates. What companies carry this type of box? The box is frequently used for modems (Hayes), the Kantronics UTU, etc.

I need one that is approximately 5x5x1.5 with end caps that attach with screws. An pointers would be appreciated.

How well Rick's transverter works depends on what input MMICs you
use. If you have a real noisy 902 band, which isn't unusual in
some places, you really need a transverter built like a well designed
40 meter receiver. Solution--don't use ANY MMICs in front of the mixer.
Sure, you will probably have a 13 dB or so NF, but chances are, there
is enough background noise on channel that it doesn't really matter--just
like 40 meters. If things are really bad, you may have to add some sort
of cavity or interdigital filter, but this would be needed with just about
any transverter.

Even if you don't modify Rick's board to use +17 dBm mixers, I suspect
that people using early versions (1987) of the 56 kb modem will have
trouble with the modem front end crunching before the transverter.
The schematic I am looking at just has a 3N204 mixer with a PI network
input matching section--not exactly what I'd call high performance.

To fully take advantage of an SBL-1X mixer with a 10 dB post amp, you
really need something with a +15 dBm 3rd order input intercept and a 3
dB NF (for those of us accustomed to 500 Hz BW RX specs, this is a
108 dB dB DR!). Not surprisingly, the VHF contest stations use the
best HF rigs they can get their hands on for IF radios. I suspect
that even the latest 56 kB modem doesn't come close to making an
SRA-11H mixer worthwhile.

Incidentally, you might wonder why I haven't published anything on these
high level mixers. To be honest, they really are lab curiosities. You
are unlikely to see any benefit--simply because you need to clean up
the broadband/phase noise of the interfering transmitters to see
the advantage. For the few who can clean up those "other" transmitters
on the hill, great, but most of us can't. We are lucky just go get our
stuff up there.

A way to make Rick's transverter exceptionally clean is to spend a few extra $$ and get crystals around 190 MHz instead of around 95 MHz. Not needed in most cases but this sort of stuff pleases some people...

Finally, it pays to investigate all the bands and see which are quiet and which aren't. Instead of getting expensive filters, it may make more sense to use a band that doesn't need any. Perhaps the best way to evaluate a band is with a low level signal source/linear transverters with an AM or SSB receiver and a set of attenuators. Combine the low level source with the attenuated input from an antenna and see how little attenuation you can use and still hear your source. Of course some noises like radar are intermittent and easily missed.

I'm sure Tony knows about this but others may be interested to know
that WSC, Tuckerton Radio, in New Jersey sends weather reports in CW every day
at 1218 UTC on 12879.5 Khz. The sending speed seems to be 20-25 wpm and they
came into Buffalo this morning at 599. WSC is probably more convenient for
East Coast ops to copy.

3849. Looking for tnc kiss-mode info

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-23 14:53:20 UTC
From: znha@bnr.ca
Message-ID: <1992Jun23.145320.12046@bcrka451.bnr.ca>
Source record: 288312

I'm curious about my mfj1278 tnc in kiss (host) mode. I can enter it and have
a driver program that will then speak IP through the tnc. Like all things, though,
I'd like to change it to:

1. return back to "normal" tnc mode when the driver quits; and
2. make regular virtual-connect protocols available.

Is there net.wisdom on what sequence of bytes to send the tnc to leave kiss? Also,
decoding of packets--is there a description (ideally, code fragment) of the protocol?
I recall reading something in the back of a kantronics KPC manual about the mode, and
it had something like:

send " 0xdd oxdd ....data.... 0x0d" to cause the tnc to transmit data
send " 0xdd 0xdc 0x0d" to cause the KPC to leave KISS mode.

Do mfj's have such a thing? The manual is not detailed--so help is muchly appreciated,
73, Gord.

In article <1992Jun22.123417.5981@hemlock.cray.com>, I promised:
> [...]
> produced a 28 <-> 430 transverter. As soon as I can find their
> phone number, I'll do some research and post my findings.

I just got off the phone with Down East Microwave. Here's what
I've discovered...

They do indeed have 28 <-> 432 transverter kits in stock. They are
based on the same design as their various designs for 900MHz and
above. They consist of 3 boards (all 4 5/8" [11.8cm] x 5 1/2" [14cm]):-

LO - Provides 2 outputs (+8dBm, I think). Can switch between two
crystals.

TX - IF drive needed: 0-3dBm, Output: 18.5-20dBm.

RX - NF: 3 - 3.5 dB, Conversion Gain 17-20dB

The TX & RX boards are physically identical, just populated
differently. The boards have identical mounting holes, so
you can stack them. The complete unit is about 1" [2.5cm] tall.

The TX drive is designed to feed a gain block like the Toshiba SAU4
(which co-incidentally DEM also sell :-)).

Add a 432 TX/RX switch (if you're going half duplex) and you're
set. Apparently there are a couple of units out there being evaluated
with the GRAPES modem, so either the evaluators are under non-disclosure,
they've got no net access, or they're naturally shy..

Here's the kit pricing :-

Complete transverter kit (boards & all components)......$ 155
Bare boards (set of three).............................$ 30
Toshiba SAU4 (not included in the $155 kit).............$ 50
PCB for SAU4 ....$ 9

So a 15W transverter kit will set you back around $214 + Tx/Rx switch..
(I don't know if crystals are included or not..)

Just for the record, I've got no affiliation with DEM, apart
from being a satisfied customer ..

Their address is :-

Down East Microwave
Box 2310, RR1
Troy, ME 04987

USA

(207) 948-3741 (voice - I lost their FAX number).

FYI, Ian (VE3PFH) informed me that the minimum usable channel spacing
was 150KHz.

Now if someone could post a reminder of the modem costs, I'd be able
to price out a system....

If you're looking for a good RF dual-gate MOSFET, the Philips BF980 series
is excellent (I say "series" because there are a whole bunch of slightly
different versions like BF981, BF990 (SMT) etc.). They are intended
for UHF TV tuners, but I found them to also be excellent in the 8 MHz. IF
of my FT-757 (I added two extra stages of IF gain to fix the 757's
famous poor sensitivity problem). It has higher IDSS than some of
the commonly used FET's so you may have to increase the bias
current somewhat if you're substituting it for a 3N211, etc. It likes
to run at 10 or 15 mA. At HP, it's used a lot for scope front ends
as a source follower to get a high input impedance.

3857. Slow charge for Ni-Cads?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-23 17:43:56 UTC
From: CELLIS%BROCKVMA.BITNET@cunyvm.cuny.edu
Message-ID: <9206231741.AA01311@ucsd.edu>
Source record: 288321

I've never run into this one before. I have a battery holder for my Icom IC-32AT which holds six AA size cells. I have populated it with Sanyo 600 ma Nicads. The desk charger from Icom, for this radio, indicates 12-15 hours for that pack in the charger (obviously not quick-charging). Interestingly enough, it appears, from the documentation, that the charger puts out 45 ma. of current in the slow charge mode. These cells can be charged at 60 ma (600 ma fast charge) - according to the printed legend on the batteries. A 15 hour charge in the Icom charger gives them a nice charge, as in they last quite a while, but I notice they are stone cold when I take them out of the charger. How long can I charge them for at 45 ma? I've never seen any comments on a slower charge rate for Nicads - always how fast can I get to yesterday. Any takers? (The Icom charger manual assumes you are using 450 ma AA nicads.)

Hi John,

The issue of coaxial cables is very complex, however, excluding physical
and/or temparature characteristics, T H E most importante gauge for the
quality is " Nominal Attenuation " per unit of lengh in dB @MHz.

From the Belden catalog p.101/107 - Belden 8214 Type 8/U has 1.8 dB/100'
@100MHz.
Belden 9913 Type RG8/U has 1.4 dB/100' @100MHz attenuation.

You get what you pay for , there is no free lunch.

This raises an interesting question. When mounting two or more VHF
antennas, how should they be mounted? Is it ok to have them
stacked one above the other on the mast? What if any are the
spacing considerations? You mention an H frame, I assume the
H is parallel to the ground?

How do you bring down the multiple signals from the antennas?
Do they each have a cable or do you "mix" them on the mast?

Source record: 288181

I can't imagine how the network types or even the owners of
local broadcast television stations could really want to hang
on to the present allocations, providing they got something
just as useful in the UHF or microwave frequencies. If one
lives on the fringe of the viewing area of one of the
stations occupying channels 2-6, a good portion of the Summer
is spent putting up with Sporadic E bombardment. For those
of us who are interested in radio propagation, this is
fascinating, but for most people, it is a real nuisance.
With stereo sound, the signal/noise ratio is much poorer due
to the decreased level of the stereo subcarrier and the
accentuation of any static crashes by the audio level
expander which is part of the stereo sound system.
Channels 7-13 don't get hit by E-skip as often, but
moving even those channels to higher frequencies would be a
good decision because television tuners and antennas could be
optimized for a narrower range than today's hardware.
The best way to go about this, most likely, is to use
the up-coming adoption of the HDTV standard as the
demarkation line between the old system and the new one. A
perfect example is the European abandonment of the Band-1
frequencies between 41 and 55MHZ. Somebody who can tell us
about how well that went should step up and fill us in.
I sure miss hearing BBC1 around 41.2xMHZ, but I'm sure
the Oklahoma Highway Patrol doesn't miss the S9 video
carriers that used to jam the network.

Gary, thanks for the reply..... I have been tending toward the Alinco's but have not settled on a model yet. the 570 sounds like a good one but the 590 on sale sounds better. However, as you mentioned the new 599 for a few bucks more (?) might be better in the long run.

Antenna wise, I think I have settled on the following...
Vehicle- one of the compact dual banders that show 3/5 dB. That should allow me to enter some parking garages without tiltdown. I agree with your recommendations on thru the roof vs the luggage rack.

If I use the MOBILE dualbander as a repeater, I will use the vehicle antenna as a receive antenna on 440 and the xmit on 2m will be a BIG HIGAIN antenna that I will mount on a 25' portable mast I have designed.

Your recommendation for the FT470 has been my choice as an HT and I will probably go in that direction once I firm up the rest of the rig. Maybe the price of these will drop once the replacement I saw mentioned in the postings is released by Yeasu. If any of the 2m mobiles will allow one to repeat 2m/2m that might be just as ideal as xband rpt. Other than emergency and public service events, I have no interest in 440. I just need high power/efficiency in *remote* locations and the ability to put my Explorer on a mountaintop and carry an HT.

Please let me know if you receive this. I am new to this editor and UNIX

73 es thanks for comments.

Hey! A new game when you tire of 'Trolling for Taillights'! :-)

These things are notorious for EMI sensitivity. Found one at a
commercial installation where the gate lights came on and the guard was
called whenever a truck pulled up. That guard sure checked a lot of
invisible trucks. They finally fixed it so it no longer serves as a
daily transmitter test. :-)

>on the band.
>
I use a Radiokit 75 meter SSB radio for checking into local nets around Alaska,
both
from home and while out in the bush. Statewide coverage is iffy -- when I am
in
Fairbanks and net control is in Anchorage (250 miles) or in Southeast Alaska, I
need a relay about a third of the time. The radiokit is about 40 watts PEP
(runs
of 24 volts -- two small gel cells).

3865. US ham in the UK?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-23 20:20:39 UTC
From: ericd@synoptics.com
Message-ID: <1992Jun23.202039.5821@netnews.synoptics.com>
Source record: 288326

I am planning to be in the UK for a business trip next month
and would like to take the 2m/70cm handheld along. Can I
legally use it in the UK? I can remove the resistor for
UK operation/splits with no problem, but what permits do I
need.

On another note, I am planning on taking a AOR-100XLT along for
the ride. Will I be hassled at customs provided I have the
papers showing that I bought it in the US?

Thanks

I am seeking advice for 2 types of TNC's
Currently I have a 232MBX for general use. I am trying to
find a cheep no frills TNC for TCP/IP use. Keywords are
cheep and no frills.

I am also seeking to find the smallest TNC possible to
couple with my HP95 doe portable packet. It must run off of
battery.

Suppliers, phone#'s and price guesses are appreciated!

3867. Airband on handheld HT's

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-23 20:29:53 UTC
From: ericd@synoptics.com
Message-ID: <1992Jun23.202953.6044@netnews.synoptics.com>
Source record: 288178

I am looking for a HT that can be modified to transmit on the air bands.
A friend is a piolt and is interested in becomming a ham. He would like
to have a radio for air band use in emergencies.

I understand that the modulation is different FM vs AM, and that
antenna lengths would change, and sensitivity would drop. On a
side note my Kenwood TH77A can recieve AM air, why can't it modulate
AM for transmit?

Thanks

Ah, yes! I am one of those people who put one of the Ramsey kits together.
As Gary says - the tune up instructions are useless. Consider for instance
the complete tune up instructions for the receiver:
Adjust L24, L28 and L14 for maximum noise. If you are satisfied then you
are done.
What if you are not satisfied as I was after following this procedure? After
maximizing the noise the rig was essentially useless with an apalling
sensitivity. To the kit's credit, it is possible to get reasonable
performance but this requires some additional tweaking of the band pass
filter coils.

>Hamtronics has a line of
>receiver and transmitter boards that are ok. You'd have to come up with your
>own cabinet and harness.
>
>Gary KE4ZV

I have heard a lot of good things about Hamtronics. A few years ago we
had Hamtronics receiver and transmitter in our 2m repeater. The Hamtronics
kits are not as flexible as the Ramsey ones (they are xtal controlled) but
they seem to be better designs. With proper options (such as a tcxo etc)
they are of commercial quality. I think I'll try a Hamtronics kit next.

What are your views about the Hamtronics kits?

>What is a good price per foot?

The discone is a low gain antenna, unity or less, so you need as low a loss cable as possible. The lowest loss inexpensive flexible cable, Belden 9913 goes for $0.62 per foot. Note that you need special N connectors for this cable since the center conductor is 9.5 gauge. For ordinary dual band fixed use with your 580, a standard dualband antenna like those made by Larsen, Comet, or Diamond would have considerably more gain. For wideband scanner use the discone is a viable choice, but it's lack of gain means that you need good cable.

Message-ID: <9206241748.AA23210@ucsd.edu>
Source record: 288220

Interesting comments on the USA's continued use of VHF TV;
theres little VHF TV still in use over this side of the pond. I think theres still a bit of it in France & Norway (I remember seeing maps showing no-go zones for 50MHz use in France).
Most European TV is now UHF, channels 41 to 68 (from memory thats 470 to 860MHz). The old 41-68MHz and 174-216MHz VHF TV channels have been reassigned to trunked mobile-radio services. We never had TV in the 68-88MHz band; this is used for mobile radio. We never had mobile radio in the 30-40MHz band though.
Some Eastern European (ex-Soviet-bloc) countries used 70-85MHz for FM broadcast radio. Radio Gdansk (Poland) on 70.31MHz is a good indicator of meteor-scatter, even though it is smack in the middle of the British 70MHz ham-band.
Maybe if the US VHF TV network is eventually closed down, you may be lucky enough to get a 70MHz band? It would go some way to making up for the loss of 220MHz! Us Europeans never had 220MHz in any case (and our 2-meter band is only 144-146MHz.... curses, foiled again!).
European standards are a mess! We use Phase Alternate Line (PAL) for color TV on UHF, with the exception of France (who use SECAM - dont know what it stands for). FM broadcasting, as i mentioned previously, is split into ex-Soviet-bloc 70-85MHz and 'Western Europe' on 88-108MHz. But there was an allocation around 100MHz for mobile radio (Police etc), and East germany used to use 88-108MHz for FM radio even though it was in the Soviet bloc! (apparently when the time came to decide, they hoped Germany would be re-unified sooner ratehr than later, so chose the 'Western' standard - a decision which, in the light of recent events, was very far-sighted!).

I wonder how easy it would be to re-tune a camcorder or similar TV signal source to the 450MHz ham TV allocation? Most camcorders, video-recorders etc. come pre-tuned to UHF channel 36. Who will be the first to transvert the output from a Nintendo console into the ham-band? (with player interaction from the controllers on Packet?)

>>

I'm a great fan of the Butternut HF6V antenna. I got my DXCC solely with a Butternut on top of the house, and later took it on a DXpedition in the South Pacific with equally good results. I've recommended it to some of my students, who are also pleased.

There's an option kit with radials to install on your roof if you put it on top of the house. On the DXpedition, I simply connected one or two copper wires where the radials normally attached, threw them in the ocean, and had an enormous ground plane! Occasionally, in bad conditions, I was told by hams on the other end that I was the only signal they could hear on the band.

As the name implies, it also gives you the ability to work six bands with one antenna.

Sorry that the bulletin is late but I was sick.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 066 (OPDX.066)
June 22, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, K4CEF & Southeastern Cluster Group, DXNL, DF4RD, G4ZVJ, JH1FDP, AD1C, K1MEM, WA1MPB, KE2LJ, WB3LHD, AA6LF, K6OZL, K7JA, W8GMH, N8HUR, WA8MEM, OD5ZZ and Y42MK for the following DX information.

30 METERS. Jim, K1MEM, (WAZ Manager) is informing everyone that Brazil (PY) has 30 meters privileges as of the 21st of February. This info was not disseminated to the PY community until it was officially published on June 12th. For the purpose of any WAZ award appliciation, Jim will consider February 21st as the acceptable date for 30 meters contacts claimed with any PY station. On a related note, Jim has recently received full documentation from the government of Chile (CE) relating to frequency allocations. Jim wants to remind everyone that 10100 to 10150 kHz is still reserved for the fixed services, but it is possible to work all zones on 30 meters. (Just read the rules.)

5R, MALAGASY REPUBLIC. 5R8GW and 5R8JS have just received the last of the signatures required to submit their application to the League for approval. F6FNU reports this paperwork is in process and he hopes for League approval soon. Until then, look for 5R8GW on 28450 kHz around 1130z.

FW, WALLIS ISLAND. FO4OA will have a 14 to 18 month assignment in FW-land starting June 21st. There has been no callsign mentioned or QSL info reported.

JARL KYOTO ARC (JA3YAC) DXPEDITIONS TO 3D2/T30. Activity will be 80 thru 6 meters including the WARC bands, SSB/CW/RTTY. QSL all via JA3OIN.

3D2, FIJI. Be looking for 3D2IG (JH3FJG), 3D2TX (JH3TXR), 3D2KT (JI3DLI), 3D2IL (JF3PLF) and 3D2IM (JI3NTS) from August 7th & August 14th-15th.

T30, W. KIRIBATI. Be looking for T30IG (JH3FJG), T30TX (JH3TXR), T30KT (JI3DLI), T30IL (JF3PLF) and T30IM (JI3NTS) from August 8th thru 13th.

KH4, MIDWAY ISLAND. Ted, NH6YK, will be on Midway starting July 2 thru August 20th. He will be there as a Volunteer Bird Researcher, but plans to find time to be active as NH6YK/KH4. Activity will be on 6 and 10 meters SSB. There may be a possibility of satellite operations if equipment can be found in time. More details to follow later.

KH9, WAKE ISLAND. Jim, VK9NS, says that due to the lack of time he is going to use his stateside call, WR1Z, and /KH9 when he goes to Wake Island. Begin looking for WR1Z/KH9 starting June 23rd.

OX, GREENLAND. Wolfgang, DL3LAB, and ED, DK2OY, will be active from here starting June 27th thru July 11th. Both will sign OX/. Activity will be 160 thru 10 meters with a possibility of some operations on the WARC bands. Wolfgang will be active on SSB and Ed will be active mostly on CW. QSL to DK2OY (92 CBA).

PACIFIC DXPEDITION. Andy, G4ZVJ, will sign KH8/G4ZVJ from Tutuila Island (IOTA OC-045), American Samoa starting August 12th. He is also hoping to sign ZK2VJ from Niue Island probably August 26th to September 2nd. There may also be some brief activity as 5W1VJ from Upolu Island, Western Samoa. Activity will be on all HF bands, mostly CW. QSL via G4ZVJ.

S7, SEYCHELLES. Achim, DF3EC, who was signing FR/DF3EC/P from Reunion is now active from Seychelles as S79EC. He will be there for two weeks. Check 21025 kHz around 1700z, and 18083 and 10104 kHz starting around 2130z. CORRECTION: Last week we mentioned Achim was one of the operators with Baldar, DJ6SI, operating from Glorioso. This is false.

T2, TUVALU. Ian, T20AA, is usually a regular on Sundays, 21330 kHz at 1000z. QSL via N4FJL.

V5, NAMIBIA. DK1II will be in Namibia from June 26th to July 24th. He will be active mostly on CW. Check the usual DX frequencies and the WARC bands. QSL to CBA.

VR, PITCAIRN ISLAND. Brian, VR6BX, has been active on 15 and 20 meters RTTY. Check between 0100 to 0330z around 14085 and 21086 kHz. QSL to Brian Young, P.O. Box 21, Pitcairn Island.

ZA, ALBANIA. It has been reported by Martti, OH2BH, that the IARU staff has revisited Albania and new amateur radio training class are being held in Tirana. There will be 15 new hams who will receive their licenses in early July. Martti also reports that Albania will receive their IARU credentials in late June. He hopes/plans to operate from the new Albanian IARU Headquarter's station (ZA1IARU?) during the Radiosport Contest in mid July.

ZK1, NORTH COOK ISLANDS. More information was sent to OPDX (by Steve, AA6LF) on Warwick Latham, ZK1WL. Warwick is indeed a resident and the only ham on Penrhyn Island. He is the operator of the radar and weather stations there. Steve had a chance to meet him. He stated Warwick is a great guy and he was nice enough to let him guest-op from his shack. Unfortunately for DXers, Warwick is more interested in satellites and experimenting than in being an "appliance operator" for the deserving.

Word has it that Peter, ZK1XP, is to be active shortly from here. His length of stay is unknown at this time.

DX TIDBITS..... Bob, KW2P, (of Navassa fame) annouced that he and the same crew would be going to Desecheo (KP5) for and all band/mode operation December 28th to January 4th. They have received the required permission..... Toly, UT3UY, (of D2ACA) is trying to get into 9G and 3V. No other info is available yet..... The HA5BUS operators are resting and have licenses to operate for 14 days from 9V and 9M consecutively, starting June 23rd..... It was reported on the 14236 DX Net that QSL cards for FO0CI Clipperton DXpedition are now being sent out.... QSL cards for the recent OD5RAK operation will be coming around the first part of July. Dwaine, WA8MEM, with NODXA, will be receiving the QSLs to be mailed stateside....

CZECHOSLOVAKIA TO SPLIT IN TWO. FUTURE NEW DXCC COUNTRIES? After 74 years, Czechoslovakia may be divided into two independent nations. The newspaper reports that there is a slight, but unlikely possibility that Czechoslovalia would survive. The split could cause a Czech Republic and Slovak Republic. The two regional parliaments have set the date of September 30 to reach an agreement. Stay tuned!

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

From: R_ARAGAO%BRUNB.BITNET@VTVM2.CC.VT.EDU
Message-ID: <9206241211.AA27543@ucsd.edu>
Source record: 288196

Dear OMs
Recently I measured the power output of my ICOM 02AT using some power
supply voltages and a Bird meter. For 13.8 V from my HF Rig PS I had
about only 3.2 Watt using a well matched antenna. Since the manual
says this should be 5 Watt I woul like to know if the final transistors
are damaged.
Thanks in advance

Hi All,

I am curious to know if anyone is using an MFJ1278 to decode both FAX and SSTV. The problem that I have is that I am trying to decode both modes using MFJ's Multicom software (to no avail)...

Would anyone have a PD (Public Domain) software that can work with the MFJ1278 to decode these modes?

Help would be appreciated,

73 de Doug!

>on the band.

I used to have an Argonaut, 2 watts out on a good day 80 thru 10. I used it portable with antennas just thrown up in trees. If you stayed out of pileups and called it a day when summer thunderstorm static got too bad, you could talk to a lot of stations. 40m was usable in the daytime and 80 was good very late at night. 20 was ok as long as there wasn't a contest. 15 and 10 were fine when they were open.

You could hear a lot more stations than you could work of course. I eventually went to an IC735. With 100 watts I can talk to anyone I hear, provided I stay out of pileups. Since I don't work DX, that's no problem.

Sure! (717) 337-1511 (license inquiries)

They issue Amateur licenses on Tuesdays, and you can call on Thursday to find out if it was issued that week. They'll ask for a last name and zip code (and sometimes a callsign if it's an upgrade.) And that's about all there is to it. Unfortunately, though, I think that all they can tell you is whether it's been issued (and, if so, the call sign). If it's still waiting to be processed, I don't think they can determine where in the pile it is.

73 to you and your daughter!

3892. Nicad information

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-24 15:00:43 UTC
From: hwells.el_segundo@xerox.COM
Message-ID: <"24-Jun-92..7:59:51.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 288204

Here is an article that I put together awhile back that may answer the question regarding Nicads remaining cool during a C/10 charge. And, yes, Nicads prefer to remain cool.

NICAD CELL CHARACTERISTICS

by

Hugh Wells, W6WTU

The operating characteristics of a Nicad cell are very basic in nature. During charge, only current and cell temperature are critical. Discharge may occur at any current rate until the cell terminal voltage falls below 1.1 volts, but the cell temperature rise must not cause the cell electrolyte to boil (gas). When connected in a pack, the pack must be unloaded when the individual cell voltage falls to 1.1 volts to prevent reverse charging of the lowest voltage cell in the pack.

Few applications discharge cells at an excessive high rate where gassing becomes a problem, with the exception of toy electric cars (These are toys for men). Cells designed for this application usually have larger than average plate area and large connecting tabs to support the higher peak current. Cell temperature is kept below the critical value by selecting the cell capacity such that the cell will dissipate its charge before gassing occurs. In essence, the toy car runs continuously with a nearly zero series load resistance allowing the cell temperature to rise near critical just as cell discharge is reached.

The following brief notes will further amplify an understanding of Nicad cell characteristics.

1. Nicads are very easily damaged due to gas pressure caused by over-charging at high charge rates. Unfortunately, Nicads do not have a positive indicator for indicating the state of charge. It is up to the user to estimate the relative charge state. The cell terminal voltage does rise slightly and then drops off at the point of full charge which may be used as a "full charge" indicator during charge. Typically, the charge rate is calculated at C/10 where C equals cell capacity and the 10 represents hours for charging. At C/10, a nominal or normal charge would occur. A fast charge can be accomplished, cell design permitting, by changing the ratio, i.e., 5C/2.

2. Cell temperature does rise at the completion of the charge cycle, particularily at high charge current values, and can be used as a charge completion indicator. At the moment of temperature rise, the charge current must be reduced immediately to prevent excessive gas pressure build-up. Some chargers monitor the cell temperature and reduce the charge current to a small sustaining value. For 500ma cells, the sustaining value is typically between

10-25ma, or just enough current to compensate for the chemical change (internal current leakage). Nicads prefer to remain "cool" because elevated temperatures can cause dehydration.

3. Pulse charging of Nicads is most preferred as it is more efficient than a steady-state current value. Steady state current creates gas bubble formation on the plates of the cell, while pulse current tends to create fewer gas bubbles allowing the charge to be more uniform across the plate area. The charge uniformity is enabled by gas bubbles being moved around due to current pulsations. Bubble movement allows more plate area to be exposed during charge. Pulse charging also creates less of a temperature rise. The charge rate still has to be calculated as a function of C/10 during each charge pulse to determine total charge time (The accumulated charge is equal to the sum of the charge area under the pulse curve).

4. Older style Nicad cells would not accept high charge rates above C/10 and would develop electrolyte seal leakage at attempted higher charge rates. A leaky seal, in any case, means the eventual loss of the cell. Newer cells, as used in most handheld radio applications seem to tolerate high charge rates without developing cell leakage as long as the temperature is controlled (kept low).

5. In the event corrosion around the seal of a cell develops, the corrosion can be removed. Wipe the corroded area with a vinegar soaked cotton swab. Use an ample amount of liquid and dry the cell with a tissue. Keeping the cell clean allows it to be used until it fails completely. Take note that weeping cells can cause corrosion problems if they are not inspected and cleaned regularly.

6. Discharge of a Nicad is critical only if the cell is under a load. When loaded, the cell voltage should not be allowed to drop below 1.1 volts which is just over the edge of the discharge end of the curve. Allowing the cell to drop to 1.0 volt or less while under load may cause permanent plate/electrolyte damage. The result would be a loss of cell capacity. Of course, a loss also takes place naturally with age which limits the number of charge-discharge cycles the cell is capable of supporting before it is exhausted.

7. Unloaded cells may be stored almost indefinately and allowed to discharge to whatever cell terminal voltage the cell can maintain on its own. When putting a previously stored cell into use, charge the cell, at least the first cycle, at C/10 for 12-14 hours. Shelf life of a cell is usually a function of how fast nickel whiskers develop internally that can short the cell. Two methods have been proposed as a way of extending cell life when whisker formation is of concern. a) Cycle the use of the cell/pack periodically. It is believed that the rate of whisker formation is reduced when cells are charged and discharged periodically. b) Allow the cell to sit on the shelf as long as needed and if a whisker short should occur, blast it away with a high current pulse from a charged capacitor or other source. It has been observed that once whisker growth/shorting begins, it can not be permanently stopped.

8. It has been observed that the terminal voltage across a charged Nicad cell will increase as the cell ages. Using this observation, the life expectancy of

a cell can be evaluated and monitored. As an example, a new/fresh cell will exhibit a terminal voltage of 1.25 volts while an old cell will exhibit, say, 1.5 volts. It is believed that the cell dehydrates with age and the rising voltage is a function of the increase in cell impedance.

9. Over the years, there has been many a discussion about Nicad cell memory. Yes, older style Nicads do have a memory function which can be aggravating if not understood. Simply stated, if the cell is used only over a small portion of its total capacity for at least 60% of the cycle time, the cell capacity will assume the more limited capacity value. To avoid the tendency of a memory condition inhibiting use, allow the cell/pack to be fully charged and discharged at least 60% of the total charge-discharge cycles. If in doubt about what is a full charge or what the discharge condition happens to be, then allow the cell/pack to fully discharge, unloaded when below 1.1 volts/cell, about one out of ten cycles. The charge rate from full discharge should be C/10 for 12-14 hours to cause as much chemical conversion to occur as possible. Charging at twice that value is not a problem as long as the cell doesn't start out-gassing (Monitor the temperature and taper off the end charge rate).

Many hints and kinks have been published regarding the nature and care of Nicads and all point to the fact that Nicads require user TLC to obtain long cell life. The bottom line is that the user must pay attention to how the cell is being treated.

Actually, that won't help you much, unless by moving you to the top
you get keyed in to an earlier mag_tape. The staff in Gettysburg, key your 610
information in and either weekly or when the tape fills, whichever is earlier
(and it is amlmost ALWAYS just weekly) they send the tape to the main FCC
office who cruches the calls (and the computer sorts the entries on the tape
by ZIP code and last name, in that order! for each set of calls.. just if you
were curious..) and then sends another tape to gettysburg for database
updating.. (hence the lags... they don't load a tuesday tape until thursday..
onto their info-system.. but the liscences have been printed and mailed)..

Michael,

I've been in Prague, and either English and German will suffice.
I survived quite well on one year of night school German, although
I was stretched to the limit of understanding many times!

I think the Eu repeaters have some sort of tone burst and
different splits that we, but some one more knowledgeable than I
can provide that.

I'll be interested in your "review" of Czechoslovakia when you
return. I've been considering a return visit in the next year or
two and have been reading about the growing number of Americans
"hanging out" in Prague. That may or may not be a good thing, but
it surely is a *lovely* city!

No we shouldn't. And while we're at it, we should eliminate arithmetic from the elementary school curriculum and teach them to use calculators instead. And for highschool/college students, why teach them calculus when they can use Mathematica?

Don't expect the high quality documentation you got with the Ramsey.
I'm serious, the Hamtronics docs consist of a badly photocopied
schematic and a short note that says solder the parts on the board. :-(

3900. RS 12/13 Skeds for FD weekend

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-24 17:15:24 UTC
From: randyh@gvgadg.gvg.tek.com
Message-ID: <4756@gold.gvg.tek.com>
Source record: 288216

I am making some plans to use Oscar for Field Day and I need some
schedule information. But before that.

I bet most amateurs don't know that they can make a satellite contact
using their hf transceiver. Last night I worked through RS 12/13 using
mode K. Mode K is 15 meters up and 10 meters down. I was using a tri-band
beam running a 100 watts. Signals were strong. You need to figure out how
to run in split mode, using different bands.

The Transponder Frequenies and Modes are:

RS - 12 RS - 13

Mode A uplink 145.910 - 145.950 145.960 - 146.000
downlink 29.410 - 29.450 29.460 - 29.500
beacon 29.408 or 29.454 29.458 or 29.504

Mode K uplink 21.210 - 21.250 21.260 - 21.300
downlink 29.410 - 29.450 29.460 - 29.500
beacon 29.408 or 29.454 29.458 or 29.504

Mode T uplink 21.210 - 21.250 21.260 - 21.300
downlink 145.910 - 145.950 145.960 - 146.000
beacon 145.912 or145.958 145.862 or145.908

Mode KA uplinks 21.210 - 21.250 21.260 - 21.300
145.910 - 145.950 145.960 - 146.000
downlink 29.410 - 29.450 29.460 - 29.500
beacon 29.408 or 29.454 29.458 or 29.504

Mode KT uplink 21.210 - 21.250 21.260 - 21.300
downlinks 29.410 - 29.450 29.460 - 29.500
145.910 - 145.950 145.960 - 146.000
beacons 29.408 or 29.454 29.458 or 29.504
145.912 or145.958 145.862 or145.908

These are non-inverting transponders, so if you set your transmitter
10KHz up from the bottom, you will come out about 10KHz +/- doppler
on the receive side.

So, I was wondering if anyone knows what modes RS 12/13 and
RS 10/11 will be in over this weekend?

So give it try!!

Randy

>KB2OOA

Yes, good luck with your daughter's ticket!

On an administrivia note, I wonder if it is desirable to "bother" the FCC by calling them, unless of course your license is seriously overdue (3 months or more). The FCC (pretty much) does the license processing fairly efficiently and dedicating any significant fraction of one person's manpower (I think the PRB licensing department is at about 2.5 manning) to answer phones may detract from that. Average processing time for a license is 6-8 weeks, you can wait that long (yeah, I know, easy for ME to say :-).

Whether or not the FAQ should contain phone numbers and addresses for the FCC was something the FAQ coordinators mulled over for a while. We decided (and apologies if this is a snobby perspective) that it might not be desirable to make it easier for the FCC to get burdened with a lot of communications with the general public. We decided instead to publish the contacts for the ARRL and encourage those on the net to telephone and send mail to the League.

Flames to me. Meaningful FAQ feedback to hamradio-faq@uts.amdahl.com.

3902. Ancient Video Tape Format Help!?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-24 17:34:48 UTC
From: William=E.=Newkirk%Pubs%GenAv.Mlb@ns14.cca.CR.rockwell.COM
Message-ID: <9206241734.AA21590@ucsd.edu>
Source record: 288218

(well, the first route said it couldn't deliver this message so we try again and hope it's not lying to me...)

One of the senior guys here at work is retiring the end of the week and one of his co-workers came up with a spool of "Panasonic Video Tape For Helical Scan Video Tape Recorders", type number NV-P71. Probably 2400 feet of 1/2 inch tape on a 7" spool.

Checking with the local TV places, everyone junked/scrapped/salvaged their old 1/2" reel-to-reel equipment years ago (the last time I saw one was like 20 years ago in high school) so it's not going to be possible to get the tape viewed in time to find any memorable moments for the dinner saturday (unless someone in Orlando or Melbourne/Cocoa/Titusville/Vero Beach areas has one of these beasties and we can get it connected to a modern VTR...)

My curiosity is finding out what type of machine was used to make the tape to start with. I recall that there were lots of 1/2" reel-to-reel formats and that they weren't "universal" like VHS SP or Beta II. Maybe someday we'll come across a working one and maybe remember to view this sucker. I'm dimly recalling that the machine type numbers were like NV-3000 or NV-8000 or so.

Thanks,

Bill WB9IVR

Oops! I hope I haven't committed a faux pas by posting the phone number. But it's pretty easy to get - In my case, I wanted to find out about a long-overdue license, so I called information in Gettysburg and asked for a phone # for the FCC. They had a couple listed, including one specifically for licensing inquiries. And, judging from the folks I've talked to (I had to call a couple of times - turned out it really was lost in the mail!) this is pretty much standard procedure. Of course, I wouldn't recommend calling every week from the time you pass your test, but if it's been a while, it's nice to know where to call. Hey, I'm waiting on an upgrade myself - last thing I want to do is slow things down! :-) So if anybody copied that number down, please save it for an emergency...or at least let's not bog them down unnecessarily.

The most current issue of _Science PROBE!_, a magazine for the
amateur experimenter has an article on whistlers and plans for
building and using a simple (and cheap) receiver.

I can't help the name of the magazine, but the content is
interesting.

Daniel Blakley was looking for the address, and here it is,
with phone number:

Circuit Board Specialists
P.O. Box 951
Pueblo, CO 81002
719-542-4525

Because they've made boards for so many projects, they don't have
much of a catalog. If you call or write about a specific item or
items, they'll quote you a price. Their delivery time tends to be
a little long....

Fred is on vacation for a bit (went out of the country!), so he will probably NOT be replying for a while :-) Send him email at the address noted in my .sig for the callsign project, and I'm sure he will reply when he gets back...

(Still waiting for NTIS to send the tape for this round of the project. On Tuesday (6/16/92) they said they had just gotten the FCC tape and would have my tape sent out in the next day or 2 (via ups). Which means that it should arrive today or tomorrow....

Not exactly... The honorable Lowell Weicker VETO'ed that bill legalizing the use of RD's. The House and Senate in its infinite wisdom wisely overrode the governors veto. After imposing a state income tax on the residents of the state the politicians are out to appease the general masses anyway they can.

One rep said "It's only fair that motorists be able to use the same technology that the state police use" which sounds kind of funny coming from a politician. But they are looking for any support they can get.

From: lhurder@arrl.org
Message-ID: <201@arrl.org>
Source record: 288108

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
.-
1. Printouts of Volunteer Examination session
opportunities in his/her area.
.-
2. Listings of Amateur Radio clubs in his location.
.-
3. Helpful promotional material about the Amateur Radio
Service.
.-
The already-licensed individual might well be interested
in another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely
points out how the ARRL National Traffic System and the
ARRL Amateur Radio Emergency Service function as a
cohesive unit to provide the maximum support to the public
both in times of disaster as well as "normal" times.
.-
To obtain either of these free ARRL services, please
provide me with:
.-
A. Your name
B. Your mailing address
C. A Specific request for either of the two services
above.
.-
Best 73!
.-

3912. Re: Improving CW Speed

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-24 20:18:28 UTC
From: dpt@cadre.com
Message-ID: <1992Jun24.201828.8105@fripp.ri.cadre.com>
Source record: 288227

The best way I have found to improve your conversational speed is to think about code in terms of words rather than letters. Read the words in your head rather than writing down characters. If you miss a word, let it go - Don't stop and think about what you missed just concentrate on recognizing the next word... After awhile, you will start to recognize commonly used words immediately. For words that are uncommon, try "visually" drawing the sequence of characters in your head until you recognize the word... Beyond that, I think the key to improving your speed is to log as many QSOs as you can using speeds slightly faster than you can comfortably copy. At some point you will find yourself sitting back (without a pen) or walking around the room automatically reading code in your head. Thats when CW gets real fun... It's more like speaking with someone on the telephone...

3913. Can anybody identify this?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-24 20:58:20 UTC
From: sadler@carina.unm.edu
Message-ID: <h0rlzqk@lynx.unm.edu>
Source record: 288130

Well, this is probably the wrong newsgroup for this, but I couldn't find one that seemed appropriate. I found what appears to be a radio headset at a surplus store the other day and couldn't resist (I thought I might be able to use it in an airplane if I could figure out what it is).

It's called an EFI TRANSIPHONE. I called a few places named EFI in the 800 phone directory to no avail. Physical description follows:

Beige headset with attached microphone. On the mic side externally it has two phone jacks labelled "BATT." (for battery I assume) and "MON.", and a slide switch labelled "on/mic". On the same side internally it has (among other things) a chip labelled CA3086 (RCA), a battery connector, and a mercury switch.

On the other side externally it has a volume control and a tuning knob. Internally it has a ferrite pick-up, a tuning capacitor and a chip labelled LN372N.

Does anybody have a clue as to what it is, or perhaps some leads as to how I might get in touch with the manufacturer?

If you know of a better group to post this too, tell me that as well! Probably ought to send replies by E-mail, since this surely isn't of general interest. :-)

>
>Gary KE4ZV

>
How well Rick's transverter works depends on what input MMICs you
use. If you have a real noisy 902 band, which isn't unusual in
some places, you really need a transverter built like a well designed
40 meter receiver. Solution--don't use ANY MMICs in front of the mixer.
sure, you will probably have a 13 dB or so NF, but chances are, there
is enough background noise on channel that it doesn't really matter--just
like 40 meters. If things are really bad, you may have to add some sort
of cavity or interdigital filter, but this would be needed with just about
any transverter.

Even if you don't modify Rick's board to use +17 dBm mixers, I suspect
that people using early versions (1987) of the 56 kb modem will have
trouble with the modem front end crunching before the transverter.
The schematic I am looking at just has a 3N204 mixer with a PI network
input matching section--not exactly what I'd call high performance.

To fully take advantage of an SBL-1X mixer with a 10 dB post amp, you
really need something with a +15 dBm 3rd order input intercept and a 3
dB NF (for those of us accustomed to 500 Hz BW RX specs, this is a
108 dB dB DR!). Not surprisingly, the VHF contest stations use the
best HF rigs they can get their hands on for IF radios. I suspect
that even the latest 56 kB modem doesn't come close to making an
SRA-11H mixer worthwhile.

Incidentally, you might wonder why I haven't published anything on these
high level mixers. To be honest, they really are lab curiosities. You
are unlikely to see any benefit--simply because you need to clean up
the broadband/phase noise of the interfering transmitters to see
the advantage. For the few who can clean up those "other" transmitters
on the hill, great, but most of us can't. We are lucky just go get our
stuff up there.

A way to make Rick's transverter exceptionally clean is to spend a few extra $$ and get crystals around 190 MHz instead of around 95 MHz. Not needed in most cases but this sort of stuff pleases some people...
To get the oscillator running at 190 MHz, use 5 turns of #28 for L2 and 9 turns on a T-20-6 core for L1. The 903 LO is probably the worst of the series because it has an x 8 multiplier in one stage, the other transverters are more conservative. Also, the published biasing resistor values are marginal at +12 volts--they really should be changed if you intend to run off 12 volts. My unit has 430 ohms for the MAR-6, 120 ohms 1/2 watt for the 1104, and 220 ohms 1/2 watt for the MAR-3s in the LO chain. Guess when Rick said 13.5 volts he meant it...

now if Rick would just come up with something for 24 GHz...

Finally, it pays to investigate all the bands and see which are quiet and which aren't. Instead of getting expensive filters, it may make more sense to use a band that doesn't need any. Perhaps the best way to evaluate a band is with a low level signal source/linear transverters with an AM or SSB receiver and a set of attenuators. Combine the low level source with the attenuated input from an antenna and see how little attenuation you can use and still hear your source. Of course some noises like radar are intermittent and easily missed.

3917. Need Azden PCS-2000 mic connector

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-24 22:25:34 UTC
From: daveh@frackit.UUCP
Message-ID: <621@frackit.UUCP>
Source record: 288143
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,rec.radio.shortwave

I have an Azden PCS-2000 2 meter FM rig that I would like to use for packet radio. The microphone connector is a 12 pin type that is unavailable from either Radio Shack or the local electronics supply house. The 12 pins in the connector are arranged in three rows of four each. I called the Azden dealer in Georgia, but they no longer have any connectors or microphone cables with connectors in stock. The operator's manual is very little help. It lists p/n EC-80 which is the cable with connector, but no part number or manufacturer for the connector. Amateur Wholesale Electronics was the only source of parts listed in manual I have. Does anyone on the net know where I could obtain the female mic connector, cable with connector or even the whole microphone for this rig?

I used to know a guy that could read paper tape. I thought that was pretty bad at the time. That was at least straight ascii. Not too much paper tape around these days: I wonder if they still make the stuff?

I like the idea of requiring the ability to decipher 1200 bps AX.24 packet by ear. Or how about reading a 3.5 high density floppy - you mean you can't see magnetic flux lines?

3920. Re: 56K radio technology [was Re: Another letter to Gary (a defense)]

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 02:03:23 UTC
From: news@cunews.carleton.ca
Message-ID: <1992Jun25.020323.17414@cunews.carleton.ca>
Source record: 288138

|From: gary@ke4zv.uucp (Gary Coffman) writes:
|>What is the minimum acceptable channel spacing of the 56K modem ?
|The modem is 70 kHz broad and operates on 100 kHz channel spacing.
|Gary KE4ZV

If you can guarantee that the carriers on the adjacent channels are equal level at your rx sites you would probably not have any problem operating at 100 kHz channel spacing. If you are like us in Ottawa, getting all the carrier levels received at the main repeater site to be equal is quite difficult (and we only have one channel at the moment). We have seen level differences of over 30 dB - enough difference that the stronger signals are received without errors, when collisions occur.

If the carriers are equal level, and you have 100 kHz spacing, you will still have some degradation - something in the order of 2.5 dB. If the levels, over time, start to diverge and one system is operating 10 dB higher than the other - at 100 kHz offset - the lower level system will be degraded by more than 10 dB (if both carriers are being rxed at the same time).

I did some lab measurements on my 56 k modem last year and had a paper of the results in the Computer Networking Conference. The title was (if anyone wants to check it out) "Digital Networking With the WA4DSY Modem - Adjacent Channel and Co Channel Frequency Reuse Considerations".

I also saw the GRAPES video about the WA4DSY modem recently and Dale says in the video that the modem's "theoretical" channel spacing is 150 kHz. This seems to have been proven out by the measurements I did.

For interest here is what happens when you move 2 @ 56kHz carriers closer together:

Table 3
Wide Band Data Adjacent Channel Interference with C/I=-10 dB

Offset (kHz)	BER	BLER	(Eb/No)eq	Degradation
200	1.80E-05	0.42%	18.0	-0.5
190	5.00E-05	1.10%	17.5	-1.0
180	1.70E-04	3.70%	16.9	-1.6
170	5.90E-04	11.00%	16.2	-2.3
160	1.00E-03	17.00%	15.8	-2.7
150	1.80E-03	23.00%	15.4	-3.1
140	3.66E-03	33.00%	14.8	-3.7
130	7.70E-03	68.00%	14.1	-4.4
120	5.70E-02	99.00%	11.6	-6.9
110	2.00E-01	100.00%	8.9	-9.6

Where C/I=-10 means that the adjacent channel carrier is 10 dB higher
than the carrier you want to receive.

Conclusion:
If you have alot of discipline or automatic power control, then 100 kHz will
probably work without any problem. If not, then you probably won't get the
performance you are expecting.

I believe the reason there is a problem closer than 150 kHz is that the IF
filter is somewhat wider than 100 kHz and tends to let through alot of
energy from the adjacent channel.

> Who makes an R-5 and R-7? Are these part numbers of some brand?

Cushcraft. They are a 5 band (10-12-15-17-20) and a 7 (add 30-40)
band vertical. They require no radials (other than the whiskers
that come with it). The R7 is about 27' tall but is light enough that
one person can pick it up. I helped a friend put one up. He and
someone else put it together and I placed it in a Radio Snack roof
tripod. It seems to work pretty well. I'm thinking of puting one
up for myself.

Yea, but how does a R5/R7 perform to a plain old quarter wave vertical, ground mounted with radials? Anyone ever compare them?

We use the same frequencies you do, except we haven't lost 220-222 MHz yet. Carry a copy of your US license with you. Use the same frequencies you do at home. (Bandplans are the same, basically). Canada and the US have a reciprocal licensing treaty, so we can both use our rigs in the other country. The 220 MHz band up here isn't used nearly as much as farther south, though.

What kind of touring bike is it?

3926. Someone with a 10 - 10 directory?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 05:02:21 UTC
From: rrw@naucse.cse.nau.edu
Message-ID: <5222@naucse.cse.nau.edu>
Source record: 288141

Through a wonderful bit of planning, I seem to have gotten ready for a long drive, planning to enjoy doing some mobile operation, but have forgotten to bring along my 10-10 number. I wonder if someone with a directory can look it up for me? I seem to have left it at home in Colorado.

I can't recall right offhand which call I had it under - it could be WB5ELR, WB0IMC, or my current WB5KXH.

I'd greatly appreciate it.

THANKS!

3927. WARNING: Potential Major Solar Flare Warning

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 07:34:54 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.709457694@honte>
Source record: 288147
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

POTENTIAL MAJOR SOLAR FLARE WARNING

ISSUED: 07:00 UT, 25 JUNE

/\

PRIMARY CANDIDATE FOR HIGH SOLAR ACTIVITY : REGION 7205 (N11W62 @ 25/00Z)

ESTIMATED POTENTIAL MAGNITUDE OF ENERGETIC ACTIVITY OVER NEXT 7 DAYS						
DAYS	C5.0	M1.0	M5.0	X1.0	X5.0	>X12.0
1( )P	100 %	70 %	40 %	5 %	1 %	0 %
3( )P	95 %	50 %	40 %	5 %	1 %	0 %
5( )	WLT	WLT	WLT	WLT	WLT	WLT
7( )	WLT	WLT	WLT	WLT	WLT	WLT

DAYS = Number of days (from present) into the future (1, 3, 5 and 7 days).
(+) = Primary candidate region expected to GROW and DEVELOP.
( ) = Primary candidate region expected to STABILIZE.
(-) = Primary candidate region expected to DECAY and SIMPLIFY.
(x)P = Possible proton and/or PCA threat. (x) may be one of (+), (-), or ( ).
(x)G = If a favorable major flare develops, a moderate to high probability exists that the event may be geoeffective.
xx % = Probability of activity equalling or exceeding the given x-ray class sometime over the next number of DAYS.
WLT = Data not applicable due to the West Limb Transit of the target region.

The above chart should be used as a guide only. It represents anticipated levels of activity based on current projections of region development. Actual conditions may, of course, differ from these projections.

SYNOPSIS:

Region 7205 remains notably large and complex. Although the region has slowed in growth over the last 24 hours and has continued to structurally evolve, the region remains impressively complex and potentially volatile. Recent observations suggests the region may be destabilizing. Given the configuration and potential volatility of this region, a warning for possible major flare activity is being released. Although the threat is not particularly significant at the present time, there is a chance a major event or long-duration (potentially proton-capable) minor M-class event could be

observed prior to the transit of this region beyond the west limb. An associated injection of protons into the near-earth space environment at greater than 10 MeV cannot be ruled out and should be considered possible for the duration of this warning.

This warning will remain active until 27 June inclusive when it will be allowed to expire, unless developments warrant early cancellation.

In article <9206241748.AA23210@ucsd.edu> P.Lucas@unixa.nerc-swindon.ac.UK (Pete Lucas) writes:

Interesting comments on the USA's continued use of VHF TV;

I'd like to add some minor clarifications to Pete's posting:

theres little VHF TV still in use over this side of the pond. I think theres still a bit of it in France & Norway (I remember seeing maps showing no-go zones for 50MHz use in France).
Most European TV is now UHF, channels 41 to 68 (from memory thats 470 to 860MHz). The old 41-68MHz and 174-216MHz VHF TV channels have been reassigned to trunked mobile-radio services. We never had TV in the 68-88MHz band; this is used for mobile radio. We never had mobile radio in the 30-40MHz band though
.

TV Band I (41-68) is almost dead by now. There are several transmitters in use both in Sweden and Norway but both countries do have a 50 MHz ham allocation, although with some restrictions. In Sweden they still have to apply for special permits. Band I isn't used for trunked radio on the continent (it's mainly on 400 MHz), I think I have heard rumors of digital BC radio on Band I in the future?

On the continent, Band III is still very heavily occupied by TV transmitters and I don't think it will be reallocated until 2010 or so.

Also 30-40 MHz is widely used for mobile radio e.g. in France and Germany. Here in Finland it was abandoned about 10 years ago because of strong Es induced QRM from Central and Southern Europe.

If my mind serves me right the UHF channels are 21-68 in the 512...860 MHz band. So we don't have cellular on 800 MHz, it's 890...960 MHz (TACS in the U.K.,Austria, Italy and Spain, NMT in the Nordic countries, Switzerland and Holland and the pan-European GSM system will also operate on 900 MHz. And of course we don't have the 902 MHz ham band...

Some Eastern European (ex-Soviet-bloc) countries used 70-85MHz for FM broadcast radio. Radio Gdansk (Poland) on 70.31MHz is a good indicator of meteor-scatter, even though it is smack in the middle of the British 70MHz ham-band.

The OIRT BC band is 66...73 MHz. They are now shifting to 88...108 MHz following the decline of the Soviet Bloc.

Maybe if the US VHF TV network is eventually closed down, you may be lucky enough to get a 70MHz band? It would go some way to making up for the loss of 220MHz! Us Europeans never had 220MHz in any case (and our 2-meter band is only 144-146MHz.... curses, foiled again!).

How come they didn't get a ham band around 210 MHz in the U.K.?

European standards are a mess! We use Phase Alternate Line (PAL) for color TV on UHF, with the exception of France (who use SECAM - dont know what it stands for). FM broadcasting, as i mentioned previously, is split into ex-Soviet-bloc 70-85MHz and 'Western Europe' on 88-108MHz. But there was an allocation around 100MHz for mobile radio (Police etc), and East germany used to use 88-108MHz for FM radio even though it was in the Soviet bloc! (apparently when the time came to decide, they hoped Germany would be re-unified sooner ratehr than later, so chose the 'Western' standard - a decision which, in the light of recent events, was very far-sighted!).

I suppose the U.K. is the only place where they did actually have mobile communications at 100 MHz. Here the 100...108 MHz band used to be occupied by transportable BC links between the ENG vans and the studio and also all kinds of control and telemetry. Now it's used for BC transmissions as it was intended.

Hi!
Can anyone tell me about the YAESU FT-101(ZD?). Is it a decent
radio? A friend of mine was cleaning out his shack and told me
to make an offer. What do you suppose it is worth?

Any help would be appreciated.

At high VHF our monthly power bill is $10,000. At UHF a maximum power station with *almost* as good coverage has a power bill of $50,000 a month. Low VHF stations with equivalent coverage have power bills under $3,000 a month. In today's soft broadcast market, those figures aren't chicken feed.

> Channels 7-13 don't get hit by E-skip as often, but
>moving even those channels to higher frequencies would be a
>good decision because television tuners and antennas could be

UHF and VHF tuners are separate anyway.

Broadcasters use VHF for the same reason that 2 meters has better area coverage than 70 cm. The longer waves refract around obstacles better. Most of a broadcaster's grade A coverage is not line of sight.

Source record: 288152

Friends--

Now that it has been out for awhile, I am wondering what the general verdict is on the Yaesu 990. (I have a Kenwood 440SAT and I am thinking about trying to trade up.)
The review in CQ was very positive, as was the review in some British pub I picked up in the store. QST was generally positive, but had a significant number of nits to pick. From twiddling the knobs in the store, I find it to be very easy to use, with an extremely quiet front end.
But what's it like in actual use? Specifically, I am wondering how people think it compares to the Kenwood 850 and the ICOM 765 (about which QST could find nothing wrong, but which is now several years old).
Also, any thoughts on the internal versus the external power supply since the 990 now comes both ways.
Thanks for any thoughts.

Well, for what it's worth, I have used both the Hustler 4BTV and the Cushcraft R5 (my current antenna) in similar mounting configurations, but at different QTH's. Here's a brief review:

Hustler 4BTV: For those who don't know this antenna, it is a four band (40, 20, 15, and 10m) quarter wave length trapped vertical. It requires quarter wave length radials or a ground plane. The vertical part of the antenna is about the same size as the R5. At my last QTH it was mounted on a mast attached to the chimney of my two story house. I had 4 quarter wave length radials for each band (a total of 16 wires) that were spread out and attached to various points on the roof and to trees and things in the backyard. The radials sloped downward somewhat from their attachment point at the base of the antenna (BTW, sloping the radials raises the feedpoint impedance somewhat, giving a better match to 50 ohm coax). Results discussed below.

Cushcraft R5: At my current QTH the R5 is also mounted on a mast attached to the chimney of my two story house. The R5 is an electrical half wave antenna and does not need resonant radials. (Those "whiskers" are supposed to act as a shield current choke.) Much more attractive mounting than the 4BTV. Actually, with the location of the chimney on my current house, I could not spread the radials around, thus my choice of the R5 when I moved.

Comparision: On the 20 thru 10 meter bands I have noticed very little difference in performance between the two antennas. I am a casual DXer and I worked about 180 countries with the 4BTV and I have perhaps added about 40 more with the R5. I would, however, give the edge to the R5. I can pretty consistently work a DX

station in a medium to big pile-up with just 100w and the R5. I used to have to turn on the KW afterburner more with the 4BTV. But that's kinda subjective. The big plus for the 4BTV is 40m. There is a BIG difference in favor of the 4BTV over my current 40m dipole (up about the same height). I think that is to be expected: a vertical should be better for DX than a low dipole. I would spring for an R7 because of its 40m capability, but I don't want to pay the bucks and the hassle of putting it up right now.

That was a little long for 2 cents worth of opinion, but the bottom line is that the R5 is just as good, if not better, than your plain ole quarter wave vertical (more $$ tho!!). The R7 *should* be an excellent antenna on 40/30 compared to dipoles mounted in your typical way (low in electrical height) and just as good as other verticals.

3939. Re: Kit references - Hamtronics

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 14:52:43 UTC
From: znha@bnr.ca
Message-ID: <1992Jun25.145243.21747@bcrka451.bnr.ca>
Source record: 288157

I've built, and use, the 450 receiver and transmitter in a repeater (ve3gsd).
The receiver worked the first time I turned the power on--but hang on a moment--and
the transmitter worked after replacing a bad interstage coupling capacitor.

The tune-up directions are not all that good. The transmitter finally put out
what you'd expect (>2W) after the indulgence of a good friend (thanks, Harrie ve3hys!)

The receiver never had stellar performance. Harrie and I achieved 0.3uV for 12 dB
SINAD, but only after reworking the bias stage on the rf amp. A couple of years
later, due to a power glitch, I wound up replacing most of the transisters in that
receiver (tx no problem. why? Dunno!) and that's when I found out that hamtronics
had shipped the wrong transister!

The spec called for a nec21937, which maps to a 2N (JEDEC) part ending in 69;
hamtronics had shipped a part that was labelled with a 39! Again, with the help
of another good friend, the proper nec part was acquired. (California East Labs
makes nec parts, for those interested...) Lo and behold, with bias circuit restored
as on schematic, and sensitivity climbed to the claimed 0.25 uV for 12 dB SINAD.

Moral of the story: hamtronics kits work not too badly, and are maintainable, but
just because a part fits in a hole, doesn't mean its the best part FOR that hole. :-c

73, Gord.

P.S. I've also had to replace one tripler (2n5179) twice. It lasted only 2 years.

3941. 20 Meter Fire

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 15:09:34 UTC
From: NELSON_M%athena@leia.polaroid.COM
Message-ID: <9206251508.AA23753@ucsd.edu>
Source record: 288155

As we approach Field Day weekend, I hereby submit a cautionary historical article. We must all be careful not to overtax our most popular frequencies this weekend, lest a similar catastrophe repeat itself.

FIRE DAMAGES 20 METER BAND

The phone portion of the 20 meter band was hit by a freak fire last week that destroyed over 10 KiloHertz, according to FCC Special Frequency Engineer, Marvin Larpsnogg. Apparently the fire originated on about 14.280 MegaHertz following an unusually long series of QSOs by an undetermined number of California stations running very high power and extreme modulation compression. Several A0 carriers were observed at the same time and may have contributed to starting the blaze. "We had a hell of a time putting the fire out," said Larpsnogg. "Shutting down the propagation generators did no good at all. The fire just spread up and down the band," he went on, "so we had to turn off all the HF ham bands from 40 through 10 meters to smother the flames." Finally, after nearly three hours, the FCC had the fire under control. Most HF bands were back to normal use the next day; however, 20 meters will be closed for several weeks while the frequencies are being refurbished. When notified of the fire, the League of Radio Relaying Americans cancelled all 20 meter DX contests until further notice. According to League spokesperson Sandy Ampersand, the 20 meter fire was the worst such incident since the famed 5 meter holocaust completely wiped out that band for all time over 40 years ago.

Talking of Norwegian Band I TV, I remember 2 years ago sitting in the base shack of a Polar Expedition in Severnaya Zemlya (part of UA0), off Northern Siberia, watching flickery pictures of the Norwegian station coming through via some form of Arctic E most evenings. It was here that Lawrence, GM4DMA, opeerated on 50MHz as UA0/GB4MSS giving the first QSOs on that band from the then USSR. The Norwegian TV gave an idea of when there may have been propagation, usually to Finland and possibly Sweden. Maybe someone on the group in those areas heard the beacon which was operational for a few weeks on 6m? I think a couple of OH2/3s were worked.
Lawrence had apparently sat watching the little TV in VE8 (Ward Hunt Island) when he was there a couple of years previous, which just shows how interesting Arctic propagation can be.
The TV rx was left with the officer of a certain Soviet ministry as a swap for a hat when the expedition was over, so no doubt he's fluent in Norwegian now.

Why on earth would anyone put 30 MB of operating system on a computer to use amateur radio. We have been a beta site for 2.0 for quite some time and still can make needed parts of it work, esp. TCP/IP.

3948. SkyLoop Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 17:58:34 UTC
From: boyd@afsp.b17c.ingr.com

I have seen a lot of comments on vertical antennas for HF. Has anyone tried a full wave loop placed horizonal above the ground...also called SkyLoop? I would like to know the good and bad of the SkyLoop, performance, etc. Particulary how it compares with verticals and yagis.

Thanks!

Stan KC4ZGF

3949. NEW HAM SOFTWARE

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 18:08:17 UTC
From: lairdpg@lub001.lamar.edu
Message-ID: <1992Jun26.110817.1274@lub001.lamar.edu>
Source record: 288112

New HAM Software being released soon. Software is RGRAM27. This software will allow and handle NTS message Traffic and allow you to generate messages (RADIO-GRAMS) for delivery hardcopy, via Packet, and to keep track of messages sent and messages delivered. This new software will be using the ARRL message format. Author of the Software is N5UYH - P. Laird. Beta sites will be selected soon and the shareware version will also be available in about 1 month. If you are interested in becoming a Beta Site for this new software, please E-mail Phillip at LAIRDPG@LUB001.LAMA.EDU

The shareware version will be limited and generally slower than the registered version which will be available for 15.00 US funds. When the shareware version is released, it will be available for downloading in Texas at the Alpha Site.

I use OS/2 on my computer to do many things... like programming... running
DOS applications, etc.... I also happen to be a ham radio operator... and would
like to know if anybody else is using OS/2 with ham radio.

3951. TWO ELEMENT BEAMS

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 18:37:38 UTC
From: nfunamura%mis2.DEcnet@nuwes-lll.navy.mil
Message-ID: <9206251836.AA12671@ucsd.edu>
Source record: 288167

The ARRL Antenna Book has some discussion/curves for two element beams. It shows that the highest gain obtainable with two elements is with a spacing of .06 lambda. At 20 meters this is 4.2 feet! It also shows that the radiation resistance is very low...but the 4.2 feet spacing is very attractive from the standpoint of construction, i.e. can be achieved by using only two supporting poles and a 4.2 feet spreader. Would like to try using this for Field Day. I have not seen anyone using this scheme and would like to hear from anyone who has ACTUALLY TRIED IT. How much of a problem is the low radiation resistance, will a gamma match work, what matching scheme was used etc. etc. What results were observed? Is it worth trying? If nothing else a more conventional spacing will be used, but it sure would be nice to be able to get by with only two poles.

3952. Public Information Officer job description

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 18:46:42 UTC
From: lhurder@arrl.org
Message-ID: <204@arrl.org>
Source record: 288078

The ARRL Field Organization is in need of amateurs in EVERY state who have contacts with the media. You need little more than an ability to find out the mailing addresses of media outlets in your area to become a productive (and very necessary) part of the overall public information / PR effort for Amateur Radio.

Here's some guidelines to help you decide if you'd be interested. E-Mail me if you need an application.

4.4.5 Public Information Coordinator (PIC)

The Public Information Coordinator (PIC) is the Section's expert on public information and public relations matters. The PIC is also responsible for organizing, guiding and coordinating the activities of appointed Public Information Officers (PIOs) within the Section. If you choose, you may delegate to the PIC the authority to issue and cancel PIO appointments. He will work with Affiliated and Special Service Clubs to assist with their related public relations activities. Usually, the PIC will be located in, and have access to, significant mass media centers within the Section.

The PIC will act as a public relations advisor to the Section Manager, keeping the SM informed on specific needs and opportunities, developing and recommending appropriate programs and projects for the Section. He will assist the Section Manager and Division Director in the preparation and dissemination of communications throughout the Section.

The PIC will seek out and develop significant stories about the Amateur Radio Service and will promote their dissemination in all available media. To contribute to the distribution of these stories, he will -- in conjunction with the efforts of his PIOs, establish and maintain personal contact with those in the media throughout the Section.

The PIC will promote the distribution and airing of ARRL public service announcements and other audio/visual material, and will encourage, organize, and conduct public information/public relations sessions at conventions and hamfests.

With the assistance of the Section's Public Information Officers and officers of Affiliated and Special Service Clubs, the PIC should develop a "speakers bureau"; a resource list of Amateurs willing to present programs about Amateur Radio to non-amateur groups and agencies.

He will maintain contact with other Section-level League officials, particularly the Section Emergency Coordinator, State Government

Liaison, Affiliated Club Coordinator, and Bulletin Manager on matters appropriate for their attention, to insure a unified ARRL Field Organization.

The duties and qualifications for the Public Information Officer appointment are specified in document FSD-103, "Guidelines For The ARRL Public Information Coordinator". The PIC should also be familiar with document FSD-104, "Guidelines for ARRL Public Information Officers".

Forsale $250.00 40 for tower

I have a 40 foot tubular steel tower for sale. It is professionally refinished and looks brand new. Tower was sand blasted clean, primed with industrial zinc chromate, and top coated with tower gray enamel.

Tower has tilt over base mount and requires a 2 by 2 by 4 foot concrete base. The tower is 12 inches on aside, and would require bracketing to a house or guying to insure stability (like any typical tower). It is similar in dimension to a RHON 20 or 25 model.

The tower is in great shape and requires no clean-up. Don't miss this bargin!!

Call during the day or leave message for Greg at 201-896-7475.

3954. Technical Specialists needed

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 18:52:30 UTC
From: lhurder@arrl.org
Message-ID: <205@arrl.org>
Source record: 288079

The ARRL Field Organization is in need of Technical Specialists in EVERY state and section of the country. If you have specific knowledge about ANY of the technical aspects of the Amateur Radio Service that you'd like to be able to share with others when the need arises, I invite you to examine the following job description for the ARRL Technical Specialist.

An application for the TS appointment can be obtained by E-mailing me. Please be specific as to what you need, and be certain to provide me with your U.S. Mail mailing address.

Technical Specialist

For a section team to be effective in one of the most important arenas in Amateur Radio, technology, there must be a cadre of qualified, competent Technical Specialists. "Advancement of the radio art" is a profound obligation we incur under the rules of the FCC. TSs help meet this obligation.

Appointment by the SM, or TC under delegated authority from the SM, the TS supports the TC in two main areas of responsibility: Radio Frequency Interference, and Technical Information. TSs can specialize in certain specific technical areas, or can be generalists. Here is a list of specific job duties:

1. Serve as a technical advisor to local hams and clubs. Correspond by telephone and letter on tech topics. Refer correspondents to other sources if specific topic is outside TS's knowledge.

2. Serve as advisor in radio frequency interference issues. RFI can drive a wedge in neighbor and city relations. It will be the TS with a cool head who will resolve problems. Local hams will come to you for guidance in dealing with interference problems.

3. Speak at local clubs on popular tech topics. Let local clubs know you're available and willing.

4. Represent ARRL at technical symposiums in industry; serve on CATV advisory committees; advise municipal governments on technical matters.

5. Work with other ARRL officials and appointees when called upon for technical advice, especially in emergency communications situations where technical prowess can mean the difference in getting

a communications system up and running, the difference between life
and death.

6. Handle other miscellaneous technically-related tasks assigned
by the Technical Coordinator.

Technical Specialists must hold Novice or higher class license;
ARRL membership required.

I have a TS440/AT and a TS-950. I use my TS-440 for mobile work and the TS-950 at home.

I looked at the TS450/AT thinking the same a you. You can get about $950 for your TS440/AT. A new TS-450 is about $1229. Thats $279 you will pay for an upgrade.

If you look at the TS-450 its functionality is not much more than the TS440. Sure, it has a fancy digital display and a few more bells and whisteles. But, it is pretty much functionally identical.

For mobile operation it does have one outstanding feature over the TS440 -- a real power control. Even with a DieHard Gold at 900 amps by battery is not a happy camper running peak 18amps.... esp bad for 10m FM operation.

$279 difference. Is it worth it. Its up to you. I say "nope"!

Gary

Why would anybody load up 30mb worth of OS just to run amateur radio?
Easy! I don't just want to run amateur radio! I want to use it for other
things at the same time - and OS/2 is *superb* at that.

I'm running the WG7J variant of the KA9Q NOS tcpip program for amateur
radio in a dos session. I'm using an Ottawa PI hdlc interface card (instead
of a TNC) to drive a 56Kbps radio channel. For more info on OS/2 2.0
and NOS, telnet jks@giskard.uthscsa.edu, and read the FAQ messages
in the area OS2_FAQ.

Cheers (and 73),
Dave

I strongly disagree. OS/2 would make a fine operating system for
amateur radio applications. True multitasking should prove extremely
valuable to amateur radio operators.

The entire extent of my knowledge with respect to amateur radio
applications is that KA9Q/NOS is available in an OS/2 version (with
partial PM support). It presently operates only with SLIP, but that's
fine for amateur radio. It looks like an interesting package. You
can obtain it via anonymous ftp from ftp-os2.nmsu.edu, directory
pub/downloads/tcpip (though that is subject to change).

Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

RAPID MAJOR SOLAR FLARE ALERT

ISSUED: 20:35 UT, 25 JUNE

/\

X-CLASS EVENT
POTENTIAL PROTON FLARE

ATTENTION:

A major solar flare is in progress. X-rays peaked at a class X3.9 level at 20:14 UT. Early preliminary data suggests a potentially significant long decay signature with a high integrated x-ray flux. This is a potential proton flare and may be successfully accellerating high energy protons.

There is a risk for proton activity at greater than 10 MeV over the next six hours. An enhancement of higher energy protons at greater than 100 MeV is also not out of the question.

A significant sudden ionospheric disturbance is in progress. High x-ray flux is producing intense D-region absorption. Radio blackout conditions on all frequencies are being observed at the present time.

Users of polar and high latitude radio signal paths should be aware of the increased threat for potential polar cap absorption activity, possibly commencing over the next six to twelve hours if protons arrive.

A more detailed analysis of this event will be released in several hours.

** END OF RAPID ALERT **

3964. ALERT: SATELLITE PROTON AND PCA EVENT ALERTS

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-25 21:45:30 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.709508730@honte>
Source record: 288174
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

SATELLITE PROTON & PCA EVENT ALERT

ISSUED: 21:40 UT, 25 JUNE

/\

PROTON EVENT AT > 10 MEV ALERT
POLAR CAP ABSORPTION EVENT ALERT

ATTENTION:

Protons at greater than 10 and 100 MeV have shown a strong positive signature. Protons at greater than 10 MeV rapidly passed the event threshold of 10 pfu at 20:45 UT and increased rapidly to a preliminary maximum near 21:10 UT. Protons at greater than 100 MeV are well below event levels but are enhanced well above background levels.

This activity was not associated with a ground level event.

Levels of polar cap absorption (PCA) surpassed the event threshold of 2.0 dB at 20:35 UT. Moderately strong polar ionospheric absorption is strongly degrading HF signals passing through the polar regions. Users of the OMEGA navigation signals may experience errors on polar paths due to the enhanced absorption. Preliminary analysis suggests the PCA activity likely will not become particularly significant. However, levels of PCA will be high enough to affect (possibly quite substantially) signals propagated through the polar and/or high latitude zones.

Preliminary analysis of the proton characteristics suggests this likely will not not be a particularly strong proton event. Protons are expected to stabilize or increase again within the next several hours, followed by a gradual decay over the next 24 to 48 hours. Consult the major flare alert (to be released within the next several hours) and the daily activity summary for more information.

** End of Alert **

>about all there is to it. Unfortunately, though, I think that all they
>can tell you is whether it's been issued (and, if so, the call sign).
>If it's still waiting to be processed, I don't think they can determine
>where in the pile it is.

The problem is.... By the time this information is available to them, under normal circumstances your ticket will already have arrived. So, this service is only useful to resolve licenses which have encountered some dificulty after assignment. Like being lost in the mailroom, or by the mail carrier, or misprinted somehow, etc...

To reiterate: Under normal circumstances, YOU will know before they do.

Also, wait AT LEAST 8 weeks before you call, no need burdening an already ridiculously overburdened department when it won't even do you any good.

73! And congratulations to your daughter on her new ticket, now you need to get her on the net! :) :)

3967. Phased Vertical Idea (cq elmer)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 00:19:00 UTC
From: awpaeth@watpix.waterloo.edu
Message-ID: <BqFFJp.1J6@watcgl.waterloo.edu>
Source record: 288086

The recent discussion of verticals reminded me of an idea I had last month.
I'd like to brainstorm with the net a bit (read: please suspend disbelief while
"under construction"), but the FAQs articles with elmer's names have expired.
Maybe some RF types can shed light, or just emit photons of lower wavelength.

/Alan Paeth VE3AWP/KD3XG

Wanted: vertical antenna with some gain/directivity on HF, low parts count.
Scenario: suburban house, no moving structures wanted on roof, avoid a tower.
Idea:

```
Reversable End-Fire Array - VE3AWP/KD3XG
|<- 3/4 L ->|
_____ _____ Basic idea: the 3/4 L antenna interconnect
\ | / \ | / can be driven from either end using a SPDT
\|/ \|/ coax relay. Sizing the symmetric feedlines
| rooftop | to 1/2 L (e.g.) leaves the floating end an
| | open circuit "unmatched" stub. Given a 50'
.-------------. suburban roof, 3/4 L at 20m is a nice fit.
\ / A .75x scale 15m band version can also work
\ / 40m as a 3rd harmonic. Use two SPST relays
1/2 L \ / 1/2 L for in-phase double-end drive: a broadside
\ / pattern with 5dB gain then fills the gaps.
\[ ]/ SPDT relay
|
feed
```

You heard it here first, now for the questions:

Will it work?!
Are the stub length correct?
Does feed point impedance vary for broadside vs endfire?
Are matching components or other reactance necessary? (hope not, but if so..)
Do 5/8 L verticals (with 3/4 L electrical lengths +jX) work well in end-fire?
Does the 3/4 L spaced end-fire pattern differ much versus 1/4 L (more nulls?)

Bottom line: where *does* all the RF go, both inside and outside the coax?
(Long ago I was taught NOT to split an RF tranmission line like a power grid).

I'm hoping this is a feasable design. The standard alternative is to put up
two verticals with 50' spacing and drive one in phase, the other through a 90o
phasing line. A single relay is once again used, here to give +-90o phase by
reversing polarity. But I don't like the feed line asymmetry. Also, I don't
want to lose the broadside option -- it appeals to me. This design seems both
minimal and has no redundant or useless states: some coax and two SPST relays
yields the states/patterns {Off, E, W, N-S}.

Before building at all I need to explore the design space of phased verticals. Almost all the directional designs in print use 1/4L vertical elements and 1/4L horizontal spacings. Why is this so sacred? (True, odd multiples of 1/4 phase drive make no difference, but in spacing and antenna height they clearly alter patterns and take-off angle). Does end-fire gain go drop fast at 3/4 L spacing?

The texts all emphasize good grounds. I'd think a 5/8 L vertical would be even better in this respect -- its 1/4 L radials just counterpoise a 1/4 "portion" of the radiator (I conceptualize it as a symmetric 1/2 L vertical with another 1/4 L section to deal with, all electrically reduced to 5/8 L for low angle).

Posting a/o e-mail welcome.

Happy brainstorming...

/AWPaeth

3968. ZA1QA, HA5BUS

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 01:12:00 UTC
From: oo7@ut-emx.uucp
Message-ID: <74685@ut-emx.uucp>
Source record: 288083

Yes, I know that anyone who is anybody has dozens of ZA QSL cards now, but I never received mine from ZA1QA - has anyone had any from them? As I recall, QA stands for Quick Aid, and they were the group that was going to activate ZA before everyone else. Perhaps the Quick Aid is not to hams?

Also, has the Globex Foundation sponsored any expeditions before the HA5BUS one? I'd love to think that they will soon be sending out the cards for EP and S2...

/\

MAJOR SOLAR FLARE ALERT

ISSUED: 01:45 UT, 26 JUNE

/\

MODERATE TO HIGH IMPACT EXPECTED
PROTON AND PCA EVENTS IN PROGRESS

MAJOR ENERGETIC EVENT SUMMARY:

(All times are valid for the UT day of 25 June)

Flare Size: Class X3.9/2B (impresssive LDE signature)
Location: N09W67 (Region 7205)
Tenflare: 2,500 sfu at 25/1953 UT. Duration: 95 minutes
SESC Times: Begin=25/1951 UT, Peak=25/2014 UT, End=25/2057 UT
(SESC Times are based on a half-power-point system)
SESC Integrated X-Ray Flux: 0.91 Joules / m^2
Sweeps: Moderate Type IV Sweep (Importance 2) at 25/1957 UT, Dur = 68 min
No Type II Reported (likely obscured by the Type IV).

PRELIMINARY X-RAY TIME PROFILE DATA AND ESTIMATED STATISTICS:

BEGIN (XRAY)	MAX (XRAY)	END (XRAY)	DURATION	INTEG. FLUX	SWF DUR.
1951 (C3.6)	2014 (X3.9)	0030 (C9.9)	279 MIN.	1.323 J/m^2	273 min

NOTE: The xray time profile data above is not based on the half-power-point system, but is intended to give a general idea of the duration of the entire event, from the start to the end when xrays fall below M-class levels. Integrated x-ray flux covers the interval from start to end.

SYNOPSIS:

X-rays from this major flare remained above X-class levels for an impressive 66 minutes. Prior to the event, fairly strong magnetic gradients and shear existed in the region as it continued to slowly grow. Signs of destabilization and increasing energetic activity from this region were observed earlier in the UT day. The flare produced a fairly rich spectrum of radio activity with typical measured intensities in the thousands of sfu.

An extensive and significant ionospheric short wave fadeout (SWF) was observed in conjunction with this activity. D-region absorption was

significant enough to black out HF signals on most paths and frequencies from the equatorial to middle latitude regions over the daylit paths.

Protons arrived at near relativistic speeds only approximately 30 minutes after the start of the flare event, near 20:20 UT. Protons at greater than 10 MeV surpassed the event threshold of 10 pfu at 20:45 UT and have now exceeded the 100 pfu level. Protons at greater than 100 MeV are slowly decaying. There is the potential for protons to significantly exceed present levels by the time the anticipated flare shock arrives. The proton event is expected to continue through 27 June (inclusive).

A PCA event began at 21:35 UT and is gradually increasing in intensity. There is a chance PCA levels could become fairly signficantly enhanced over the next 24 hours. PCA activity has significantly degraded polar path radio signal propagation and is expected to continue in progress throughout the next 48 hours. It will begin to weaken following the flare shock anticipated on 27 June.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

The following tables depict the preliminary estimated potential for terrestrial impacts in various categories.

DEFINITIONS:

Date (day only)
Possible Magnitude of Solar Flaring (LOW=C-class, MOD=M-class, HIGH=M or X)
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)

GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

```

CONFIDENCE LEVEL: 60%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

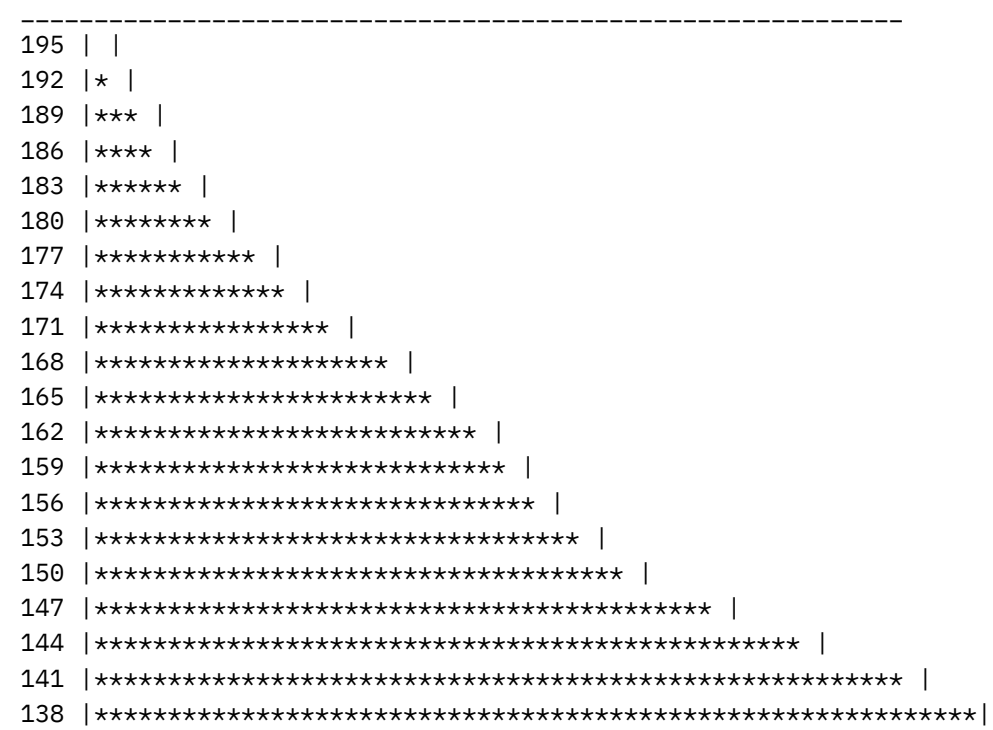
GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

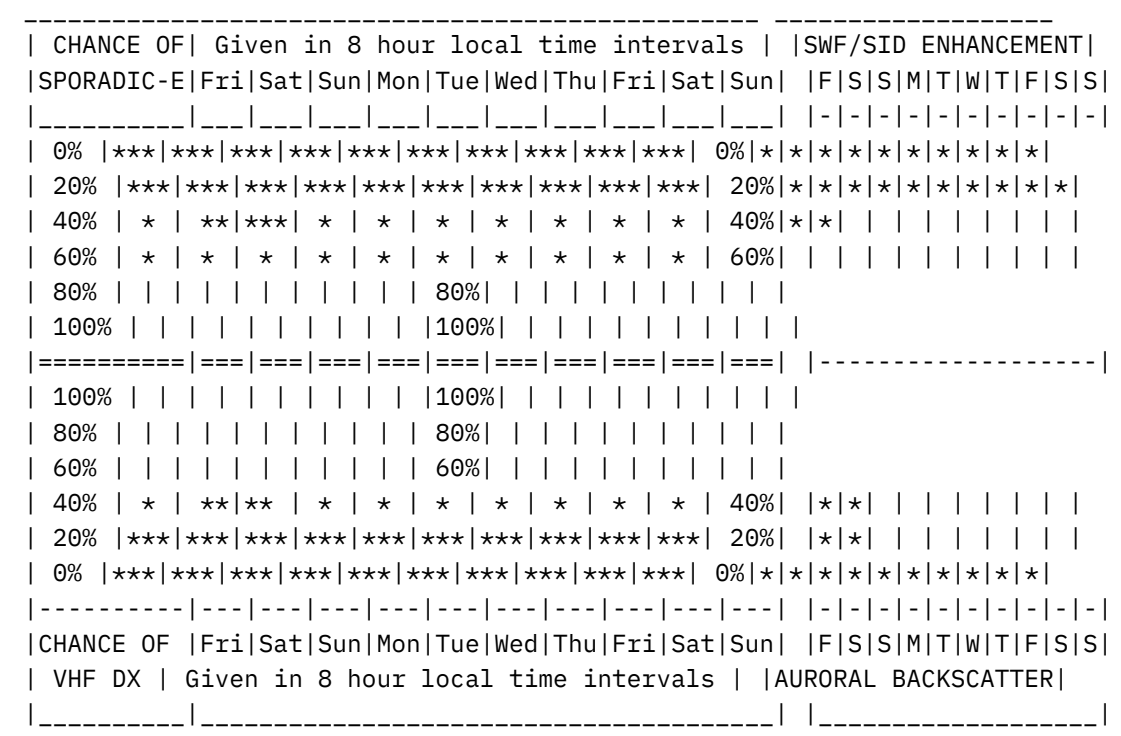
LOW LATITUDES



NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

AURORAL ACTIVITY PREDICTIONS (26 JUN - 05 JUL)

3972. AURORA WARNING: Middle Latitude Auroral Activity WARNING

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 04:12:25 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.709531945@honte>
Source record: 288087
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 04:00 UT, 26 JUNE

/\

HIGH RISK PERIOD: 27 - 28 June (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE - HIGH

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >47 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: GOOD - VERY GOOD

AURORAL ACTIVITY _MAY_ BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

SOUTHERN OREGON/NORTHERN CALIFORNIA TO NORTHERN NEVADA AND SOUTHERN
IDAHO TO NORTHERN UTAH TO PARTS OF WYOMING AND COLORADO (PARTICULARLY
EASTERN PORTIONS OF THESE STATES) TO SOUTHERN NEBRASKA AND POSSIBLY
NORTHERN KANSAS TO CENTRAL MISSOURI TO SOUTHERN ILLINOIS TO SOUTHERN
INDIANA AND POSSIBLY PARTS OF KENTUCKY TO WEST VIRGINIA TO SOUTHERN
DELAWARE.

SYNOPSIS...

A very impressive class X3.9/2B Proton Flare erupted at 20:14 UT on 25
June out of a region approaching the west limb (Region 7205). This flare had
exceptional characteristics associated with strong interplanetary coronal
mass ejections. This event has launched a disturbance which should be in
transit to the Earth. Although the plasma cloud likely won't produce
activity as strong as if the flare had occurred near the central solar
meridian, there is a moderate to high probability we will see storm activity
from this event.

The disturbance is expected to arrive near 18:00 UT on 27 June. If it
arrives on time, North American and Australian/New Zealand regions will be
well placed for observing the energetic phase of auroral activity. Activity
is expected to be moderate to strong over the high and middle latitude
regions during the local evening and early morning hours of 27/28 June.
There is some doubt that activity will remain energetic enough to be observed
during the local evening and early morning hours of 28/29 June.

Lunar phase will not inhibit observations of auroral activity. This may
be a prime opportunity to view and/or photograph auroral activity, if the

disturbance arrives. Lunar phase is estimated to be at only approximately 15 percent illumination during the interval of 27 to 28 June and is not expected to rise until well after midnight. For best results and observations of weak diffuse or intricate activity, seek a dark sky site away from city or town lights.

Region 7205 is not expected to produce another energetic event capable of producing geophysical activity before it rotates out of view on 27 June. This region will not return to the east limb of the sun until near 10 July. There is only a slight chance the region will return in a volatile configuration.

** End of Warning **

LOW LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 04:00 UT, 26 JUNE

/\

MODERATE RISK PERIOD: 27 - 28 June (UT days)

POTENTIAL MAGNITUDE OF LOW LATITUDE AURORAL ACTIVITY: LOW - MODERATE

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >47 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM LOW LATITUDES: FAIR - GOOD

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

SOUTHERN OREGON/NORTHERN CALIFORNIA TO NORTHERN NEVADA AND SOUTHERN
IDAHO TO NORTHERN UTAH TO PARTS OF WYOMING AND COLORADO (PARTICULARLY
EASTERN PORTIONS OF THESE STATES) TO SOUTHERN NEBRASKA AND POSSIBLY
NORTHERN KANSAS TO CENTRAL MISSOURI TO SOUTHERN ILLINOIS TO SOUTHERN
INDIANA AND POSSIBLY PARTS OF KENTUCKY TO WEST VIRGINIA TO SOUTHERN
DELAWARE.

SYNOPSIS...

A very impressive class X3.9/2B Proton Flare erupted at 20:14 UT on 25
June out of a region approaching the west limb (Region 7205). This flare had
exceptional characteristics associated with strong interplanetary coronal
mass ejections. This event has launched a disturbance which should be in
transit to the Earth. Although the plasma cloud likely won't produce
activity as strong as if the flare had occurred near the central solar
meridian, there is a moderate to high probability we will see storm activity
from this event.

The disturbance is expected to arrive near 18:00 UT on 27 June. If it
arrives on time, North American and Australian/New Zealand regions will be
well placed for observing the energetic phase of auroral activity. Activity
may not be quite energetic enough to be observed over widespread low latitude
regions. However, this is a potentially significant period for observing
auroral activity. Low latitudes are therefore alerted to the possibility of
observing visible levels of auroral activity under dark skies.

Lunar phase will not inhibit observations of auroral activity. This may
be a prime opportunity to view and/or photograph auroral activity, if the

disturbance arrives. Lunar phase is estimated to be at only approximately 15 percent illumination during the interval of 27 to 28 June and is not expected to rise until well after midnight. For best results and observations of weak diffuse or intricate activity, seek a dark sky site away from city or town lights.

Region 7205 is not expected to produce another energetic event capable of producing geophysical activity before it rotates out of view on 27 June. This region will not return to the east limb of the sun until near 10 July. There is only a slight chance the region will return in a volatile configuration.

** End of Watch **

Hmmmm. *I* made that video, maybe I ought to go back and look at it again. :-) I do recall that the energy from the modem is 26 db down at +/- 35 kHz.

[deleted]
>Conclusion:
>If you have alot of discipline or automatic power control, then 100 kHz will
>probably work without any problem. If not, then you probably won't get the
>performance you are expecting.

Nearly all of our activity is with dedicated links that are engineered to have good SNR. Our LAN (MAN, WAN, whatever) hasn't gotten off the ground yet. We're planning to do that crossband as Doug has probably already told you. Transverter performance is really horrible without lots of extra filtering.

>I believe the reason there is a problem closer than 150 kHz is that the IF
>filter is somewhat wider than 100 kHz and tends to let through alot of
>energy from the adjacent channel.

That depends on how you tune it. You can tune the filter so narrow that the eye closes down. When you tune for the cleanest eye, you aren't at the filter's narrowest setting. It's a tradeoff between bandwidth and group delay. Depending on your link SNR, you can make tradeoffs here.

What kind of on channel cavities are you using? We're using two pass cavities in cascade at our sites. I should hasten to add that we aren't using adjacent channels at our sites so your experience in this area is greater than ours. The cavities are to keep the multi-hundred watt pagers on the same sites from creaming the transverters. The IF filter is a lot less critical in our application than intermod in the transverters.

>antennas, how should they be mounted? Is it ok to have them
>stacked one above the other on the mast? What if any are the
>spacing considerations? You mention an H frame, I assume the
>H is parallel to the ground?

You can stack vertically, and you can stack side by side, and you can do both as with the H frame. The ideal spacing for maximum gain is frequency dependent. With the TV log periodics it's impossible to use an ideal spacing because the frequency spread is too wide. I use a compromise stacking distance of 8 feet.

Let me describe the construction of the H frame and maybe it will be clearer. The H stands upright with the rotor connecting to the middle of the crossbar and the antennas connect to the points of the letter. I used 1" ID black gas pipe since I had a lot of it on hand. The center of the crossbar is a pipe Tee with 4' lengths of pipe screwed then welded into it to form the bar, and a coupler and 1.5" line pipe screwed and welded to it extending downward to the rotor. Each upright of the H consists of two 4' pieces of 1" black pipe screwed and welded into Tees on the ends of the crossbar. The antennas have a boom brace so the top ones are mounted normally and the bottom ones are mounted upside down so that the braces nearly meet at the center of each upright.

Lighter gauge H boom materials could have been used, this is a heavy sucker, but I used what was on hand, and also we have lots of high winds so I wanted strength. The homemade tower is constructed of three sections of 2" drill tubing so it can handle the load easily. Note that each junction is welded in addition to being screwed together to prevent it working loose in the wind. I was working for an oil field service company at the time so materials weren't a problem. Nor was access to a boom truck to hoist the assembly.

>How do you bring down the multiple signals from the antennas?
>Do they each have a cable or do you "mix" them on the mast?

Fortunately, four 300 ohm feeds in parallel works out to 75 ohms. Each antenna has an equal length of 300 ohm twinlead coming to a connecting block at the center of the H. They are all paralleled there, with the bottom two antennas' leads having a half twist to account for their upside down mounting arrangement. 75 ohm coax is attached to the parallel connection and carries the signal down to the set.

Message-ID: <01GLNZ1M42GG94DXI8@ROSEVC.Rose-Hulman.Edu>
Source record: 288097

The the guy who is wondering about the advantages of the TS-450 over the TS-440:

Sell the 440 and get a 450.

I have used both for an extensive length of time, so I feel I can judge. HI.

The TS-450:

1. Has more features.
2. Is more "user friendly".
3. Isn't obsolete.
4. Will only cost you a few bucks since used 440s sell quickly.
5. Has the POWER control for QRO or driving another device.
6. Has bargraph meters which are much more "real time".
7. Has much better and more flexible scanning.
8. Has the best audio notch filter I've ever seen.
9. Will accept many filters.

The only thing I don't like about 450/690 is that there is no random access capability of memory. (Any one know how to do this?)

I think my Cushcraft R5 has developed a problem. It doesn't seem to be
a good match to 50-Ohm coax anywhere in the 17- or 20-meter band. It's
still okay on 15, 12, and 10 meters.

It used to be a good match on 17 and 20. I presently sleuthing this
problam. I post this cuz maybe others have had the same
experience. (Lightning?)

My only HF antenna is a 80m fullwave horizontal loop that is about 20'
off the ground. I feed it with 50 ohm belden 9913 equivalent
coax with an air choke balun at the feedpoint. I use it on all
the nine HF bands with the antenna tuner built into my Kenwood rig.
The swr is within 3:1 on all but the 30m and the 160m band. In any
case, the tuner seems to handle it. The radiation pattern is more
or less omnidirectional.

I do not have other hf antennas and so I have not done a side by side test.
However, during local nets on 10 and 15m, my station hears what most
others cannot. Others in the local net use dipoles, Yagi's and verticals.

I work a fair bit of qrp with 1w output on 40m. I have had contacts on both
coasts with this set up.

The one problem that I have with my set up is its hieght. It is too low
for 40m and below in frequency. I analyzed my set up using Mininec3.
For 80m the radiation pattern is like an apple. Terrible for Dx but
good to get the close in states for WAS! Raising the antenna is a non-trivial
task as it requires 4 supports: one at each corner. Three would do in a
pinch.

Operationally, I think that the antenna is not any better or worse
than a double extended zepp cut for 80m. However, the Zepp would
only require two supports. If I were to do it again, I might try
that with higher supports.

3993. 800Mhz Trunking..

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 16:15:41 UTC
From: jga@dreaml.wariat.org
Message-ID: <uweZmB4w164w@dreaml.wariat.org>
Source record: 288109

Does anyone on this newsgroup have an idea of frequencies to search to find
Motorola 800MHz trunking systems?

Thanks in advance.. I know a Motorola technician answered one of my
previous questions, so I'm hoping he's still around.

3994. Plastic decoy owl: range?

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 17:19:46 UTC
From: rob@xyzoom.info.com
Message-ID: <1992Jun26.171946.563@xyzoom.info.com>
Source record: 288114

I just put up a tower and antennas at my new home. Birds are starting to use the A4 HF beam, and the VHF antennas, as roosts; their droppings are becoming a nuisance. Another ham suggested a plastic owl mounted somewhere on the tower to keep the birds off the antennas.

1) I enjoy birds and am a bit of a birdwatcher, so I am worried that if I mount the owl, I will frighten too many birds off my property. What is the effective "range" of the owl? The one I have is about 16" tall.

2) If I go ahead and mount the owl, the easiest way to do it is to bind it to the mast above the HF beam. Most of the owls I've seen are mounted on separate little booms as if they are perched on a "limb" of the tower. Will mounting mine very close to the mast decrease its effectiveness (perhaps achieving the reduction in "scare effect" --allowing a "normal" amount of avian activity)?

Regards--

3995. TS-940 Computer Interface info wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 18:04:01 UTC
From: paul+@andrew.cmu.edu
Message-ID: <ceGpil_00iUz44CkUX@andrew.cmu.edu>
Source record: 288113

I would like to build a computer interface for my TS-940.
I know that the Kenwood supplied interface is a small circuit board
that goes into Digital Unit A, where the 8080 is located.
If anyone actually has the Kenwood interface board, I have some
questions for you:

1. What chips are on the board (8251 ???)?
2. There must be a clock source on the board, is it a xtal oscillator?
3. What is the default baud rate of the interface (4800 baud ???).
4. If you have a schematic of the interface, could I get a copy?

I already have built up a "level translator" from a 1488 and 1489
line receiver and transmitter. I need more info about the actual
interface itself. I thought I had it figured out, but I can't get
the one I built to communicate with my AT clone.
Any help would be greatly appreciated.

Source record: 288116

That's true, but what if you only needed one tuner? As the frequency range goes up, the passband of the front-end covers a greater frequency range with the same Q. The result would seem to be more frequency coverage with one front-end.

>Broadcasters use VHF for the same reason that 2 meters has better
>area coverage than 70 cm. The longer waves refract around obstacles
>better. Most of a broadcaster's grade A coverage is not line of sight.

I don't disagree, but North Carolina to Tulsa, for example, expands the mutual coverage area a bit more than most viewers would like.

Lightning damage will most likely not affect the traps, unless it fries them all. I have a R3 that was subjected to a close strike <1/4 mi. The tuner moter, all the transorbs in the house, the heater electronics were all fried. The heater actually caught fire. However, the traps worked fine and are still in use today. I have heard that water in the traps is the most likely culpret. Mine have seemed to stay reasonably dry, but I do notice a SWR shift on wet days (not in CA, but back when I was stationed in MD).

I think I've finally found a rationaliz...um...good reason to get into amateur radio.

Our two daughters will be leaving home to go to school about 250 miles away the year after next. And mom *really* wants to be able to talk to them on a reasonably regular basis (and the girls are sympathetic to the notion). The phone company begin to take avid interest...

1. What bands can no-code ticket holder use?
(mostly a geeky-type question for me.)

2. What would be a reasonable transceiver pair for use to get to permit such communication? (We're talking about a family that's paying for 2 college tuitions on an income appropriate to mere mortals.)

They don't have to be matched pair, btw.

3. What sort of antenna(e) would be optimum for this application?
(Night/evening conditions, @250 miles, sierras <--> Pacific coast.)

4. What's a good source for study materials for the no-code license?
(We can add the code later.)

4001. Revised Auroral Activity Forecast (06/26)

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 21:54:57 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.709595697@honte>
Source record: 288121
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

REVISED MIDDLE AND LOW LATITUDE AURORAL ACTIVITY WARNING

UPDATED: 21:30 UT, 26 JUNE

/\

-- REVISED --

HIGH RISK PERIOD: 27 - 28 June (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE - HIGH

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >47 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: GOOD - VERY GOOD

AURORAL ACTIVITY _MAY_ BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

SOUTHERN OREGON/NORTHERN CALIFORNIA TO NORTHERN NEVADA AND SOUTHERN
IDAHO TO NORTHERN UTAH TO PARTS OF WYOMING AND COLORADO (PARTICULARLY
EASTERN PORTIONS OF THESE STATES) TO SOUTHERN NEBRASKA AND POSSIBLY
NORTHERN KANSAS TO CENTRAL MISSOURI TO SOUTHERN ILLINOIS TO SOUTHERN
INDIANA AND POSSIBLY PARTS OF KENTUCKY TO WEST VIRGINIA TO SOUTHERN
DELAWARE.

SYNOPSIS...

The anticipated arrival time of the interplanetary shock from yesterdays
flare has been revised. We've decided to weight the forecast a little
heavier towards a fairly fast shock velocity in order to better agree with
new data received over the last 24 hours.

As a result, levels of auroral activity could become quite strong during
the local evening and early morning hours of 26/27 June (during the UT days
of 27 and 28 June). Most of the activity will occur during 27 June. The UT
day of 28 June should be primarily a day of recovery and stabilization.

Shock arrival times could vary from as early as approximately 02:00 UT
on 27 June to as late as 18:00 UT on 27 June, with a preferred arrival time
of between 04:00 UT and 10:00 UT.

Conditions are still expected to be good for viewing levels of auroral
activity. Moderate to occasionally high levels of activity are still
expected to accompany this disturbance over the middle to polar latitude

regions.

4002. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 22:20:05 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Jun26.222005.15631@afit.af.mil>
Source record: 288010

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

4003. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-26 22:21:20 UTC
From: tkelso@afit.af.mil
Message-ID: <1992Jun26.222120.15817@afit.af.mil>
Source record: 288011

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)

Line 2
Column Description

01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293

>the other centers normally get the Shuttle video from... I liked
>being able to watch it from the *source* at times, especially when
>NASA Select was doing replays, press conferences, "Today In Space"
>or whatever...

I was astonished to note the same thing last night. For
what it is worth it seems to be the same LEITCH scrambling system
as used by ABC for their feeds but with different key sequences.
This system works by shuffling horizontal scanning lines in the
upper half the picture under control of a key sequence and then
transmitting them in the lower half, and doing the same with scanning
lines in the lower half and transmitting them in the upper half.
Chroma phase is also randomly inverted for the lower half lines.

The only reason I can think of for routinely scrambling
the backhual on this shuttle mission is that the investigators may
be concerned that significant components of their raw data is being made
available to the world at large before they get to filter and review
it. It is also possible that confidential medical stuff may occasionally
be transmitted (but they could just turn the scrambling on for that
when they need it - ABC turns it on and off all the time).

I miss the raw feed - for the science on Select they tend to
show endless shots of groups of people standing around looking at
workstations rather than showing the experiment video and I found the
experiment video often was much more interesting. And I could see
significant quality differences (especially last fall) between the
direct stuff and the Select video. I might also say that is is
annoying to see the experimenters talking heatedly on various audio
loops and not be able to hear what they are saying..

Any Cornellians out here?
I remember reading articles from members of the Cornell ARC.
Hope one of u will c this.
I have a Novice friend at Cornell who's exhausted his effort
to locate the Cornell ARC. He would be overjoyed if someone would him
info leading to the Cornell University ARC.
His name: Dennis Cho. Email address: YVYX@CORNELLA.cit.cornell.edu.
Tnx,

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

While we`re at it, why don't we at least try to level the playing field for the folks in the less-populated and remote Sections/Divisions by making the number of Sections/countries worked a multiplier?

For you purists who would argue that FD *isn't* a contest: Fine, but then let's also change the exchange to something that at least resembles information that would be passed during a Real Emergency (tm). At least as complicated as the SS exchange...let's face it, the current exchange is a no-brainer, and as many net-folk pointed out last year, you don't even have to keep a log, if you choose to live life on the edge ;-)

You did remember to try to listen for the KH*'s and KL7's this year, didn't you?

4009. Digital Radio or satellite Olympics??

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-29 13:43:40 UTC
From: abh@genesis.nred.ma.us
Message-ID: <920629239O1@genesis.nred.ma.us>
Source record: 287937
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

I am interested in hearing from anyone who either has information
on digitally transmitted commercial radio broadcasts or
Olympics broadcasts by satellite. I understand that
Japan and Europe have digital radio broadcasts by satellite
and I am curious about any transmissions receiveable
in the US.

Cablevision has a cable coverage of the Olympics via a pay-per-view
but I am not on cable and won't be by late July.

Any pointers appreciated. Thanks

Andrew

No, this is not a joke. Some OF's at the club meeting a couple years ago stopped talking about their gall bladder and bypass operations to talk about this. I was really terrible...hit on a field day weekend. All gear in the vicinity was destroyed. Very terrible accident.

4011. Broadcast manufacturers

In article <1992Jun27.215726.2987@murdoch.acc.Virginia.EDU> rfa@Turing.ORG (Robert F. Alexander) writes:
>
>Excuse me but didn't Collins and Rockwell turn into
>Continental out of Ft.Worth Texas. I have two Rockwell 828e
>AM transmitters and I buy all my parts from Cont. Sure seems
>strange to me; :):):

Collins was absorbed by Rockwell and Rockwell sold off part of the broadcast line to Continental. This has happened several times with most of the broadcast manufacturers, it's a very small market. Harris bought Gates, then got out of the broadcast business, then Harris bought out GE broadcast and got back in, GE folded RCA when they bought them out and the equipment is now supported by a group of ex-employees. Ampex has drifted in and out of the transmitter business as have several other companies. It's sometimes hard to know who made what and who still supports it without a serial number.

On at least two ocasions that I'm aware of, consortiums of broadcasters have bought out a failing manufacturer so that they would have a continuing source of support. IVC is the most obvious example. The broadcast market is so small that much of it is supplied by garage shops that don't outlive their owners. The trend in recent years is to buy everything from Sony in the hope that their market will be large enough that they will stay in the business. That worked with RCA until GE bought them, but I doubt GE could afford Sony. GE has been the most destructive force in the business. They are said to manage by neutron bomb. When they get through with an aquisition the building is still standing but everyone is gone.

From: holly@hpcupt1.cup.hp.com
Message-ID: <73190080@hpcupt1.cup.hp.com>
Source record: 287868

For full bloody details on PRB-1, the ARRL has a very nice package.
Generally, it says the local government can not outlaw ham radio antennas
and must make reasonable accomodation for the antennas. However,
PRB-1 does not apply to CC&R's. These are considered private contracts
and outside the definition of PRB-1. Generally the Architectural Control
Committee are the people you have to ask to do anything on or around your
poperty and unless it is planting pretty flowers, they generally say no.
Interestingly, they generally are not concerned about what you do to your
structure inside, just outside. You mentioned a sattilite
dish, what about the normal T.V. antenna's? Any C.B. antenna's around?
If they have been allowing other antennas, then they have a very weak case
with you. Actually, if you put the antenna in the backyard, it will hardly
be visiable from the street. I have a Butternut HF-2V ground mounted in
my backyard and only the top 10 feet or so are visible and that is small
tubing and not very noticible. You might also want to chat with the fella
with the satilite dish and see if he just planted it or had the ACC approval.

>each other? How do I feed them to keep a 50 ohm match?
>Do I have to worry about the phasing between them? Do I
>care if the circular polarization is right handed or
>left handed?

Spacing the dipoles is the simplest course, but you can mount them together. In that case you need a phasing line between them. The usual way the antennas are combined and phased is to use two 75 ohm quarterwave sections as a combiner and add a quarterwave of 50 ohm cable between one element and the combiner. That additional delay makes up for the antenna spacing.

Left hand or right hand circular polarization is determined by which element is leading or lagging in phase. Picture the radiation vector rotating and choose which linear polarization you want to match the vector first. It certainly does make a difference if both ends are circular polarity. There's a 30 db cross polarization loss if they don't match. For receiving a linearly polarized signal, there is a constant 3 db loss regardless of the circularity sense of the antenna.

Circular polarization can help in cases of spin modulation, but if your application is terrestrial, most of your problems will be with multipath. CP can help there, but only if both ends of the circuit are running the same polarization. Because the polarization sense reverses when the signal is reflected, you can achieve nearly 30 db of rejection of the reflected signal. However, if you are intending to use a linearly phased antenna at one end of the path, diversity reception will be much better than CP in reducing multipath problems.

Message-ID: <73190081@hpcupt1.cup.hp.com>
Source record: 287869

sean@ms.uky.edu (Sean Casey) want to know if PEM is legal in amatuer
radio...

>PEM stands for Privacy Enhanced Mail. In PEM, the "normal" thing to do
>for email messages is encrypt the content so that it can be transmitted
> over insecure networks... like the Internet. It also
> [etc..]
>The current standard being worked out uses a combination of RSA and
>DES encryption to authenticate the sender's identity and seal the
>message in an "envelope". The message headers are in cleartext.

currently, in a word, no. Part 97.113(d) states:
No station shall transmit: music, ..., messages in codes or ciphers where
the intent is to obsure the meaning (except where specifically excepted
elsewhere in this Part); ...

Seems pretty clear. I was not able to find anywhere codes and ciphers were
excepted.

Wow! $22.00 for a World War II surplus Morris key!

A brand new spiffy Bencher costs about $55.00 I believe. Also I
have seen Morris keys much cheaper at swap meets.

You can get a good microphone - plug and all for about $2.00
at many swapmeets.

Seems that despite what the gasping geezers keep telling me,
chat is cheaper than Morris.

Anyone have comments they wish to share concerning their experiences
with the Radio Shack HTX-202? I got so fed up with mine I returned
it. The price was good, but the design (IMHO) wasn't.

Curious to see if anyone else's experience parallels mine.

Email or post is fine.

We had no luck either. Apparently their antenna troubles and
frequent QSYing was enough to keep them from being heard on Field Day.

Incidentally, the latest I have heard is, they are on 145.050
with a -600 kHz offset for the uplink. I'll post the message
from NASA in a few moments...

From: whiting@eucad.co.uk
Message-ID: <1992Jun30.120131.18709@Cadence.COM>
Source record: 288029

I have built a 10GHz transverter system giving about 300mW output.
I have 2 problems -

1. I could do with more power (who couldn't), but have not yet found a TWT.
I would prefer the simplicity of a GaAs amplifier if possible. Has anyone found
suitable devices at a good price? Here in the UK they seem to be big bucks.

2. I have a conical horn feed for a 4' dish. This has a circular 19mm hole as
the interface. Does anybody know how I can launch my RF into this orifice,
starting from an SMA connector? One technique is to taper gently from WG16
to the 19mm diameter, but my metalwork is not up to this!

Thanks,

Neil, G4BRK

4020. Prospective ham questions. . .

Good day, eh? I'm looking to get into ham radio and I have questions regarding what's available to no-codes. I'm aware of the bands that are available, but what is on those bands, specifically? Is there a site for FTP or that someone could email me that contains guides to 2m, 220MHz, 440MHz, etc. repeter sites, or is it just hit and miss? What about books for the same purpose? I realize that experimentation is the really fun part, but I don't wish to invest in this hobby and end up stranded by myself on a particular band.

I'm really interested in VHF/UHF and would appreciate any guides, advice, warnings, etc. that anyone can provide.

4021. Real Emergency during FD

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-30 13:24:15 UTC
From: weare@bostech.COM
Message-ID: <9206301318.AA09262@btrd.bostech.com>
Source record: 288031

Seems to me, as others have said, that there ought to be a way to shut down FD if a real emergency occurs. At any rate, it ought to be possible to do the emergency stuff, even if there's a contest like FD going on. The possibility of pranksters needs to be considered, though. The world being what is is today, some fool is going to spoof it. I suggest, for consideration by the Ham community, that the best way would be to reserve certain frequencies, on every band, for emergency use during the FD. Might also incorporate it into the FD itself, by giving points for stations maintaining an "emergency watch" on these freqs. To add some verification, ARRL (or someone) could put out hourly bulletins on those freqs, and you only get the points if you copy it correctly. Could be on different modes. The listeners could also "squeal" on violators using the reserved freqs for contest purposes, and get points for it. Maybe that's a bit too 1984-ish :-)

Will this idea work?

I had a similar problem with my Butternut vertical on my roof. I tried all kinds of stuff to fix it from the ground, but eventually had to get up on the roof. I found several cobwebs, eggcases, etc., on the coils, and cleaned them off. But it didn't help, so I had to get back on the roof. I eventually found hard light brown deposits inside the capacitors. These are the type that look like a ceramic cylinder with a metal post through the middle. This leaves a large (for insects), sheltered place between the ceramic and the post. The reason I didn't find it the first time was that there are wide aluminum straps that cover the ends of the capacitors, hiding the space where the muck was (plus some of the caps were a little higher than I liked to reach :-)). A perfect place for bugs to raise their kids...

The brown muck was real hard. I had to scrape it out with a small screwdriver. I don't know if the RF had made it so hard, and I don't know what kind of bugs caused it.

The problem has recurred a few times. Often, I'll notice a sharp change in the SWR as I tune up after a period of inactivity, and this gives me a clue. I expect this is something organic being nuked by the RF.

Date: 1992-06-30 14:52:31 UTC
From: alan@bambam.es.com
Message-ID: <1992Jun30.145231.25573@dsd.es.com>
Source record: 288035

I operated for quite a few hours during the Field Day period, and I did quite a bit of band hopping. I noticed that despite the fact that both 10 and 15 meters were open most of the time, 12 meters was deserted (we did not make a single contact on that band). The ten meter CW band was nearly deserted (we made one contact there). The ten meter phone band is 1.4 MHz wide, so there was lots of room there for emergency nets, ragchews, you name it. There was quite a bit of non-FD activity at the high end of the 15 meter phone band (21.4-21.45 MHz). The 17 meter CW band was deserted each time that I listened there, and we only made 10 contacts on 17 meters SSB. Most of the activity that I heard on 17 was casual ragchewing. Last, but not least, the 30 meter band is still off limits according to the FD rules. It is not a big band, and SSB is not normally permitted, but, in a real emergency, most anything is permissible. Certainly several CW, RTTY or Packet networks could have been set up there. So it seems amazing to me that some people complain about the QRM from Field Day. It does not make sense that anyone would try to run an emergency network on a crowded band when they could escape to an adjacent band that is not nearly as crowded. If Field Day taught us any lessons, it taught us that there are bands available for QRM free communication even during the thick of the "competition". It seems like it would be a good idea to reserve the 30 meter band for emergency use. The ARRL could make a major point of this in the annual Field Day announcement.

Message-ID: <9206301459.AA04433@hpcstmb.neth.hp.com>
Source record: 288036

Can anyone help me with the schematic of the Realistic Scanner PRO-9200??
I have to make a modification in order to change the capture rangea a
of the squelch 'window'. This will enable frequency entries in the UHF range
which deviate from the 12.5 kHz raster.
In Holland some users on the UHF use a 20 kHz raster rather then 12.5 kHz.
The scanner locks ONLY on frequencies within +/- 3 kHz of the received freq.
so a lot of freq. are skipped when in the 20 kHz raster
(Many thanks to Bob Parnell who explained me the circuit operation)..
My problem is that I have no possibility to obtain documentation of this
scanner from Realistic here in Holland.
I hope someone can help me with it, or can give me an address in the U.S.
(or another country!!) of Realistic/Uniden.
I would be very grateful if anyone can help me!!
Many thanks in advance,

73's de Tom PA2TSL (toms@hpsctma.neth.hp.com)

I'm not aware of any way to shut things down...but I can answer for what happened after the Loma Prieta Quake up here in the San Francisco Bay region. 99.99% of the operations took place on VHF/UHF for communications in support of local government agencys. Field day doesn't have that much of an effect on VHF. Seriously, the biggest effect would be the lack of operators cuz their all stuck up on mountain tops with their radios and camping gear.

> stuff deleted..
> Heck, I learned alot about shooting up anteannas into
> trees using bow+arrow this weekend.

You might be suprised ;-) We use a custom logging program. Last year we lost about 50 Q's cuz we had a power outage and the computer went bye-bye. Well, we jury-rigged a UPS out of the parts at hand. Didn't have another single problem with the computer...now the UPS setup is part of our standard equipment and we even found a slightly simpler way to do it this year. That is the advantage of Field day from my perspsective....forcing you to work as a group to overcome obstacles...technical and otherwise. Besides, we had fun!

> Wow! $22.00 for a World War II surplus Morris key!

I agree. I find straight key prices preposterous. At the local ham store, you can pay $35 for a nothing-special Nye Viking straight key; if you add the base, you'll pay over $50. It's a nice key as those things go, but Wow! I've seen 2 meter HTs (xtal controlled, kind of beat up, but working) go for no more than that at hamfests! No wonder CW is dying.

Source record: 288040

Conway Yee writes:
> How were the combinations/symbols [in Morse code] assigned?

Morse did indeed invent the dot-dash code, and assigned the various symbols to the letter, numerals, etc. Realizing that the shortest symbols should be
assigned to the most frequently used characters, he went to a local newspaper office, and counted the number of each character they had in their type bins (type was, of course, hand set in those days). Thus, the letter "E", being the most commonly used in English, got the shortest symbol: a single dot.

>
My OM and I participated with the Mercury Western Net at 7228 which
ran most of the day and well into the evening on Sunday passing
health and welfare traffic into Yucca Valley and Big Bear.
There were three or four hams in the affected area that acted as
contact people and the net controls rotated between three hams
in Los Angeles and Orange counties. Query's concerning the
safety of family members came from as far away as Conneticut
and we were able to assure the Red Cross Director in Big Bend, OR
that her grandparents in Yucca Valley were safe and that they would
phone her in the morning. We had no problem with Field Day
activities. I have no idea how many messages were passed, but
there was to be a constant stream--especially in Yucca Valley.

>is not practical.

As a QRPer, I agree! I think the main problem with 75-meter mobile QRP SSB is the fact that the antenna system is going to be horribly inefficient. With commercial loaded-whip antennas over typical ground one would have efficiencies in the 2% to 10% range, at best. Even 100 watts PEP SSB ends up being QRP. This can be done QRP CW, but for 75-meter mobile work, higher power is usually needed. Now, on the higher bands, the antenna-system efficiency improves, perhaps to about 50% on 10 meters, so QRP SSB mobile on those frequencies becomes much more attractive.

4037. ALERT: Major Geomagnetic Storm Alert

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-30 17:40:07 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.709926007@honte>
Source record: 288044
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

MAJOR GEOMAGNETIC STORM ALERT

ISSUED: 11:30 UT, 30 JUNE

/\

ATTENTION:

Geomagnetic activity passed the major storm threshold between 06:00 and
09:00 UT on 30 June. Major to severe geomagnetic storming was observed
during the local evening hours over most regions. The source of this
prolonged activity is not clear. There are several possible sources.

Auroral activity became fairly strongly enhanced during the local
evening and early morning hours over North America and was observed from
numerous middle-latitude regions. The activity is expected to diminish
considerably throughout the remainder of the UT day, to mostly dormant
levels with occasional residual substorm activity over the higher latitudes,
by the end of the UT day.

The geomagnetic field is expected to stabilize later this UT day and
may become quiet to unsettled by the end of the UT day.

Significant degradation of HF radio signals was observed over all
regions during the last 24 hours. This disturbance, combined with the
recently observed proton-induced polar cap absorption activity, is expected
to keep ionospheric propagation below normal for as much as 72 hours before
returning to near-normal.

** End of Alert **

I think you'd all better read about Alfred Vail and his contributions
before you give Professor Morse all the credit. Although Morse "invented"
the sending and receiving apparatus, the Morse code (not the one we
use today) was suggested and implemented principally by Morse's partner,
Alfred Vail.

I wonder how many of you realize that there are two "Morse" codes in
use, even today: American Morse (as was used on U.S. wire circuits) and
International or Continental Morse (as used on radio and on wire circuits
elsewhere).

4039. Alinco DJ-580T Questions..

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-30 17:59:23 UTC
From: jga@dreaml.wariat.org
Message-ID: <oDy7mB1w164w@dreaml.wariat.org>
Source record: 288045

I have a few questions about the DJ-580T:

- What conductor of the 3 conductor mic jack is the PTT? I need this info
to build a cable for Poor Man's Packet.

- for packet, should a 2 or 3 conductor 1/8" earphone jack be used?

- I know the Kenwood TH-77A will transmit 800MHz after mods.. Is there a
mod for the DJ-580T to transmit on the 800MHz band?

adv-thanks!-ance

I'm looking for a logging program (or programs) that
runs under UNIX/XENIX to use during RTTY contests. Even
better is a logger for which the source is available allowing
me to port it to UNIX and/or customize it to my needs. I
believe WF1B has such a program for DOS and I intend to ask
him about the possibility of obtaining source for it.
Are there others? Any general purpose loggers for which
source is availble? If so, where are they archived?

Thanks,

>still use American Morse? ... or does everyone use International
>Morse? How were the combinations/symbols assigned? What were the
>considerations around the development of International Morse? Who did
>it?

The code invented by Morse was used on the land telegraph lines.
Originally, it was received by being printed out on paper tape for
decoding (by sight) later. [This is where the terms "mark" and "space"
for data transmission come from.]

Soon, some operators found they could copy the code by listening to
the clicking of the machine that marked the tape. Soon the tape
receiving machine was eliminated entirely, and replaced by a "sounder"
which made a clicking sound whenever the sending key was pressed or
released.

Originally, the same code was used for radio transmission. However,
it sounded quite different: Instead of a click every time the key was
pressed or released, there was a continuous tone (or noise) whenever
the key was closed. The old land-line Morse code was not well-suited
for this. Its timing was more complicated than the modern code:
An "o" for example was "dit - short space - dit" which sounded too
much like the letter "e" sent twice. Similarly, some characters had
"long dashes." The number 9, for example, was "long dash - dit".
Even today, you often hear people use "n" (dash - dit) as an
abbreviation for a 9.

I believe the Europeans were the first to use the new code. It was
known in the US as "Continental code." Nowdays, since the old
land-line American Morse code is no longer used, the term
"Morse code" is understood to mean "Continental code."

4047. Cleaners/De-greasers

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-30 19:07:43 UTC
From: pjml@swmis.nerc-swindon.ac.UK
Message-ID: <23249.9207011005@swmis.nsw.ac.uk>
Source record: 287982

I have found that for many components such as ceramic switches, variable capacitors etc. the easiest way to de-grease them is to boil them in a pan of water on a stove. This may melt plastic parts though; use at your own risk.
For other components, an ultrasonic cleaning bath, using water and a commercial detergent (we use some stuff called 'MS222') is great. I avoid using organic solvents - apart from some of them being carcinogenic, they may damage plastic components, or in some cases leave a conductive residue behind; this can be very tenacious if it gets absorbed into the surface of unglazed ceramic, and quite a few high-voltage applications resent having all their switch-contacts being bridged by what constitutes a 50K-ohm resistor...
If you dont have an ultrasonic bath, try befriending an old-style watch or clock repairer, and asking if you can use his.

For really filthy equipment (old antenna-tuners that have spent the last ten years in an attic..) i suggest a couple of cycles in a dishwasher. This also works great for cleaning up aluminum engine parts (carburetors, valve-lifters and such).

Source record: 288053

I used to be an Electronics Technician in the Oklahoma State University Audio Visual Department. Sometimes, somebody would bring something truly nasty for us to work on. I remember one of my shopmates almost coming unglued when a hurd of cocroaches piled out of the little control door over the tuner on a VCR. There were mashed roaches gumming up the thread ring, that large circular gear which moves the guide posts into place, and their goopy little bodies pretty well kept the ring from turning.
The first line of defense was a liberal bath of Blue Shower, a degreaser and solvant designed to leave no residue. The roaches which were still alive convulsed and died as soon as the solvant hit. The Blue Shower washed all the goo away and a few healthy whacks knocked the remaining roaches onto the ground.
After that, the remainder of the job consisted of carefully lubricating any parts which were supposed to be lubricated since the Blue Shower pretty-well got rid of all lubricants. A service manual is good, at this point, since it will suggest the correct lubricants for the various mechanical contact points.
In the case of the antenna tuner, a similar treatment will probably work. Try to find a solvant like Blue Shower which is fairly safe to humans and really does seem to get surfaces clean. If possible, be careful around plastic parts since the solvant may damage them. When everything is clean, use WD40 to put a little lubricant back into the controls. Don't use TV tuner cleaner on pots because the grit in the cleaner will scower the carbon element right off, eventually and the potentioomeeter will need to be replaced.

|>
|>Randy Padawer
|>WA4FJF
|>
|>RPADAWER@UTKVX.UTK.EDU

On the TS-440, fixing the medium wave sensitivity does not involve a diode. What you need to do there is to remove the 20 dB attenuator that's included in the front end bandpass filter for that band. It's a "pi" type attenuator; cut out the two resistors to ground and replace the third resistor by a jumper.

I haven't see the TS-450 schematics, but it seems likely that the same would apply there. Get a service manual (good idea anyway) and look in the receive RF section. If the situation is similar to the TS-440, it will be quite obvious.

>Mike, N4PDY
>
>************************
>* These are my opinions only.*
>************************

You can also find a perfectly functional straight key for under $2 at a hamfest. The difference is that the more expensive ones tend to be "classics" or "antiques". Some people like collecting old, finely crafted things for that reason alone. I have a collection of about 5 straight keys that I bought for various reasons. A couple are just good, functional keys. The brass one looks great and kind of like something someone would have used around the turn of the century. I don't NEED 5 keys in my shack, I just like them. I only use one of them regularly for QSOs.

Asking why someone would pay $50 for a J45 is like asking why someone would pay thousands for an antique Chippendale end table. Not only is the J45 a lot cheaper, it is also much more useful IMHO :)

4056. ATV repeater help

Newsgroup: rec.radio.amateur.misc
Date: 1992-06-30 21:30:11 UTC
From: look@s45.csrd.uiuc.edu
Message-ID: <1992Jun30.213011.2711@csrd.uiuc.edu>
Source record: 288061

We are working to put up an ATV repeater here in Champaign. The input
will be on 439.25 and output on 426.25. We have been experimenting with
a cavity duplexer working into one antenna. With six tuned cavities, we
still do not have enough isolation between tx and rx. At the moment, our
installation looks like this:

```
v
|
tx ---c-c-c--------+-------c-c-c--- rx
```

where the v is our antenna and the c's are cavities. I was looking in the
ARRL handbook at the hybrid ring used in FM repeaters and wondering if that
might be useful here. It seems like some addition isolation could be attained
by replacing the tee connector with ??? What kind of bandwidth is available
with the hybrid? Any possible solutions would be very much appreciated.

When I worked as a T.V. tech, we always used either Blue Shower, or a product by Rawn Chemicals...the only problem was it was R-12 (freon), and the price skyrocketed with the depletion of the ozone layer. The Blue Shower was also a little too strong, I rememeber a guy (ahem) wrecking a couple of tuners with the stuff. I miss the freon. (It was great on Earth Day, too!)
I don't really know about any of the other chemicals on the market, it has been a few years since I worried about the stuff.

Be careful what you list as free...I received eleven responses
and will choose randomly between them. Winner notified by E-mail.
I'm glad someone wants to use the thing! I hate throwing away
stuff that works perfectly.

73,

David, AD8Y

Depends on what you want to do as to what you buy. For repeater use, 2m is the most used. In some areas away from the big cities where there are less hams, 2 meters is about the only thing in town. 440 is getting more popular as 2m gets crowded. Buy a dual bander if you can afford it. If not, get 2m. 2m is also where a lot of the packet resides also. 440 is where ATV is done.

The ARRL repeater guide for $6.00 is a must for traveling. Check a magazine for ARRL books that you can order. The guide will tell you where all the repeaters are on all the bands and some info about that repeater. It also has packet frequencies in it.

There is lots more to ham, but this is where I started. Good luck.

As for as buying the HTX 202, I have never considered doing that. However, my complaint is that the people going into our local Radio Shacks seem to use and ker-chunk our repeaters, I guess to see if they work. I could add that they shouldn't be using the area repeaters for that purpose. I even visited one store and found some local simplex frequencies on 2 meters stored in a few of the HT's. Now considering that someone harrassed us for 3 weeks on that simplex frequency until we triangulated the signal and then changed frequencies, I really believe that they should not be operated at all in the stores. I say, buy it, take it home and then try it out. We have had a couple of guys who decided to start using them before getting their license or call from the FCC. I am *NOT* against the No-Code Techs, I am though against the problems we have from the local retailer allowing thier use like that, though. I guess enough said, Huh?

Would the person whose house in the middle of no-where fell on his wife
and radio who had to build a cw transmitter and converter for the am
radio in his car out of the left-over parts so he could call for an
ambulance and rescue team from 100 miles away please raise his hand?
Thank you.

>>>license.

>This is a bogus metaphor, since Hollerith cards, while still used in a few
>places, have no real advantage.

Oho, haven't you hit the second year "real-world data storage" course
yet or are they no longer teaching it at Maryland? While a punchcard
may not have the information storage density of most magnetic media,
they also have minimal long-term storage requirements. As to being
used in "a few places", I can think of EXEC-8 and VM/CMS as two
operating systems still in use at a number of large-scale installations
that still use 80-column punchcard images as the basis for their
fixed-record text processing. The majority of business data is stored
in the form of fixed-length records. 90% of the software in the world
is written in Cobol.

Take a drive out to Gaithersburg, find what used to be called NBS and
ask some physicists or the computer center folks there what a "dusty
deck" Fortran program is.

>CW is a valid, useful communications
>mode, and is still the best way to put a signal through with minimum
>power under worst-case communications environment.

And a slide rule is a valid, useful tool for calculating numbers, and is
still the best way to find an answer in a worst-case mathematics
environment:

* you've run out of batteries for your HP-41CV and you don't have
enough time to buy more before your pipe stress analysis final

* someone set off an atomic bomb in your city and you
need to know the volume of a 7.3km diameter circular

cone that is 10km deep

* it's dark and there isn't enough light to read the LCD display
but if your heater uses 2 Firkins of fuel per 3 minutes of
operation at 276K and it uses 0.1 Imperial Gallons per 3
minutes at 290K, how much fuel do you need to keep the
temperature at 280K between midnight and 5 a.m.?

* you've just spent three weeks slogging through the jungles of
south-east asia and everything you have has been permeated with
mud but you still need to calculate the launch elevation of your
mortar to blow up the "unfriendlies" on the other side of the hill

* someone ran over your calculator with their car and you need to
calculate when their licence was issued given that your plate
number is PNU-574132, and that license plates are issued
sequentially at the rate of 20 per day

* you left your calculator in your back pocket for three weeks and
now the display doesn't work unless you hold it *just right* yet
you need one hand to support yourself to read the poorly-mounted
LCD display on the gas pump while you're calculating the number
of furlongs per gill of gasoline your car is getting

* the guards at the airport wouldn't let you bring the calculator
on the flight because it might contain plastic explosives but
you still want to compute the rate of progress of your trip
based upon well-known landmarks

>>No we shouldn't. And while we're at it, we should eliminate arithmetic
>>from the elementary school curriculum and teach them to use calculators
>>instead. And for highschool/college students, why teach them calculus
>>when they can use Mathematica?

>This is bogus also. You have to know calculus to use Mathematica, as you
>have to know arithmetical concepts to use a calculator.

Or a slide-rule for that matter, but the reactionary high school
chemistry and physics teachers of the 1970s resisted calculators as
long as they could, making it easier to use slide rules by requiring
more precise answers from the pocket-calculator crowd. I had both. I
used my slide rule because it was easier.

>However, there is no reason why we have to teach kids to
>do 13 integrations per minute. 5 is just fine. They understand
>the concept, will use Mathematica to do 99% of their integrations,
>(at 56K integrations/minute, by the way!)
>and that 1% of the time the computer is down, they can still do
>their integrations, but maybe not as fast as a professional
>mathematician.

It's a well known fact that Negroes, Mexicans, Homosexuals, Jews,
Catholics, women and the Irish can't learn code faster than 5WPM --

what better way to keep them out of the "crowded" portions of the bands?

>Guess why I'm learning 13 WPM? Cause Mr. s-number is on the way down.
>Will I use CW on the HF bands when I upgrade? Nope! I'll leave that
>to the people who use and enjoy CW.

>de N3HAU
>pro-choice on CW

Hear hear - if it was so wonderful, why do they ram it down your throat? And, Mal, telling me "you don't understand" wouldn't make me understand even if I didn't understand -- if you have something to say to me, you can say it right here, in public.

Albert Einstein, when asked to describe radio, replied: "You see, wire telegraph is a kind of a very, very long cat. You pull his tail in New York and his head is meowing in Los Angeles. Do you understand this? And radio operates exactly the same way: you send signals here, they receive them there. The only difference is that there is no cat."
